Sebiell and Butler<sup>1</sup> in their classic discussion described the criteria for the diagnosis of ariboflavinosis in the human being. Among the signs pointed out by them were certain changes in the mucous membranes of the lips and the skin at the angles of the mouth, which they called a cheilosis. More specifically, there was a maceration in each angle of the mouth, the lips were reddened along the line of closure and the mucosa appeared thin, shiny and denuded. In addition to the lesions on the lips there was also a scaly, greasy desquamation in the nasolabial folds, on the alae nasi in the vestibule of the nose and in a few instances on the ears and eyelids. These lesions disappeared in twenty days or less when the patients were given from 0.025 to 0.075 mg of riboflavin per kilogram of body weight.

In addition to the cheilosis, Kruse, Sydenstricker, Sebrell and Cleckley<sup>2</sup> have described a specific type of glossitis associated with ariboflavinosis. The tongue is clean, the papillae are flattened or mushroom shaped and the color is purplish red or magenta. In addition they described ocular lesions consisting of circumcorneal injection and a vascularizing keratitis involving the limbic plexus. To this array of signs and symptoms can be further added the subjective sense of a burning tongue.

The identification of these obvious lesions seemed a comparatively simple procedure. The recognition of ariboflavinosis and its correction seemed assured. However, we have collected a group of 34 cases of a disorder that apparently conformed to this syndrome but contrary to our expectations did not respond to riboflavin therapy. This led to the supposition that we were dealing with an irreversible stage of the syndrome, that the diagnosis was incorrect or that the patients were not absorbing the medication from the gastrointestinal tract. These patients were therefore subjected to further investigation.

A history of the diet was taken. The consumption of milk and milk products was unusually high in this group because of the fact that 32 of the 34 were edentulous and were using artificial dentures. For the same reason the meat consumption was low, but the protein intake was adequate. Slit lamp studies failed to reveal pathologic corneal vascularization in any of these patients. A vitamin B<sub>1</sub> load test<sup>3</sup> resulted in uniformly normal readings.

Other clues for disturbed metabolism that might be directly or indirectly attributable to avitaminosis were sought. This included determinations of blood count, electrocardiograms and gastric analyses. The results of these examinations were all within normal limits except for a few isolated instances in which the abnormality could be attributed to unrelated factors such as

electrocardiographic changes following acute myocardial infarction. The gastric analyses showed free acid in all but 1 patient who had previously had a gastric resection although many of the patients were over 50 years of age.

A therapeutic trial with orally administered riboflavin was again made in each case. The minimum dose of the riboflavin was 9 mg a day while some patients received as much as 25 mg a day for several months. Such doses are well above those generally accepted as therapeutically adequate. No clinical responses were observed. To preclude the possibility of malabsorption or destruction in the gastrointestinal tract 5 patients were given the drug parenterally, 10 mg of riboflavin<sup>4</sup> three times each week for eight weeks either intravenously or intramuscularly. No objective or subjective improvement in the labial or lingual lesions or burning of the tongue when present was observed. Additional vitamin therapy consisting of large amounts of nicotinic acid liver (by injection) and yeast tablets was then given, but again there was no demonstrable change in the lesion.

In the light of this lack of response to vitamin therapy, the cases and our studies on them were reviewed. The following pertinent facts appeared to explain the failure of therapy:

- 1 Although the lesions superficially resembled those described by Sebrell and Butler closer scrutiny revealed that those at the angles of the mouth were chronic in appearance heaped up deeply fissured and granulomatous, with no involvement of the lips. This contrasted with the superficially fissured, moist, angular stomatitis and associated cheilosis of ariboflavinosis.

- 2 None of these patients had ocular or seborrheic-like lesions.

- 3 These patients were all fairly well advanced in age 33 being over 40 and 28 over 50. Twenty-six of the 34 patients were females.

- 4 The lesions showed definite spontaneous remissions and exacerbations.

- 5 There were no evidences of any other vitamin deficiencies.

- 6 The usual factors that precipitate a vitamin deficiency were absent.

- 7 There was no response to intensive riboflavin therapy.

- 8 Thirty-two of the 34 had upper and lower artificial dentures.

We then sought for local causes of these lesions. The frequency of the presence of dentures appeared to implicate them in the pathogenesis of this syndrome. The presence of impurities in "undercured" vulcanite plates, mechanical factors, such as ill fitting dentures, and specific allergy to the components of the dentures had to be considered.

The impurities in the denture material consist chiefly of unbound sulfur and mercury, as well as an excess of mercury sulfide, resulting from improper vulcanization. Several authors<sup>5-7</sup> have reported cases of

glossodynia and lingual atrophy apparently caused by these impurities. It is our belief that these factors obtain in only a few cases.

More often these lesions which may be classified as perleche, arise as a result of improper oral mechanics, in particular an improper, too short vertical dimension. Thus, if the vertical dimension is too small, overclosure results: the upper lip overlaps the lower and produces creases at the corner of the mouth and sagging. In this way a pocket formation takes place at the angle of the lips. An excellent receptacle for saliva is formed, and the warm moist bed can become a medium for secondary fungus growth. These fungi help produce the cutaneous lesion of perleche. The associated glossodynia probably results from direct contact of the tongue with the overlying structure be it palate or denture. The presence of a plate narrows the available space for free movement of the tongue in an upward direction: this space is further diminished by the decreased vertical dimension, and so one can readily visualize the possibility of direct contact between tongue and denture. If the vertical dimension is sufficiently shortened as a result of malocclusion, then such contact may take place in the absence of dentures. These factors would account for the simultaneous therapeutic response of the perleche and glossodynia. Thus, Costen<sup>6</sup> reported 10 cases of glossodynia associated with malocclusion due to overbite and decreased vertical dimension, the condition in all his cases was cured by treating the underlying defect. Swenson<sup>7</sup> described a case of perleche associated with malocclusion that was cured by increasing the vertical dimension. As further evidence of the presence of deep creases and sagging is the fact that the lesions are not visible with the mouth closed and come into view only as the mouth is opened wide.

It would appear, then, that the perleche, and probably the glossitis as well, are due to mechanical factors rather than to the dentures. Ill fitting dentures result in a mechanical defect. Our 2 patients with perleche who did not have false teeth had mechanical defects to explain the lesions. The first was a woman aged 26 who had malocclusion, the other was a man aged 72 who was completely edentulous except for one tooth in the upper jaw, his upper lip sagged considerably and overlay the lower.

It is more than coincidental that one does not encounter perleche in patients who can afford better made and properly fitted dentures. For the most part the lesions herein described did not usually occur until some time, often several years, after the dentures had been worn. This is due to the associated bone resorption which is known to occur. To combat this influence, denture fitting should be checked from time to time.

It is fully appreciated that not in all cases of perleche is the condition due to mechanical causes. Also patients with dentures and malocclusion may have coincidental ariboflavinosis. Nevertheless, the frequency with which the syndrome we have described occurs makes it important to recognize. Thus unnecessary vitamin therapy may be avoided and the proper mechanical corrections instituted. Once there is awareness of this syndrome, the differential diagnosis between it and true ariboflavinosis is easily made.

SUMMARY

A syndrome of perlèche often associated with a smooth, burning tongue and resembling ariboflavinosis was observed  
The lesions do not respond to vitamin therapy  
The underlying cause appears to be a mechanical defect, so that there is a shortened vertical dimension with overclosure  
The mechanical defect most often results from ill fitting dentures  
Correction of the malocclusion is the indicated therapy

VISUAL RESULTS IN THE TRACHOMA CLINICS OF SOUTHERN ILLINOIS

HARRY S. GRADLE, M.D.  
CHICAGO

The trachoma clinics of southern Illinois were established "to prevent blindness by the control of trachoma in southern Illinois," and it seems fitting at this time to render an account of accomplishments. Consequently, only visual results will be considered in this article  
Every patient's vision was recorded on admission to the clinics and at regular intervals thereafter, both with and without glasses. The best possible vision is utilized for the statistics of this paper. As far as possible, the method of estimating and of recording the vision was kept uniform in the five clinics, and in consequence there was no necessity of recording the statistics from each clinic separately. All cases here dealt with have been

under observation for a minimum of two years, those in table 1 from 1938 to 1940 and those in table 2 from 1936 to 1938. The former group were treated with sulfanilamide exclusively, the latter group received no sulfanilamide but underwent the local treatment that was employed in the clinic (massage with chaulmoogra

oil, expression, silver nitrate, mercuric oxycyanide and all the other means deemed necessary in individual cases). Only stage 1 and stage 2 are included in this study, and consequently this paper deals with the results obtained in the treatment only of acute trachoma

COMMENT

The tables are self explanatory and need but little discussion. Attention should be called to the fact that in group 2 the percentage of patients who showed improvement of vision was only about one half that of group 1 (those treated with sulfanilamide), while the percentage of patients who lost vision was more than double that of group 1. Even more important is the fact that in both groups the number of eyes that became industrially blind (using the American Medical Association's definition of industrial blindness as being vision of less than 20/200) was less than 1 per cent.

SUMMARY

Acute trachoma (stage 1 and stage 2) can be treated so successfully that less than 1 per cent of the eye infected will become industrially blind  
From the final visual standpoint, systemic treatment with sulfanilamide is preferable to purely local treatment because (a) twice as many eyes show definite improvement in vision and (b) less than half as many eyes show positive losses in vision

Storage of Carbohydrate in the Body—When carbohydrate is absorbed in larger quantity than is required for the body's immediate needs for fuel, the surplus accumulates as glycogen, which is stored in the liver and muscles. The amount of carbohydrate which will be stored in the entire body after rest and liberal feeding is estimated at 300 to 400 grams. Thus the total amount of carbohydrate which can be stored as such in the body is no more than frequently taken in one day's food. When the body has a tendency to increase its store of glycogen the further storage of carbohydrates tends to be converted into fat.

### RENAL HEMODYNAMICS IN ORTHOSTATIC HYPOTENSION

#### EFFECTS OF ANGIOTONIN AND HEAD UP BED

A C CORCORAN M.D. J S BROWNING M.D. AND  
IRVINE H PAGE M.D. INDIANAPOLIS

Our purpose in the present report is to describe observations on the effects of postural changes and angiotonin injections on arterial pressure, pulse rate and renal hemodynamics in a patient who suffered from orthostatic hypotension and who was effectively treated by the head-up bed described by MacLean and Allen<sup>1</sup>. Briefly stated before treatment the patient responded to a tilt of 60 degrees by syncope, decreased arterial pressure and renal blood flow. Injection of angiotonin greatly increased the blood pressure and renal blood flow. This effect of angiotonin contrasts sharply with the renal ischemia which accompanies its pressor action in normotensive subjects. After two months treatment with the head up bed a tilt to 60 degrees did not cause syncope and renal blood flow was increased in spite of a transient decrease of arterial pressure. The injection of angiotonin at this time resulted in its characteristic pressor and renal vasoconstrictor effects.

The patient a Negro woman aged 40 developed orthostatic hypotension during prolonged convalescence from pneumonia. Syncope, hypotension and tachycardia developed immediately on her assuming the erect posture. She had therefore been confined to bed and wheelchair for some two months before the first observation (March 15, 1941 A 1 to 7 in the table). She was then directed to sleep in a bed whose head was raised at an angle of about 40 degrees to the floor. During the following weeks the onset of syncope on standing became progressively delayed. At the time of the second observation (May 17, B 1 to 6 in the table) standing with occasional movement, as in light housework, was tolerated without symptoms. Arterial pressure dropped sharply to levels of about 70 mm of mercury systolic and 55 mm diastolic on first standing but was restored to or above the level observed in the prone position within two to four minutes.

#### METHODS

Effective renal blood flow was calculated from plasma diodast clearance and the hematocrit ratio, the glomerular filtration rate from inulin clearance and the filtration fraction from the inulin/diodast clearance ratio. The postural changes were made on a tilt table.

#### RESULTS

**Before Treatment**—Renal blood flow, which was subnormal in the prone position, decreased, as did arterial pressure, when the patient was tilted to 40 and 60 degrees from the horizontal. The intense renal ischemia and hypotension recorded in the table in observation A 4 were associated with pallor and early syncope. Intravenous injection of angiotonin resulted in greatly increased arterial pressure, provoked the complaint of severe pulsation within the head and increased renal blood flow. Some part of this apparent increase of renal flow may possibly arise from a washing out of tubular fluid formed but not excreted during the preceding period of depressed filtration rate and oliguria. Intraglomerular pressure, as expressed in filtration fraction, was increased during the hypotensive phases at a 40 and at a 60 degree tilt. The injection of angiotonin decreased filtration fraction to a level slightly lower than was observed with the patient in the prone position. The pressor effect of the injection receded during eleven minutes. Some residue of protection apparently remained during the ensuing eighteen minutes of observation at a 60 and at a 40 degree tilt.

Miss Ellen Bowers R.N. assisted in making these observations. From the Lilly Laboratory for Clinical Research Indianapolis City Hospital.

J MacLean A.R. and Allen E.V. Orthostatic Hypotension and Orthostatic Tachycardia: Treatment with the Head Up Bed. *J A M A* 115: 2162 (Dec 21) 1940.

**After Treatment**—Tilting to 60 degrees after two months' adaptation to the erect posture by the head up bed resulted in transient drop of blood pressure and lasting increase of renal blood flow, the net renal change being not dissimilar to that observed during the action of angiotonin before treatment. Intravenous administration of angiotonin at this time caused slight precordial oppression, increased arterial pressure and decreased renal blood flow without significant change in filtration fraction over twelve minutes of pressor action. Renal blood flow and diastolic pressure remained somewhat elevated during the following ten minutes at a 60 degree tilt. Both values were restored to control levels when the patient assumed the prone position.

#### COMMENT

Our observations on the effects of treatment of orthostatic hypotension with the head-up bed of MacLean and Allen<sup>1</sup> extend and confirm their conclusions as to its value in restoring toward normal cardiovascular responsiveness to the erect posture. The increase of filtration fraction during tilting before treatment expresses an increase of intraglomerular pressure which is more probably the result of afferent arteriolar vaso-

\* The values of blood pressure and pulse are averages of consecutive readings during the time of observation indicated under minutes and do not represent the widest changes observed in any observation.

† By period is indicated the number of collections of urine represented in the corresponding data.

dilatation than of efferent vasoconstriction, since orthostatic hypotension is usually due to decreased vasoconstrictor responsiveness.<sup>2</sup> Such deficiency of normal vasoconstrictor response is suggested by the paradoxical effect of angiotonin in increasing renal blood flow and decreasing filtration fraction. Angiotonin, the effector agent of the renal pressor system,<sup>3</sup> normally excites renal efferent arteriolar vasoconstriction sufficiently to cause renal ischemia and to increase filtration fraction during its pressor action.<sup>4</sup> During the hypotensive phase before and the pressor state after injection of angiotonin, the normal lack of relation between blood pressure and renal blood flow was not maintained. It therefore appears that in this type of orthostatic hypotension normal autonomy of the renal circulation<sup>5</sup> is lost.

Restoration toward normal of vasoconstrictor responsiveness is indicated in the renal ischemia which followed injection of angiotonin during tilting after treatment, although the absence of change in filtration fraction at this time suggests a residual relative lack of efferent vasoconstriction.

The similarity between the effect of angiotonin before treatment and the response to tilting after treatment suggests that a physiologic function of the renal vasopressor system (renin, renin activator, angiotonin) may be sought in vascular adaptation to the erect posture and its shifts of arterial pressure and that failure of the renal pressor system may participate in some measure in the genesis of orthostatic hypotension. This view is supported by the observation that excessive release of renal pressor substance in experimental hypertension may occur in the absence of renal ischemia<sup>6</sup> as the result of decreased intrarenal pulsation.<sup>7</sup> Such a decrease of intrarenal pulsation may follow the decrease of pulse pressure which occurs on standing.

#### SUMMARY

Effective renal blood flow and arterial pressure decrease during the syncope of orthostatic hypotension. Injection of angiotonin at this time increases renal blood flow and blood pressure and relieves syncope. After treatment with the head-up bed, assumption of the erect posture results in only transient decrease of blood pressure and increased renal blood flow, with restoration of the fall in renal blood flow which normally accompanies the pressor effect of angiotonin.

## Council on Physical Therapy

THE COUNCIL ON PHYSICAL THERAPY HAS AUTHORIZED PUBLICATION OF THE FOLLOWING REPORT

HOWARD A. CARTER, Secretary

### HEIDBRINK BASSINET, KREISELMAN MODEL 20A (INFANT RESUSCITATOR), ACCEPTABLE

Manufacturer: The Ohio Chemical & Mfg. Company, 1177 Marquette Street, Cleveland

The Heidbrink Bassinet, Kreiselman Model 20A, is designed for treatment of premature infants or all infants requiring administration of continuous flow oxygen. The apparatus provides for resuscitation, inhalation and aspiration. Mounted on a heavy two post stand with large casters, the unit includes an operative head with automat, manometer and flowmeter, two yoke automatic regulator for D or E size gas tanks, electrically warmed bassinet with large drawer, perforated tray adjustable up and down at both ends, mattress, electrically operated aspirator, infant size inhalation inhaler, infant size catheter adapter and intratracheal catheter tubings, handwheel wrench. The motor is of explosion proof design. Shipping weight is 175 pounds. The apparatus operates on alternating current. Only positive pressure is provided. There is no negative pressure developed at the face piece.

Temperature in the bassinet is automatically controlled by a thermostat, a thumb screw adjustment permits manual selection of temperatures ranging from 80 to 110 F. Relative humidity as high as 50 per cent, and higher is obtained by adjusting the valve of the humidifier attached to the under side of the bassinet. According to the firm, an infant may be maintained in the Heidbrink Bassinet under safe and proper conditions of warmth, humidity and oxygen rich atmosphere for indefinite periods of time.

Oxygen flow is regulated by a needle valve and is indicated on a dry float kinetic type flowmeter calibrated up to 16 liters per minute. The humidified oxygen is delivered directly into the head hood suspended over one end of the bassinet. This arrangement is said to confine the oxygen rich atmosphere within a small area and to give the patient immediate benefits

of any change in dosage or humidity. Openings in the top of the head hood provide for the admission of normal air should the oxygen flow be interrupted or the supply exhausted.

For resuscitation, the automat is adjusted to deliver the selected positive pressure considered safe, and the safety escape valve of the water manometer is set. The water manometer is filled by pouring distilled water into the cup of the escape valve until the water rises in the manometer gage glass to the 0 calibration.

When the positive pressure is set according to directions recommended by the firm, the soft latex resuscitation inhaler is placed over the infant's face, the breathing tube extending over the tongue into the pharynx, with the chin held up. The lever on the resuscitation inhaler is depressed and held down for several seconds, or long enough for the lungs to be inflated plus a second or two. The lever is then released and the lungs deflate because of their own elasticity.

When breathing has been established but oxygen is still needed, the resuscitation inhaler with attached airway removed, the continuous flow inhaler is placed over the nose and mouth and the flowmeter is set at 4 liters per minute by adjusting the needle valve marked "Oxygen On-Off."

The aspirator motor switch is located on the side of the bassinet, and vacuum is controlled by the thumbscrew adjacent to the vacuum gage on the pump. The oil cup must be filled with high grade medium heavy (S A E 30) oil. A metal cup attached to the left side of the pump catches any drippings of oil from the pump.

Two switches at the foot end of the bassinet operate the light bulbs used for warming purposes. Each switch controls two bulbs. The mattress in the bassinet may be adjusted to various degrees of Trendelenburg posture.

In the Council's clinical examination of the unit, it was found to give satisfactory clinical service in each of its functions as a resuscitator, aspirator, incubator and for administration of continuous flow oxygen. The delivery room personnel of the hospital where the investigation was conducted made some objection to the apparatus in that it appeared unduly large and cumbersome. However, this objection may be considered unjustified because several necessary pieces of delivery room equipment have been successfully combined in one unit.

The Council voted to accept the Heidbrink Bassinet, Kreiselman Model 20A, for inclusion on its list of accepted devices.

## Council on Pharmacy and Chemistry

### NEW AND NONOFFICIAL REMEDIES

THE FOLLOWING ADDITIONAL ARTICLES HAVE BEEN ACCEPTED AS CONFORMING TO THE RULES OF THE COUNCIL ON PHARMACY AND CHEMISTRY OF THE AMERICAN MEDICAL ASSOCIATION FOR ADMISSION TO NEW AND NONOFFICIAL REMEDIES. A COPY OF THE RULES ON WHICH THE COUNCIL BASES ITS ACTION WILL BE SENT ON APPLICATION.

AUSTIN F. SMITH, M.D., Acting Secretary

**SULFADIAZINE SODIUM**—The sodium salt of 2-sulfamoyl-4-amino-6-methylpyrimidine— $C_{10}H_9N_4O_2SNa$  (M W 272.26)

**Actions and Uses**—The monohydrate sodium salt of sulfadiazine has the same therapeutic properties as does sulfadiazine. At the present time its use can be recommended only in pneumococcal, streptococcal, meningococcal, *Escherichia coli* and Friedlander's bacillus infections.

Solutions of sulfadiazine sodium in distilled water are slightly alkaline and have a pH ranging from 9 to 10. When a 5 per cent solution of this drug is injected intravenously, the solution is promptly split off, leaving sulfadiazine. Thus, in final analysis, the sodium salt of sulfadiazine represents a method of introducing the poorly soluble sulfadiazine intravenously. The drug, being alkaline, is definitely irritant to the tissues and hence should never be given except by the intrathecal or any other parenteral route, necrosis and sloughing of the tissues may take place.

The administration of 5 per cent solution of sodium by the intravenous route is indicated in the treatment of severe and severe pneumococcal infections in which it is necessary to obtain promptly adequate blood concentration.

<sup>6</sup> Corcoran, A. C., and Page, I. H. Renal Blood Flow in Experimental Renal Hypertension, *Am J Physiol* 135: 361 1941-1942.

<sup>7</sup> Kohlstaedt, K. G., and Page, I. H. The Liberation of Renin by Perfusion of Kidneys Following Reduction of Pulse Pressure, *J Exper Med* 72: 201 (Dec 21) 1940.

in patients who by reason of vomiting are not obtaining proper concentrations of the drug when it is given by mouth in patients in whom the absorption of the drug is poor so that adequate concentrations of sulfadiazine cannot be obtained, and finally in patients who have undergone surgical procedures on the upper gastrointestinal tract and in whom the administration of the drug by mouth is contraindicated. With the exception of patients who are vomiting or in surgical cases it is rarely necessary to use intravenous injections of solutions of sulfadiazine sodium more than once or twice. Frequent and repeated injections of the drug are generally not advisable because such injections tend to produce thrombosis of the veins.

**Dosage.**—The intravenous injection of 0.01 Gm per kilogram of body weight of the sodium salt of sulfadiazine will produce quickly a concentration of approximately 1 mg of sulfadiazine per hundred cubic centimeters of blood. The initial dose of the drug for patients severely ill with pneumococcal infections is based on 0.10 Gm per kilogram of body weight this to be followed immediately and every four hours thereafter by 1 Gm of sulfadiazine by mouth. It does not seem advisable to use oral therapy with sulfadiazine doses based on 0.03 to 0.05 Gm per kilogram of body weight of sodium sulfadiazine may be administered by the intravenous route at twelve hour intervals. Such doses will maintain the concentration of the drug at between 10 and 15 mg per hundred cubic centimeters.

In preparing solutions of sodium sulfadiazine the drug is weighed out and is then dissolved in sufficient sterile distilled water to make a 5 per cent solution. This should not be sterilized by boiling or autoclaving because the sodium salt is unstable under such conditions. The sodium salt of sulfadiazine should not be dissolved in sterile isotonic solutions of sodium chloride, dextrose or any other types of solutions which are used parenterally. Solutions of this drug should be administered only intravenously and at the rate of 5 cc per minute. Solutions of sulfadiazine sodium should always be given separately and in different containers from other parenteral fluids. In other words solutions of the drug should not be poured into containers which have been used for other parenteral solutions. It should never be poured into a transfusion bottle either preceding during or just after a blood transfusion. When the sodium salt of sulfadiazine is being used, frequent determinations of the concentration of the drug in the blood should be made by the method described by Bratton and Marshall (*J Biol Chem* 128 537 [May 1939]).

#### Tests and Standards—

Sulfadiazine sodium is a white odorless powder having a bitter taste. It is very soluble in water, soluble in alcohol and insoluble in ether or chloroform. Aqueous solutions may absorb sufficient carbon dioxide to cause precipitation of sulfadiazine. Sulfadiazine sodium is not hygroscopic at 25 C if the relative humidity does not exceed 50 per cent.

Acidify an aqueous solution of sulfadiazine sodium with acetic acid filter wash the residue with distilled water and dry at 100 C. The dried precipitate meets the tests for identity given under Sulfadiazine N N R.

Sulfadiazine sodium meets the requirements for chloride sulfate heavy metals and moisture content given under Sulfadiazine N N R. Incinerate 0.2 Gm of sulfadiazine sodium with the addition of 0.5 cc of concentrated sulfuric acid. Ignite until the carbon residue has been burned off add 0.5 cc of concentrated sulfuric acid heat gently to drive off the excess acid and ignite to constant weight at 600 C. The sodium content calculated from the weight of sodium sulfate residue is not less than 8.2 nor more than 8.6 per cent. The nitrogen content of dried sulfadiazine sodium is not less than 20.3 nor more than 20.7 per cent.

Dissolve about 0.5 Gm of sulfadiazine sodium in 10 cc of distilled water and 10 cc of concentrated hydrochloric acid contained in a 400 cc beaker dilute to 50 cc cool to 15 C and titrate with tenth molar sodium nitrite solution.

The endpoint is the first immediate blue streak obtained when a glass rod dipped into the solution is drawn across a smear of starch iodide paste on white filter paper (or a clear glass plate). The solution should retain this endpoint for thirty seconds. Each cubic centimeter of tenth molar sodium nitrite corresponds to 0.02723 Gm of anhydrous sulfadiazine sodium. The amount of sulfadiazine sodium found corresponds to not less than 99.0 per cent nor more than 101.0 per cent calculated on the dried basis.

LEDERER LABORATORIES, INC., PEARL RIVER, N Y  
Patent applied for

Sulfadiazine Sodium (Powder) 5 Gm bottle

MENADIONE (See THE JOURNAL Jan 17, 1942 p 226)

The following dosage forms have been accepted

THE LAKESIDE LABORATORIES, INC., MILWAUKEE

Ampules Menadione (in oil) 1 mg and 2 mg 1 cc Each cubic centimeter contains menadione dissolved in sesame oil containing 0.5 per cent chlorobutanol

Capsules Menadione (in corn oil) 2 mg

LACTATE RINGER'S SOLUTION (See THE JOURNAL Jan 17, 1942, p 226)

The following dosage forms have been accepted

ABBOTT LABORATORIES, NORTH CHICAGO, ILL

Lactate Ringer's Solution 500 cc and 1000 cc bottles Each hundred cubic centimeters contains sodium lactate 0.31 Gm, sodium chloride U S P 0.6 Gm, potassium chloride N F 0.03 Gm and calcium chloride U S P 0.02 Gm

THE UPJOHN COMPANY, KALAMAZOO, MICH

Lactate Ringer's Solution in Upjohn Infusion Bottles 500 cc, 1000 cc and 2000 cc Each hundred cubic centimeters contains sodium lactate 0.31 Gm, sodium chloride 0.6 Gm, potassium chloride 0.04 Gm and calcium chloride 0.02 Gm in redistilled water

DEXTROSE (See New and Nonofficial Remedies, 1941 p 179)

The following dosage forms have been accepted

ABBOTT LABORATORIES, NORTH CHICAGO, ILL

Dextrose 10% W/V in Lactate Ringer's Solution 500 cc and 1000 cc bottles Each hundred cubic centimeters contains dextrose U S P 10 Gm, sodium lactate 0.31 Gm, sodium chloride U S P 0.6 Gm, potassium chloride N F 0.03 Gm and calcium chloride U S P 0.02 Gm

DON BAXTER, INC GLENDALE CALIF

Dextrose 5% W/V in Lactate Ringer's Solution 500 cc and 1000 cc Vacoliter containers Each hundred cubic centimeters contains dextrose 5.0 Gm, sodium lactate 0.31 Gm, sodium chloride 0.6 Gm, potassium chloride 0.03 Gm and calcium chloride 0.02 Gm

Dextrose 10% W/V in Lactate Ringer's Solution 500 cc and 1000 cc Vacoliter containers Each hundred cubic centimeters contains dextrose 10.0 Gm, sodium lactate 0.31 Gm, sodium chloride 0.6 Gm, potassium chloride 0.03 Gm and calcium chloride 0.02 Gm

THE UPJOHN COMPANY, KALAMAZOO, MICH

Dextrose 5% W/V in Lactate Ringer's Solution in Upjohn Infusion Bottles 500 cc, 1000 cc and 2,000 cc Each hundred cubic centimeters contains dextrose U S P 5.0 Gm, sodium lactate 0.31 Gm, sodium chloride 0.6 Gm, potassium chloride 0.03 Gm and calcium chloride 0.02 Gm

Dextrose 10% W/V in Lactate Ringer's Solution in Upjohn Infusion Bottles 500 cc, 1000 cc and 2,000 cc Each hundred cubic centimeters contains dextrose U S P 10 Gm, sodium lactate 0.31 Gm, sodium chloride 0.6 Gm, potassium chloride 0.03 Gm and calcium chloride 0.02 Gm

CALCIUM GLUCONATE (See New and Nonofficial Remedies 1941, p 176)

The following dosage form has been accepted

THE LAKESIDE LABORATORIES, INC., MILWAUKEE

Ampul Solution of Calcium Gluconate 10% W/V Stabilized with Calcium d-Saccharate 0.5% W/V 10 cc Each ampul contains a sterile distilled water solution of calcium gluconate U S P 10 Gm, stabilized with calcium d-saccharate 0.05 Gm (For tests and standards of calcium d-saccharate see THE JOURNAL April 4 1942 p 1216)

SERUMS AND VACCINES, DIAGNOSTIC AGENTS (See New and Nonofficial Remedies 1941, p 481)

TRICHINELLA EXTRACT—Trichinella extract is diluted saline extraction of clean Trichinella larvae prepared by artificial digestion of muscles of heavily infested experimental animals. The extract is adjusted to neutrality and sterilized by filtration.

**Actions and Uses.**—Trichinella extract is used for making the intradermal diagnostic skin test in the diagnosis of trichinosis. An immediate or delayed type of positive reaction may result from the intradermal injection of 0.1 cc of the diluted antigen, depending on the duration of the illness.

ELI LILLY & COMPANY, INDIANAPOLIS

Trichinella Extract Marketed in packages of two 1 cc vials one vial of Trichinella Extract 1:10,000 dilution in isotonic solution of sodium chloride, and one control vial of isotonic solution of sodium chloride used as extracting fluid. Both extract and control solution contain Merthiolate (Sodium Ethyl Mercuri Thiosalicylate Lilly) 1:20,000 as a preservative.

## INTRAPERITONEAL ADMINISTRATION OF SULFANILAMIDE

Animal experiments of Key and Burford, Jensen, Johnsrud and Nelson, Key and Frankel have demonstrated that local application of sulfonamide drugs does not interfere with the healing of bones, muscles, connective tissue, joints, pleura and peritoneum. Introduction of sulfonamide drugs into the normal peritoneal cavity of mice (Throckmorton) caused a gradual increase of mononuclear phagocytes of the type elicited by only the mildest of irritants. Rae found, in his studies on experimental peritonitis in rabbits, that sulfanilamide is most effective in the preperitonitis stage. Rosenberg and Wall concluded from their experiments on rats that sulfanilamide is not irritating to the peritoneum and apparently is not harmful to the human body. Pearl and Ricketts, by intraperitoneal use of sulfathiazole, controlled peritonitis produced in the rat by inoculation of a pure culture of hemolytic *Escherichia coli*. In the experiments of Harbison and Key, local application of sulfanilamide did not appreciably delay the healing or decrease the tensile strength of a wound or tend to cause peritoneal adhesions.

Organisms commonly cultured from the peritoneum in perforative appendicitis are *Escherichia coli*, hemolytic and nonhemolytic streptococci and occasionally *Clostridium perfringens*, against all of which the drugs of the sulfonamide group are effective. Ravdin, Rhoads and Lockwood<sup>1</sup> reduced the mortality rate of 1.5 per cent in a series of 880 consecutive cases of acute appendicitis to that of 0.4 per cent in a series of 257 cases by instituting sulfanilamide therapy of cases in which there was spreading peritonitis. The drug was administered hypodermically in an 0.8 per cent concentration in isotonic solution of sodium chloride.

Dees<sup>2</sup> was probably the first to use sulfanilamide powder intraperitoneally. He treated 25 cases of vary-

ing degrees of peritonitis by pouring 20 Gm of sulfanilamide into the area of infection at the time of operation. Cyanosis and jaundice were observed in a few instances but cleared rapidly. Only one death occurred. Griswold and Antonic<sup>3</sup> treated 111 cases of perforated peptic ulcer. From 5 to 10 Gm of sulfanilamide crystals was sprinkled about the lesions, and 3 to 5 Gm was implanted in the abdominal wall. In this series were twenty fatalities. Thompson, Brabson and Walker<sup>4</sup> treated 59 cases of acute, diffuse appendical peritonitis by placing 8 Gm of sulfanilamide into the peritoneal cavity and 4 Gm in the layers of the abdominal wall. In cases of appendical abscess they considered it safe to use as much as 20 Gm total of the drug. Among these 59 cases some seemed hopeless. From 1935 to 1939 741 cases of acute suppurative appendicitis were treated at the Roosevelt Hospital, New York City, with twenty deaths, a mortality rate of 2.7 per cent. During 1940 with intraperitoneal sulfanilamide therapy there were 204 consecutive cases in which operations were performed without a fatality. The dramatic reduction in mortality rate in 1940, the authors felt, was directly due to sulfanilamide. Kinney<sup>5</sup> operated in 45 cases of generalized peritonitis with only one death. Some of the cases were of the gravest type. Toxic effects were not noted. The improvement in the results, the author felt, was due to the use of sulfanilamide in the peritoneal cavity. A local concentration of from seventy-five to one hundred times higher than systemic concentrations may be obtained by direct application of sulfanilamide at the source of infection, according to Mueller and Thompson<sup>6</sup>. They placed 10 Gm of the drug in the peritoneal cavity and sprinkled 5 Gm in the layers of the abdominal wall. This, they believe, increased the rapidity of wound healing in cases of purulent infection. For young children and infants a dose of 3 to 4 Gm is suggested. The dose may be calculated on the basis of 175 mg per kilogram of body weight. Absorption of the drug from the peritoneal cavity is rapid and reaches its peak in from ten to eighteen hours, averaging 7 mg per hundred cubic centimeters of blood. Samples of peritoneal fluid exhibited levels of from 300 to 800 mg per hundred cubic centimeters for more than forty hours postoperatively. Such a degree of concentration cannot be obtained by any other form of administration of the drug and is probably the chief factor in controlling the infection. Mortality rate in 742 surgical cases of acute appendicitis between 1935

and 1939 at the Roosevelt Hospital amounted to 283 per cent. With sulfanilamide since January 1940 there have been 400 consecutive surgical cases of acute appendicitis at the Roosevelt Hospital without a death. Jackson and Collier<sup>7</sup> emphasize that sulfanilamide applied locally in the peritoneal cavity is most effective in the invasive stage of infection. It is far less effective in the presence of frank suppuration for as Lockwood has demonstrated its action is inhibited by peptones. They therefore feel that its use is particularly indicated when open incisions have been made when there has been accidental soiling of the peritoneum, and when a walled off abscess has been broken into and the remainder of the abdomen exposed to contamination. Absorption of the drug from relatively normal peritoneal cavities was so rapid as to raise a doubt as to the analogy of its action here and in other parts of the body. In man 5 Gm intraperitoneally gave a concentration of almost 10 mg per hundred cubic centimeters in about two hours and at twenty-four hours levels below 2 mg per hundred cubic centimeters were found. However, in the presence of an infection the absorption is much slower. Sixty-two patients received sulfanilamide intraperitoneally and 29 of these were given the drug intravenously or orally for one or more days. There were three fatalities which the authors felt might have been avoided if sulfanilamide had been continued. None of the patients receiving only the intraperitoneal dose of the drug showed any toxic signs. Among the 29 patients who received additional sulfanilamide, jaundice developed in 9. Administration of the drug was stopped and jaundice disappeared. Hepatitis has often been observed in the course of sulfanilamide therapy. The question arose whether the intraperitoneal application of the drug might be more apt to lead to hepatitis than administration by other routes. Jackson and Collier found in experiments on dogs that the concentration of the drug in the portal vein was forty times greater than in the jugular vein. There may be a special affinity of the liver for the drug. The peritoneal administration of the drug offers the fastest method of raising the concentration in the blood to effective levels. To avoid damage to the liver the authors suggest that an interval of eighteen hours or more should elapse before giving sulfanilamide after the initial 5 mg peritoneally. Tashiro and his associates<sup>8</sup> stress the necessity of thorough cleansing and aspiration of pus and infectious material from the abdomen in order to remove the inhibiting substances (peptones). Crystalline sulfanilamide in amounts of 4 to 10 Gm, depending on the patient's age, was implanted at the area of greatest

infection, with 2 or 3 Gm used to coat the wound layers and the surface before closure. Since the adoption of this therapy the authors have closed most of the suppurating cases without drains, securing primary wound healing and a smooth postoperative convalescence. There was no depreciation in leukocytosis and no toxic manifestations. There was no fatality in 18 cases of ruptured appendix with peritonitis treated in this manner. In the experience of Hudson and Smith,<sup>9</sup> intravenous and intramuscular chemotherapy gave disappointing results in many cases of spreading peritonitis, the fatality rate reaching the figure of 55.5 per cent. Since the adoption of intraperitoneal sulfanilamide therapy as a routine procedure in similar cases, the mortality has been reduced to 8.3 per cent. Jaundice was not observed in their series of 125 cases. The consensus is clearly that intraperitoneal sulfanilamide is an extremely valuable weapon in the treatment of potential or established peritonitis.

### INSECT BORNE VACCINE

A new epidemiologic approach is suggested in recent attempts by Hammon and his associates<sup>1</sup> of the Hooper Foundation, University of California, to reproduce the natural mode of infection of horses with St. Louis encephalitis virus. A widespread infection of horses and other animals of the Pacific Coast with St. Louis encephalitis is apparent from numerous serologic surveys. Titrations of 69 horse bloods from western states, for example, showed 49 (70 per cent) of the bloods containing antibodies of sufficiently high titer to neutralize the St. Louis virus *in vitro*. Cox and his co-workers<sup>2</sup> had previously found that horses without such antibodies developed typical encephalomyelitis on intracerebral injection of the St. Louis virus, while antibody containing horses were immune to such injection. Horses convalescent from the experimental intracerebral inoculation invariably developed relatively high titer specific antibodies against the virus. During the terminal phase of experimental disease the virus was occasionally isolated from nasal washings but was never demonstrated in the circulating blood. Contact with nasal secretions therefore was the only method of spread of this disease suggested by the earlier investigators.

A different method of spread, however, was indicated by the repeated isolation<sup>3</sup> of the St. Louis virus from one species of mosquitoes (*Culex tarsalis*) of the Yakima Valley, Washington, all other biting insects of this region being negative. This strongly suggests

that culex transmission is the main factor in bringing about the wide dissemination of the virus among wild and domestic animals of western states

To test this possibility a number of wild, unbroken colts were imported from an uninhabited mountainous region of Nevada, an area statistically free from the St. Louis virus. The serums of these horses were free from homologous antibodies at the time of their importation. St. Louis virus isolated from Yakima mosquitoes was used for the inoculation tests and employed in its first and second mouse brain passage. Each brain was emulsified in ten volumes of broth containing 5 per cent of sheep serum. Certain horses were given 3 cc of the resulting virus suspension intranasally. Others were inoculated subcutaneously (very superficially) with 3 cc of a 1:10,000 dilution of the same suspension, the dose being planned to approximate a possible single mosquito inoculation. Control horses were inoculated intracerebrally with the suspension, with a number of uninoculated controls kept in a separate corral.

Bleedings were begun with all horses twelve hours after the inoculation and continued twice daily for fifteen days. Nasal washings were made once daily. Virus was not isolated from the nasal washings of any horse, neither was elevation of temperature or other sign of illness noted in any horse. In a typical case of a horse inoculated subcutaneously, the St. Louis virus was isolated from the circulating blood twenty-six, thirty-six and forty-eight hours after inoculation, after which the blood became sterile. By the end of twenty-two days all inoculated animals had developed high titer antisera. The Hooper Institute bacteriologists believe that their subcutaneous test represents the essential features of the usual method of spread of this disease, a symptomless, "inapparent" or subclinical infection due to an insect carrier, an infective concentration of the virus being present in the blood stream during the first forty-eight hours, permitting infection of other blood sucking insect vectors. In none of their experiments did the mosquito borne virus manifest sufficient neurotropic tendencies to produce clinical symptoms of encephalitis, although it did produce typical encephalitis on intracerebral inoculation into mice.

If this work is adequately confirmed, it would seem reasonable to conclude that the wide dissemination of antibodies in wild and domestic animals of the Pacific Coast is due to an insect borne subneurotropic virus producing a subclinical septicemia. The insect borne virus would then function as a specific vaccine, immunizing the animal population against clinical types of the disease. Whether or not the St. Louis virus is modified in its virulence or specificity by insect passage has not yet been determined.

## Current Comment

### DISTURBANCE OF CARBOHYDRATE METABOLISM AS AN ETIOLOGIC FACTOR IN SCHIZOPHRENIA

Meduna and his associates<sup>1</sup> at Loyola University School of Medicine tested the assumption that one of the accompaniments of schizophrenia may be a disturbance of the carbohydrate metabolism acting antagonistically to the normal carbohydrate metabolism. Investigation of the diabetogenic action of the anterior lobe of the hypophysis has established that there is no change in the hormone concerned with carbohydrate metabolism of the blood serum of schizophrenic patients. In fasting schizophrenic patients the same hypophysial deficiency is apparent as in starving normal persons. The Tannhauser and Pfitzer test when applied to 20 schizophrenic patients indicated a disturbance in the carbohydrate metabolism characterized by a delayed utilization of blood sugar. This delay, the authors believe, is due to overactivity of some product of endocrine origin which inhibits the effect of insulin normally produced. The quantitative relation of this hypothetic substance to 35 Gm of dextrose injected is measured by the prolongation of the period of hyperglycemia. This time is fifteen minutes for normal persons, while for the schizophrenic it increases twofold to eightfold. Blood from normal subjects, when injected intraperitoneally into a rabbit in amounts of 20 cc, did not protect the animal against the effect of injected insulin. The blood sugar curve obtained from rabbits injected with blood from schizophrenic patients and with insulin was distinctly different. This curve differed from the average curve for rabbits which received blood from normal persons in two respects. 1. The greatest loss of blood sugar indicated by the average curve for animals receiving blood from schizophrenic subjects was 52.8 per cent, and that indicated by the curve for animals receiving blood from normal subjects was 67 per cent. 2. The recovery of the curve for animals which received blood from schizophrenic patients began at the second hour and proceeds continuously at an increasing rate. The recovery curve for animals which received blood from normal subjects is sluggish, the difference between the second and the third hour 1.08 per cent, between the third and fourth hour 4.1 per cent, and between the fourth and fifth hour 4.3 per cent, so that in the fifth hour the average loss is still 67 per cent as compared with the 25.6 per cent loss of blood sugar for the group which received blood from schizophrenic patients. The differences in the values for the schizophrenic group are as follows: between the second and third hour 4.9 per cent, between the third and fourth hour 9.5 per cent and between the fourth and fifth hour 12.8 per cent. These experiments seem to indicate that schizophrenic patients generally have more anti-insulin factor in their blood than

1 Meduna, L. J., Gerty, F. J., and Urse, V. G. I. Disturbances in Mental Disorders. I. Anti Insulin Effect of Blood of Schizophrenia. Arch. Neurol. & Psychiat. 17: 34 (July 1947).

normal persons. There appears to be a "characteristic schizophrenic curve." In cross experiments the authors have demonstrated that the same rabbit reacted in a characteristic manner to the injection of blood from a normal and to the injection of blood from a schizophrenic person. The presence of an anti-insulin factor in the blood of the schizophrenic was likewise demonstrated in experiments *in vitro*. The authors found that a schizophrenic pattern in about 60 per cent of their cases was characterized by the presence of the anti-insulin factor while a similar clinical pattern in about 40 per cent of the cases was not accompanied by the presence of an anti-insulin factor. The blood sugar curve of experimental animals might then be used as a diagnostic test for schizophrenia accompanied by the presence of an anti-insulin factor. The presence of this factor which acts antagonistically to normal carbohydrate metabolism may be one of the etiologic factors in schizophrenia. A subdivision of schizophrenia into two pathogenically different forms is thus made possible. Certainly these observations offer opportunity for a scientific approach to several unsolved problems in schizophrenia.

#### AVOIDANCE OF CONSTIPATION THROUGH DRINKING OF WATER

Constipation is a clinical term—loosely used—denoting a state of the bowels in which evacuations are infrequent and difficult or the volume of the stools is insufficient. Evacuation of feces is the function of the left half of the colon. A number of clinical, mechanical and reflex (gastrocolic) factors are recognized as contributing to its proper function. The amount of water ingested daily is probably not a factor of any great importance in the maintenance of this function. Consumed water is absorbed principally in the right half of the colon. Insufficient fluid intake would result in a drier fecal current to the left colon. However, the dry, hard stool of the patient with constipation is due to the long overtime which the feces spend in the colon rather than to insufficient fluid intake. A certain amount of water is of course essential for body needs. From clinical experience it would not be possible to state definitely that insufficient water intake is a factor in constipation, and still less that adequate or excessive amounts have any prophylactic or curative value.

Brown<sup>1</sup> stresses the fact that many people, especially women, will drink only 2 or 3 glasses of water a day. The water intake for a person who suffers from constipation he believes should be about 2 liters. Adson and Barger<sup>2</sup> advise between 2.5 and 3 liters of liquids daily. A search of the literature for experimental studies on the subject reveals a cursory reference by Bastedo<sup>3</sup> in which it is told that a number of "non-digestive" patients were made to drink 1 glass of water every hour for fifteen hours daily (almost a gallon) for one week. This regimen did not increase the bowel

movements and served merely to activate the kidneys. The majority of clinicians recommend from 8 to 10 glasses of water a day for persons with constipation. Laxative amounts may be helpful in some cases. The available data do not justify the opinion that excessive amounts of ingested water may be considered a factor in avoiding constipation. The mode of living, habits, diet and emotional responses are probably the determining factors in the causation of constipation.

#### U S FINDS "FINGER SURGEON" FRAUD IN INCOME TAX

Curtis H. Muncie, a somewhat glorified osteopath who has in the past received much publicity for his deafness "cure," including some items in *THE JOURNAL*, has pleaded guilty to five counts charging income tax fraud. The maximum penalty for each count is five years in prison and \$10,000 fine. Actually he is said to have evaded, from 1932 to 1936, \$159,280 in taxes in connection with a reported income during that period of \$502,681. This information appears in an item in the *New York Times* for June 16, 1942. Muncie's first extensive publicity was obtained because of a trip to Europe supposedly for the purpose of curing a congenital deafness of the second son of the king of Spain. On returning to this country Muncie denied that he had treated this individual, Prince Don Jaime, and declared that he had undertaken the trip to Europe for the purpose of treating another prince and that he had done so successfully. The attention of the public was called to this matter in 1926 in an article in *Hygeia*.<sup>1</sup> Investigation at that time proved that Prince Don Jaime was still deaf and had undergone no such treatment. Previously in the *Journal of the American Osteopathic Association*, Muncie had claimed 100 per cent success in the prevention of deafness and permanent improvement in 100 per cent and cures in 95 per cent of what he called first degree catarrhal deafness. In second degree catarrhal deafness he claimed improvement in 95 per cent and cures in 80 per cent. Muncie referred to his procedure as "operative constructive finger surgery," which he administered under anesthesia and claimed that the patient "comes back from a pleasant sleep with a reconstructed nasal and nasopharyngeal area." According to the *Hygeia* article, the examination charge was \$25 and the operation itself \$200 and up, with postoperative treatments, two a week for six months, at \$10 each. Previously *THE JOURNAL* had called the attention<sup>2</sup> of the medical profession to this alleged miracle man and noted that both osteopaths and chiropractors had claimed him. If the report of Muncie's income in the *New York Times* is accurate and represents returns from his practice, Muncie may well rank among the leading charlatans of our time—Abrams, Baker, Brinkley and Locke. Law making agencies which have clamped down on the promotion of "patent medicines" that are harmful to the public might at the same time find ways to reach the exploiters of pseudomedicine and bizarre techniques.

<sup>3</sup> Bastedo, W. E. Chronic Constipation. *M. Clin. North America* 20: 891 (Nov.) 1936.

<sup>1</sup> Crump, Arthur J. Deafness Cure Quackery and Pseudo Medicine. *Hygeia* 4: 21 (Jan.) 1926.

<sup>2</sup> Cunningham, Prince Don Jaime's Deafness Again. *Current Comment J. A. M. A.* 81: 481 (Aug. 11) 1925.

# MEDICINE AND THE WAR

*In this section of The Journal each week will appear official notices by the Committee on Medical Preparedness of the American Medical Association, announcements by the Surgeon Generals of the Army, Navy and Public Health Service, and other governmental agencies dealing with medicine and the war, and such other information and announcements as will be useful to the medical profession*

## PROCUREMENT AND ASSIGNMENT SERVICE FOR PHYSICIANS, DENTISTS AND VETERINARIANS

### RESTATEMENT OF DUTIES OF THE VARIOUS UNITS OF THE PROCUREMENT AND ASSIGNMENT SERVICE

The development of the Procurement and Assignment Service program makes a reappraisal of the duties of the units seem desirable at this time

#### DIRECTING BOARD

1 Establishment of policies and procedures for the Procurement and Assignment Service

2 Maintenance of liaison with the appropriate governmental officials and agencies and with the various professional groups

#### CENTRAL OFFICE

1 Maintenance of contacts with federal agencies relative to their needs for physicians, dentists and veterinarians, and consultations with these agencies regarding the possibilities of revision of their requests in consideration of the limited supply of professional men in these fields

2 Preparation of quotas of the minimum medical, dental and veterinarian services which should be retained for the civilian population, including private practice, hospital service, industrial service, public health service and medical education

3 Preparation of quotas for allocating to the states the requests for physicians, dentists and veterinarians needed for war service, these quotas to be determined on the basis of the physician-population ratio in the state, the number of physicians already in service from that state, and so on

4 Maintenance of rosters of physicians, dentists and veterinarians (a) total in the United States, (b) those who have registered with the Procurement and Assignment Service, (c) these rosters to contain physician's age, qualifications, location and the like. From these rosters, which will be maintained by the National Roster, names of physicians, dentists and veterinarians with certain qualifications will be obtained from time to time

5 Secure information for the various governmental agencies in regard to physicians, dentists and veterinarians, as to (a) availability for service other than in their present location, (b) their professional and other qualifications, (c) their willingness to serve in various capacities during the war emergency

6 On the basis of this information, select the names of those physicians who meet the specifications of the requisitioning agency

7 Cooperate with the various governmental agencies in obtaining the applications of those physicians thus selected for service

#### CHICAGO OFFICE

1 Maintain and keep up to date the confidential information concerning all physicians, dentists and veterinarians with respect to character, type of practice, infringements of law and so on, which must be considered by the Army, Navy or other service in deciding whether individuals are qualified for commission

2 Maintain confidential lists of the relative standing of all specialists. These lists have been developed through the facilities of the American Medical Association, the American Specialty Boards, the National Research Council and confidential

advisers representative of the various specialties. This material is to be used by the requisitioning agencies as a basis for assignment of those now on duty and those who are candidates for commission

3 Assistance of a consultative and advisory nature to the directing board and to the various committees of the Procurement and Assignment Service. This includes the utilization of statistical data collected over a period of many years by the medical, dental and veterinary medical associations

#### CORPS AREA COMMITTEES

1 To supervise the work of the state committees in order that they may be reasonably uniform in the manner in which they carry out the policies of the directing board. This will require meetings of the corps area committees with state chairmen and visits by the corps area chairman to the states within his corps area

2 To act as appeal board in cases in which the individual physician, dentist or veterinarian, his community or his employing agency differs with the classification given by the state procurement and assignment committee

#### STATE COMMITTEES

1 To obtain the overall enrolment of the professions in the state. This will require the maintenance of rosters in the state offices of those who have enrolled with the Procurement and Assignment Service and those who have not. The former lists will be obtained from the central office

2 Survey local needs for professional services in conformity with the policies laid down by the directing board. On the basis of these surveys determine how many physicians, dentists or veterinarians are needed in the various communities of the states to care for the civilian needs and how many can be released for service elsewhere

3 Determine which particular individual physicians, dentists or veterinarians can be considered "available" for service elsewhere. In view of the changing circumstances this will require constant reappraisal and obviously can be done only locally

4 Pass on the availability, character and professional qualifications of individual physicians who are being considered for appointment for service elsewhere, e.g. for commission in the Army or Navy

5 Cooperate with the state offices of the Selective Training System in determining whether physicians, dentists and veterinarians who are subject to classification by Schedule D are essential in their local communities

6 Maintenance of lists to be transmitted from the central office of those who have expressed their preference for service in industrial practice, civil practice in other communities and local health departments and institutions. Maintain liaison between these individuals and the industrial corporations, civil practitioners, health departments and institutions desiring the services of these individuals in a temporary capacity for the duration of the war

7 Keeping the directing board informed of conditions in the state and bringing to the attention of it matters which may involve general policies

8 Periodic (weekly) reports to the central office of the names and addresses of those commissioned from the state with information as to which of these have been serving as interns or residents

#### DISTRICT OR COUNTY COMMITTEES

1 To provide information assistance and advice to the state committees in carrying out their functions. Local committees have no authority to make final decisions as to whether positions or individuals are essential or nonessential

By Order of the Directing Board

SAM F SEELY, M.D., Executive Officer

## OPPOSITION TO SEGREGATION OF BLOODS FROM WHITE AND NEGRO DONORS IN BLOOD BANKS

The Committee on Race Relations of the American Association of Physical Anthropologists, which includes

- DR WILLIAM K CREGORY, curator, Department of Comparative Anatomy, American Museum of Natural History and president of the American Association of Physical Anthropologists
- DR HARRY L SHAPIRO, assistant curator, Department of Physical Anthropology, American Museum of Natural History
- DR FRANZ WEINREICH, formerly of Peking Union Medical School, Peiping, China, and now working at the American Museum of Natural History
- DR W W CRELLICH, professor of physical anthropology and anatomy, Western Reserve University Medical School and director of the Brush Foundation, Chairman

is opposed to the segregation of the bloods from white and Negro donors in the blood banks which are being collected under the auspices of the American Red Cross. The committee's reasons for opposing it are the following:

1 There is no evidence that the blood of Negroes differs in any significant respect from that of white persons. The successful transfusion with whole blood from white persons to Negroes or vice versa can be accomplished quite as readily as between members of the same race. The same blood groups occur among both white persons and Negroes and no difference has been demonstrated between white and Negro bloods of the same groups.

In the form of dried serum or plasma in which the blood currently collected is being stored, even differences in blood group between donor and recipient are of no consequence.

2 One objection to the indiscriminate use of Negro blood in the blood bank is the somewhat higher incidence of syphilis among Negroes and the erroneous notion that the disease can be transmitted by means of dried blood of a syphilitic donor to a nonsyphilitic recipient.

(a) Every blood sample received is tested for evidence of syphilis and all samples found to react positively are rejected.

(b) Procedures used in preparing and preserving the dried blood plasma or serum would kill any syphilitic organism in the

blood even if as might conceivably happen the blood of a syphilitic donor was inadvertently included in the blood bank.

3 The segregation of the blood of white persons from the blood of Negroes in the blood bank is therefore not only unscientific but is a grievous affront to the largest minority group in our country. This policy of the American Red Cross appears even more indefensible when one considers the origins of some of the substances which are widely and effectively used in modern medical practice and which are readily accepted by the patient.

(a) The use of materials obtained from the blood of horses, rabbits and other animals for protecting against or combating various diseases, such as diphtheria and pneumonia.

(b) Many of the estrogenic (female sex hormone) and gonadotropic preparations currently used in therapy are obtained from the urine of stallions and from the urine or blood serum of pregnant mares. Their efficacy is in no way impaired by their rather inauspicious origin.

(c) The use of extracts or concentrates of various animal organs in the treatment of certain human diseases has been accepted gratefully and with much benefit by those afflicted with such diseases as pernicious anemia, hypothyroidism, diabetes mellitus and Addison's disease.

In view of these facts it seems highly improbable that any soldier or civilian so seriously wounded as to require a blood or plasma transfusion will insist that it come from a donor whose skin is no darker than his own.

It is interesting in this connection to recall that the practice of using colored women as wetnurses was at least formerly quite widespread among the better circumstanced families in the Southern part of this country. It is quite certain that along with the nutritious elements in the milk of those colored women, the white infants ingested many of the same substances which were circulating in the blood stream of the women who suckled them. It is most unlikely that it did them any harm.

## SOLDIERS MARCH TO SAVE GASOLINE

In the transfer from Camp Lee to Camp Pickett of thousands of medical department soldiers comprising the Medical Replacement Center, the three day movement was made on foot rather than by trucks, according to the *New York Times*, primarily to conserve tires and gasoline, of which it is estimated 300,000 tire miles and 5000 gallons of gasoline were saved. Although authorized to transfer the troops by trucks, Brig Gen William R. Dear, M.C., commanding the Medical Replacement Center, used the opportunity to provide the troops with experience in camp and other phases of field training. The center is now at Camp Pickett in what was described as one of the newest and most modern camps in the country.

## FLIGHT SURGEONS' ASSISTANTS

Six courses for flight surgeons' assistants are conducted annually at the School of Aviation Medicine, Randolph Field, Texas. These men are trained as specialists and assistants to flight surgeons in the selection, care and maintenance of the flier. A class of six-three flight surgeons' assistants completed the six weeks course on June 16. Colonel Eugen G. Reinartz, M.C., U.S. Army, commandant of the school, addressed the class, and the certificates were presented by Major Merrill J. Reeh, M.C.

## INSTRUCTION IN MEDICAL ASPECTS OF CHEMICAL WARFARE

A program is being established to instruct thousands of physicians in New York to diagnose and treat persons suffering from poison gas in case of gas attacks by the enemy. Dr. David D. Rutstein, who has been appointed consultant on the medical aspects of chemical warfare for the medical division for the Office of Civilian Defense, will initiate the program. Dr. Rutstein, who is on leave as chief of the cardiac bureau of the New York State Health Department, completed the course in chemical warfare given at the University of Cincinnati (*THE JOURNAL*, June 27, p. 717) under the sponsorship of the office of Civilian Defense. In April a course was completed also by two faculty members from each of the medical schools in New York, and classes which include the chiefs of local emergency medical service squads throughout New York are now being organized.

The classes at the medical schools, which will be given to about two hundred and forty-five physicians, will comprise a total of six hours instruction. The next phase of the program will be the instruction of four thousand members of emergency medical service squads, then similar instruction will be given to the remaining practicing physicians in the state. It is expected that at least the first aid aspects of the treatment of cases of

gas poisoning will filter on down to the air raid wardens and the auxiliary firemen and policemen

As soon as this program has been set up in New York, Dr Rutstein will establish similar programs of instruction for all physicians on the eastern seaboard and along the gulf coast

### BUNDLES FOR BRITAIN

At a national meeting of Bundles for Britain, Inc., in New York on June 10 the financial statement presented showed a total of \$6,546,153 received between its foundation on Dec 7, 1939 and May 29, 1942. This total included cash received, venues from entertainments and profits from the sale of merchandise donated and from contributed articles. Of this total \$802,696, or 12 per cent, was spent for administrative purposes, benefits, collections, warehousing, promotion, shipping and publicity.

Steps were taken to create an emergency fund by regular contributions from all branches, to be used to answer without delay the frequent cable requests from London for immediate relief funds.

The president of Bundles for Britain, Inc., is Mrs Robert W Bingham, the vice presidents are Mrs Charles Dana Gibson, Mrs Andrew Carnegie, Mrs Eliot Tuckerman and Colonel William Chadbourne, the secretary is Mrs R Alger Sawyer. On the advisory committee are Mrs Marshall Field, Mrs A I du Pont and Alfred E Smith. After the meeting the delegates inspected the warehouses and workrooms and in the evening attended a dinner meeting which was addressed, among others, by the wife of the British ambassador, Viscountess Halifax, and Sir Gerald Campbell, the British minister.

### CIVILIAN DEFENSE

Dr Fred W Rankin, Lexington, Ky., president of the American Medical Association, has retired as a member of the advisory board of the Office of Civilian Defense on being called to active duty in the Surgeon General's Office of the Army and has been succeeded on that board by Dr John T O'Rourke, dean of the University of Louisville School of Dentistry.

Dr Victor H Vogel, passed assistant surgeon of the U S Public Health Service, has joined the staff of the Medical Division of the Office of Civilian Defense. Dr Vogel has been with the U S Public Health Service since 1931 and has served with the Division of Mental Hygiene since 1935.

Dr Dean A Clark, surgeon, U S Public Health Service, reserve, New York City, has been appointed head of a hospital section organized in the Medical Division of the Office of Civilian Defense, and head of a new emergency medical section in the U S Public Health Service, which will administer the program jointly with the Medical Division of the Office of Civilian Defense. Since 1939 Dr Clark has been on the staff of the Division of Public Health Methods, National Institute of Health, of the U S Public Health Service.

Mr Carl E Schwob of Chicago has been appointed sanitary engineer, U S Public Health Service, reserve, and assigned to the Office of Civilian Defense. Mr Schwob graduated in civil engineering from the State University of Iowa and took a master of science degree in sanitary engineering at Harvard Graduate School of Engineering. He was on the staff of the Illinois State Department of Health from 1926 to 1937 and from 1938 to 1941. In 1939 he was lent by the state health department to the State Department of Welfare of Illinois as assistant managing officer at the Manteno State Hospital in charge of typhoid control during and following a serious epidemic at that hospital.

The first showing of the sound slide film on the operation of the Emergency Medical Service of the Office of Civilian Defense was made at the annual meeting of the American Medical Association at Atlantic City, June 8-12 (THE JOURNAL, June 13, p 569).

Dr E Howe Miller has been appointed director of the medical detachment in the civilian defense program of Danville, Va.

Mr H N Hooper, superintendent of the Cincinnati General Hospital, has been granted a leave of absence for the duration of the war to accept a position as hospital administrator in the Office of Civilian Defense.

Dr Gilbert S Osingcup, Orlando, Fla., who has been commissioned in the U S Public Health Service, reserve, has been visiting defense councils in Florida in connection with the Office of Civilian Defense.

Dr Sylvester D Craig, Winston-Salem, has been named director of the North Carolina emergency medical service.

### FIRST AID TRAINING IN GARY STEEL MILLS

At the mills of the Carnegie-Illinois Steel Corporation in Gary, Ind., a round the clock program of first aid training has been set up which already has been completed by nearly seven hundred employees who have taken the twenty-hour standard Red Cross course in first aid. The schedule for the classes at these mills is arranged so that employees of all three shifts may participate. The classes are conducted by twenty instructors who have Red Cross first aid certificates and are under the direction of Dr D E Griffiths, chief medical officer of the emergency defense organization of this plant. One of the instructors was sent to Texas to receive special training in combating the effects of chemical and demolition bombs. The pupils who make the best records in the first aid courses are selected for the stretcher teams, each being assigned to a definite station in the plant in case of emergency and each team composed of a captain and eight assistants. Others who have completed the course will be stationed in case of emergency at the four first aid and two dressing stations in the plant. Among those who have already completed their first aid course are one hundred ten girls, some of whom are expected to continue further training to qualify as nurses' assistants.

### COMMITTEE ON BACTERIOLOGY

The Society of American Bacteriologists has appointed a war committee on bacteriology with Dr Thomas M Rivers, New York, as chairman, other members are Robert E Buchanan, Ph D, Ames, Iowa, Edwin J Cameron, Ph D, Washington, D C, Edwin B Fred, Ph D, Madison, Wis, and Dr N Paul Hudson, Columbus, Ohio, Selman A Waksman, Ph D, New Brunswick, N J, president of the society, and William B Sarles, Ph D, Madison, Wis, secretary-treasurer, are ex officio members. The committee aims to serve as a clearing house for research in the fields of medical, industrial and agricultural bacteriology and general microbiology, to coordinate the activities of various interested groups and to act in an advisory capacity to them. It will aid in the placement of bacteriologists with positions concerned with defense.

### CORNELL HOSPITAL UNIT CALLED TO ACTIVE DUTY

The New York Hospital and Cornell Medical College Hospital unit has been called to active military service. At the 171st charter day meeting of the Society of the New York Hospital, June 18, the acting president, Langdon P Marvin read a message from President Roosevelt, whose great great grandfather Isaac Roosevelt was one of the founders. Among the speakers at the charter day meeting was Major General Frank R McCoy, U S Army retired, president of the Foreign Physicians Association.

### BLOOD BANKS IN WEST VIRGINIA

Since the U S Public Health Service will not make immediately available to establish blood banks in cities more than 300 miles from the coast line, which excludes Huntington and Charleston, the three West Virginia commissioners, Dr Clifton F McClintic announced a plan to establish blood banks on "a voluntary basis" in the state to the Charleston Mail of May 15.

# ORGANIZATION SECTION

## PROCEEDINGS OF THE ATLANTIC CITY SESSION

MINUTES OF THE NINETY THIRD ANNUAL SESSION OF THE AMERICAN MEDICAL ASSOCIATION, HELD IN ATLANTIC CITY, JUNE 8-12, 1942

### MINUTES OF THE SECTIONS

#### SECTION ON PRACTICE OF MEDICINE

WEDNESDAY, JUNE 10—AFTERNOON

The meeting was called to order at 2:15 by the chairman, Dr. Roy W. Scott, Cleveland.

Drs. Elmer P. Ralli and Saul H. Rubin, New York, presented a paper on 'The Effect of Heat and Heat Frictions on the Fatty Liver of Depreciated and Pancreatic Duct Ligated Dogs.' Discussed by Dr. M. Lawrence Montgomery, San Francisco.

Drs. James A. Greene and G. F. Keohon, Iowa City, presented a paper on 'Insulin Resistance Due to Infection in Diabetes Mellitus in Man.' Discussed by Dr. Howard F. Root, Boston.

Dr. Joseph H. Pratt, Boston, read the Frank Billings Lecture on 'Advances in the Diagnosis and Treatment of Pancreatic Disease.' Dr. Pratt was introduced by the chairman, who gave a brief historical review of the Frank Billings Lecture.

Drs. Joseph T. Beardwood Jr. and George P. Rouse Jr., Philadelphia, presented a paper on 'Effects of Estrogenic Substances in the Treatment of Diabetes.' Discussed by Drs. Herman O. Mosenthal, New York, Charles W. Dunn, Philadelphia, Howard F. Root, Boston, and Carlos A. P. Lamar, Miami, Fla.

Dr. Russell S. Boles, Philadelphia, read a paper entitled 'Observations on the Prevention and Management of Peptic Ulcer.' Discussed by Drs. Sara M. Jordan, Boston, Frank H. Lahey, Boston, and Hyman I. Goldstein, Camden, N. J.

THURSDAY, JUNE 11—AFTERNOON

The following officers were elected: chairman, Dr. Burrell Raulston, Los Angeles; vice chairman, Dr. Charles Wolferth, Philadelphia; secretary, Dr. William D. Stroud, Philadelphia; delegate, Dr. Fred M. Smith, Iowa City; alternate, Dr. Roy W. Scott, Cleveland; executive committee, Dr. Fred M. Smith, Iowa City; Dr. Roy W. Scott, Cleveland; and Dr. Burrell Raulston, Los Angeles, member of the American Board of Internal Medicine; Dr. John Musser, New Orleans.

Drs. Harrison F. Flippin, Leon Schwartz and Albert H. Domm, Philadelphia, presented a paper on 'Modern Treatment of Pneumococcal Pneumonia.' Discussed by Drs. Adolph S. Rumreich, Chicago, and Worth B. Daniels, Fort Bragg, N. C.

Dr. Roy W. Scott, Cleveland, read the chairman's address entitled 'Arterial Hypertension.'

Drs. W. D. Sutcliffe, Milton, Helpner and Gerard P. J. Griffin, New York, presented a paper on 'Sulfonamide Toxicity as a Cause of Death in New York City in 1941.' Discussed by Drs. Perrin H. Long, Baltimore, and Russell L. Cecil, New York.

Dr. Edward Weiss, Philadelphia, read a paper on 'Psychosomatic Aspects of Hypertension.' Discussed by Dr. Roy W. Scott, Cleveland.

Drs. Frank S. Dolley and Lyman A. Brewer, Los Angeles, presented a paper on 'Intrathoracic Tumors: Diagnosis and Treatment.' Discussed by Dr. Roy W. Scott, Cleveland.

FRIDAY, JUNE 12—MORNING

A joint meeting was held with the Section on Experimental Medicine and Therapeutics. The proceedings are reported in the minutes of that section.

#### SECTION ON SURGERY, GENERAL AND ABDOMINAL

WEDNESDAY, JUNE 10—MORNING

The meeting was called to order at 9 o'clock by the chairman, Dr. Arthur W. Allen, Boston.

Dr. Edgar J. Poth, Baltimore, read a paper on 'Succinyl Sulfathiazole as an Adjuvant in Surgery of the Large Bowel.' Discussed by Drs. John S. Lockwood, Wynnewood, Pa., H. C. Saltzstein, Detroit, and Edgar J. Poth, Baltimore.

Dr. Frank H. Lahey, Boston, read a paper on 'Lesions of the Right Colon Involving Right Colectomy.'

Dr. Harvey S. Stone and Dr. Samuel McLanahan, Baltimore, presented a paper on 'Resection and Immediate Anastomosis for Carcinoma of the Colon.'

These two papers were discussed by Drs. C. W. Mayo, Rochester, Minn., Henry W. Cave, New York, Arthur W. Allen, Boston, Frank H. Lahey, Boston, and Harvey B. Stone, Baltimore.

Dr. Thomas E. Jones, Cleveland, read a paper on 'Complications of the Combined Abdominoperineal Operation Based on Over Five Hundred Cases.' Discussed by Drs. Frederick A. Collier, Ann Arbor, Mich., E. Parker Hayden, Boston, and Garnet W. Ault, Washington, D. C.

Dr. Charles B. Puestow, Chicago, read a paper on 'Experimental and Clinical Studies of Intestinal Motility and Post-operative Distention.' Discussed by Dr. Robert J. Crawley, Detroit.

Dr. I. S. Ravdin, Philadelphia, read a paper on 'The Prevention of Liver Damage and the Facilitation of Repair in the Liver by Diet.' Discussed by Dr. Walter E. Lee, Philadelphia.

THURSDAY, JUNE 11—MORNING

Dr. J. Ross Veal, Washington, D. C., read a paper on 'The Prevention of Pulmonary Complications Following Thigh Amputations by High Ligation of the Femoral Vein.'

Dr. W. J. Potts, Oak Park, Ill., read a paper on 'Pulmonary Embolism: A Clinical and Experimental Study.'

These two papers were discussed by Drs. Geza de Takats, Chicago, Edgar V. Allen, Rochester, Minn., L. W. Grossman, New York, J. Ross Veal, Washington, D. C., and W. J. Potts, Oak Park, Ill.

Dr. Arthur W. Allen, Boston, read the chairman's address, entitled 'Subtotal Gastrectomy for Stenosing Duodenal Ulcer.'

Drs. Harry E. Mock and Harry E. Mock Jr., Chicago, presented a paper on 'Management of Skull Fractures and Brain Injuries.' Discussed by Drs. Max M. Pect, Ann Arbor, Mich., Fred M. Douglass, Toledo, Ohio, A. S. Leven, Chicago, F. M. Summerville, Oil City, Pa., and Harry E. Mock, Chicago.

Dr. J. D. Martin Jr., Atlanta, Ga., read a paper on 'Pulsating Exophthalmos.' Discussed by Drs. Harry H. Kerr, Washington, D. C., Alton Ochsner, New Orleans, and James Rudolph Jaeger, Denver.

Drs. George M. Curtis and James D. King, Columbus, Ohio, presented a paper on 'Blast Injuries to the Lungs.' Discussed by Drs. Casper F. Hegner, Denver, and George M. Curtis, Columbus, Ohio.

Dr. Harold L. Foss, Danville, Pa., read a paper on 'Total Hysterectomy: A Consideration of a New Operative Technique.' Discussed by Drs. V. S. Counsellor, Rochester, Minn., and Conrad G. Collins, New Orleans.

## FRIDAY, JUNE 12—MORNING

The following officers were elected chairman, Dr Frederick A Collier, Ann Arbor, Mich, vice chairman, Dr Lester R Dragstedt, Chicago, secretary, Dr Alton Ochsner, New Orleans, delegate, Dr Henry W Cave, New York, alternate, Dr Grover C Penberthy, Detroit, executive committee Dr Lloyd Noland, Fairfield Ala, Dr Arthur W Allen, Boston, and Dr Frederick Collier, Ann Arbor, Mich, member of board of governors, American College of Surgeons, Dr Owen H Wangersteen, Minneapolis, representative to the Scientific Exhibit, Dr Grover C Penberthy, Detroit

A motion was made by Dr J B Haskins, Chattanooga, Tenn, seconded by Dr E Payne Palmer, Phoenix, Ariz, and carried, authorizing appointment of a committee to represent the section on the Council on Industrial Health. The chairman, in compliance with the action taken, appointed Drs Lloyd Noland, Fairfield, Ala, chairman, William L Estes Jr, Bethlehem, Pa, Henry Chase Marble, Boston, Thomas M Joyce, Portland, Ore, and S Perry Rogers, Chicago

Dr U V Portmann, Cleveland, read a paper on "Classification of Primary Cases of Cancer of the Breast"

Dr Frank E Adair, New York, read a paper on "The Role of Surgery and Radiation in Cancer of the Breast"

These two papers were discussed by Drs Shields Warren, Boston, C D Haagensen, New York, William C White, New York, E Payne Palmer, Phoenix, Ariz, U V Portmann, Cleveland, and Frank E Adair, New York

Dr Robert Elman, St Louis, read a paper on "Acute Protein Deficiency in Shock, Burns, Intestinal Obstruction and Peritonitis" Discussed by Drs Alexander Bunschwig, Chicago, H N Harkins, Detroit, and Robert Elman, St Louis

Drs Elliott C Cutler and Robert Zollinger, Boston, presented a paper on "Acute Cholecystitis" Discussed by Drs Frank Glenn, New York, Henry F Graham, Brooklyn, D Woolfolk Barrow, Lexington, Ky, Moses Behrend, Philadelphia, and Elliott C Cutler, Boston

Drs F W Gaarde, L E Prickman and H J Raszkowski, Rochester, Minn, presented a paper entitled "Is the Asthmatic Patient a Good Surgical Risk?" Discussed by Drs L N Gay, Baltimore, Geza de Takats, Chicago, and L E Prickman, Rochester, Minn

Dr William Bates, Philadelphia, read a paper on "Intraspinal Administration of Ammonium Sulfate" Discussed by Dr Jacob Goeller, Livingston, N J

## SECTION ON OBSTETRICS AND GYNECOLOGY

## WEDNESDAY, JUNE 10—AFTERNOON

The meeting was called to order at 2 o'clock by the chairman, Dr Walter T Dannreuther, New York

Drs A R Abarbanel, Baltimore, and Harry Aranow, New York, presented a paper on "Clinical Evaluation of Stilbestrol in Gynecology and Obstetrics" Discussed by Drs Emil Novak, Baltimore, Robert B Greenblatt, Augusta, Ga, Joseph A Hepp, Pittsburgh, Carlos A P Lamar, Miami, Fla, Karl John Karnaky, Houston, Texas, John M Freiheit, Waterbury, Conn, and A R Abarbanel, Baltimore

Dr Robert B Greenblatt, Augusta, Ga, read a paper on "Implantation of Testosterone Propionate Pellets in Gynecic Disorders" Discussed by Drs Willard M Allen, St Louis, Udall J Salmon, New York, L F Hawkinson, Oakland, Calif, Charles F Geschickter, Baltimore, Carlos A P Lamar, Miami, Fla, and Robert B Greenblatt, Augusta, Ga

Dr Alejandro Lipschutz, Santiago, Chile, read a paper on "Experimental Fibroids and the Antifibromatogenic Action of Steroid Hormones"

Dr H W Mayes, Brooklyn, read a paper on "Vaginal Antisepsis During Labor: Ten Thousand Vaginal Deliveries Without a Death from Puerperal Infection" Discussed by Drs Paul Titus, Pittsburgh, Robert Gordon Douglas, New York, and H W Mayes, Brooklyn

Dr Charles E McLennan, Minneapolis, read a paper on "Conservative Treatment of Inversion of the Uterus" Discussed by Drs W Benson Harer, Philadelphia, W A Coventry, Duluth, Minn, Louis E Phaneuf, Boston, John Huberman, Newark, N J, and Charles E McLennan, Minneapolis

Drs J Milton Singleton and Herbert F Vanorden, Kansas City, Mo, presented a paper on "Vaginal Tampons in Menstrual Hygiene" Discussed by Drs George Gray Ward, New York, Marie P Warner, New York, Robert L Dickinson, New York, and J Milton Singleton, Kansas City, Mo

## THURSDAY, JUNE 11—AFTERNOON

The following officers were elected chairman, Dr Louis E Phaneuf, Boston, vice chairman, Dr Wendell M Long, Oklahoma City, secretary, Dr Philip F Williams, Philadelphia, executive committee Dr Norman F Miller, Ann Arbor, Mich, Dr Walter T Dannreuther, New York, and Dr Louis E Phaneuf, Boston, governors, American College of Surgeons, Dr Emil Novak, Baltimore, Dr Thomas K Brown, St Louis, and Dr Alice Maxwell, San Francisco, delegate, Dr J P Pratt, Detroit, alternate, Dr Harvey B Matthews, Brooklyn, representatives to American Committee on Maternal Welfare, Dr G C Schauffler, Portland, Ore, Dr E D Plass, Iowa City, and Dr R D Mussey, Rochester, Minn, representatives to the American Board of Obstetrics and Gynecology, Dr Francis Bayard Carter, Durham, N C, Dr Louis E Phaneuf, Boston, and Dr Ludwig A Emge, San Francisco

A resolution was passed authorizing appointment of a Committee on Health of Women in Industry in the Section on Obstetrics and Gynecology of the American Medical Association, to cooperate with the Council on Industrial Medicine. A motion was made and passed that the chairman of the Section on Obstetrics and Gynecology should appoint a five man committee for this purpose

Dr Alvin J B Tillman, New York, read a paper on "Classification and Medical Relationships of Hypertensive-Albuminuric Pregnancy"

Dr Howard C Taylor Jr, New York, read a paper on "Endocrinologic Physiology of Hypertensive-Albuminuric Pregnancy"

Dr William J Dieckmann, Chicago, read a paper on "Etiology, Prophylaxis and Treatment of Hypertensive-Albuminuric Pregnancy"

These three papers were discussed by Drs W W Herrick, New York, J Isfred Hofbauer, Cincinnati, A J Rongy, New York, and William J Dieckmann, Chicago

Dr Walter T Dannreuther, New York, read the chairman's address, entitled "Educational Objectives of the American Board of Obstetrics and Gynecology"

## FRIDAY, JUNE 12—MORNING

A joint meeting was held with the Section on Radiology. The proceedings are reported in the minutes of that section

## SECTION ON OPHTHALMOLOGY

## WEDNESDAY, JUNE 10—MORNING

The meeting was called to order at 9:15 by the chairman, Dr Lawrence T Post, St Louis

Dr Lawrence T Post, St Louis, read the chairman's address, entitled "Lifelong Care of the Eyes"

Dr Moacyr E Alvaro, São Paulo, Brazil, read a paper, "The Effects, Other Than Anti-Infectious, of the Sulfonamides on the Eye"

The following papers were read as a symposium, "Geriatrics"

Dr John H Morrissey, New York, "Urologic Geriatrics"

Dr George M Piersol, Philadelphia, "Medical Geriatrics"

Dr Henry W Woltman, Rochester, Minn, "Neurologic Geriatrics"

Dr Conrad Berens, New York, "Ophthalmic Geriatrics"

WEDNESDAY, JUNE 10—EVENING

*Executive Session*

A special executive session was held for the purpose of discussing the matter of optometric relations.

It was voted on motion made by Dr Parker Heath, Detroit seconded by Dr Charles A Bahn New Orleans that the section instruct its delegate to advise the House of Delegates of the American Medical Association that it wished to rescind the resolution of 1941.

THURSDAY, JUNE 11—MORNING

Dr T L Terry Boston read a paper on "Fibroblastic Overgrowth of Persistent Tunica Vasculosa Lentis in Infants Born Prematurely." Discussed by Drs Parker Heath Detroit, Samuel Gifford Chicago, Herman Goldberg Baltimore and T L Terry Boston.

Dr Walter B Lancaster Hanover N H read a paper on "The Nature Scope and Significance of Aniseikonia." Discussed by Dr Ernest A W Sheppard, Washington D C, Eric Liljencrantz, Washington D C, Robert H Peckham Pensacola Fla, and Walter B Lancaster Hanover N H.

Drs Cecil S O'Brien and J H Allen Iowa City, presented a paper on "Ocular Changes in Young Diabetic Patients." Discussed by Drs Glen G Gibson Philadelphia, and J H Allen Iowa City.

Dr Fred H Verhoeff Boston read a paper on "A Simple Quantitative Test for Acuity and Reliability of Binocular Stereopsis." Discussed by Drs Maynard C Wheeler New York, John B Hitz Milwaukee, K W Ascher Cincinnati, Walter B Lancaster Hanover N H, Morris Davidson New York, Robert H Peckham Pensacola, Fla and Fred H Verhoeff Boston.

Dr Jacob Goldsmith New York read a paper on "Experimental Studies on the Dynamics of the Intracapsular Cataract Extraction Suspensory Ligament and Hannover's Canal." Discussed by Drs Manuel U Troncoso New York, Henry J Minsky New York, Fred H Verhoeff Boston, and Jacob Goldsmith, New York.

*Executive Session*

On motion made by Dr Albert C Snell, Rochester N Y, and seconded by Dr H E Glock Fort Wayne Ind, it was voted unanimously that the delegate representing the section not be deprived of the privilege to vote in the House of Delegates.

*Scientific Session*

Drs Joseph Tiffin Lafayette Ind, and Hedwig S Kuhn Hammond, Ind presented a paper on "Color Discrimination in Industry." Discussed by Drs Alfred Cowan, Philadelphia, Peter C Kornfeld Chicago and Joseph Tiffin Lafayette, Ind.

*Demonstration Session*

Dr David F Gillette, Syracuse, N Y demonstrated a new eye shield.

FRIDAY, JUNE 12—MORNING

*Demonstration Session*

Dr Edward Stieren, Pittsburgh demonstrated a protective goggle for industry.

*Executive Session*

Dr Derrick Vail Cincinnati read the report of the Committee on Visual Economics.

Dr Derrick Vail Cincinnati read the report of the Committee on Awarding the Knapp Medal.

Dr Conrad Berens New York read the report of the American Board of Ophthalmology.

Dr Derrick Vail Cincinnati, read the report on the Registry of Ophthalmic Pathology.

Dr Derrick Vail, Cincinnati, read the report of the Committee on Scientific Exhibit.

Dr Derrick Vail Cincinnati read the report of the Committee on the Museum of Ophthalmic History.

Dr George Gunbor, Ottawa Ill, read the report of the Committee on Orthoptics.

Dr William L Benedict Rochester, Minn read the report of the Advisory Committee to the Eye Health Committee of the American Student Health Association.

Dr Derrick Vail Cincinnati, read the report of the Committee on Ophthalmic Literature (Joint).

Dr S Judd Berch Portland Maine reported for the Joint Committee on Optics and Visual Physiology. He stated that Dr Alfred Cowan of the Subcommittee on Visual Standards reported that the distance portion of the American Medical Association rating card in percentages did not correspond to the near part and recommended that the near part be made so that it is consistent with the distant part.

Dr Albert C Snell, Rochester, N Y gave the report of the Committee on Industrial Ophthalmology.

There was no report from the representative to the Council of the Pan American Congress. Dr William L Benedict, Rochester Minn.

Dr Derrick Vail Cincinnati, read the report of the Committee on the Knapp Testimonial Fund.

Dr Arthur J Bedell, Albany N Y, reported as delegate of the section to the House of Delegates.

On motion made by Dr E C Ellett, Memphis Tenn seconded by Dr Fred H Verhoeff Boston a vote of thanks was extended to Dr Bedell for his long and satisfactory service in representing the section in the House of Delegates.

The following committee for awarding the Knapp Medal for 1942 was elected from the floor: Dr John Woolfolk Burke Washington D C, Dr Frank E Burch, St Paul, and Dr E C Ellett, Memphis, Tenn.

On motion made by Dr Conrad Berens, New York seconded by Dr Harry S Gradle Chicago, it was voted to accept all reports that had been presented.

The following officers were elected: chairman, Dr Conrad Berens, New York, vice chairman Dr Robert von der Heydt, Chicago, secretary Dr Derrick Vail, Cincinnati, executive committee Dr Albert C Snell, Rochester N Y, Dr Lawrence T Post St Louis, Dr Conrad Berens New York, delegate Dr Arthur J Bedell, Albany, N Y, alternate, Dr Shaler A Richardson, Jacksonville Fla.

The following committee appointments were recommended by the executive committee and approved:

To fill a vacancy on the American Committee (Joint) on Optics and Visual Physiology, representing the Section on Ophthalmology, the reappointment of Dr Sanford Gifford Chicago, to serve for a term of three years.

The reelection of Dr Conrad Berens, New York to the Committee on American Board of Ophthalmology to serve for a term of four years.

As representative of the section to the College of Surgeons Board of Governors Dr M Hayward Post St Louis, for a term of one year.

The appointment of Dr J V Cassidy, South Bend, Ind, to fill a vacancy on the Committee on Industrial Ophthalmology (Joint).

The appointment of Dr Walter B Lancaster Hanover, N H, to the American Orthoptic Council for a term of three years, to fill a vacancy.

To the Committee on Scientific Exhibit from the section, the appointment of Dr A B Reese, New York.

To continue unchanged the Committee on Visual Economics, the Committee on National Museum of Ophthalmic Pathology, the Committee on Museum of Ophthalmic History, the Advisory Committee of Student Health Association and the Committee on Ophthalmic Literature (Joint).

The Research Medal Award was presented in absentia to Dr Manuel Uribe Troncoso New York.

*Scientific Session*

Dr Edmund B Spaeth, Philadelphia, read a paper on "The Removal of Metallic Foreign Bodies from the Eyeball and the Orbit" Discussed by Drs Edward Stieren, Pittsburgh, Raymond L Pfeiffer, New York, Harvey E Thorpe, Pittsburgh, Oscar Wilkinson, Washington, D C, Elbert S Sherman, Newark, N J, and Edmund B Spaeth, Philadelphia

Dr Lowell S Selling, Detroit, read a paper on "The Ophthalmologist's Place in the Prevention of Traffic Accidents" Discussed by Drs S Judd Beach, Portland, Maine, Albert C Snell, Rochester, N Y, and Lowell S Selling, Detroit

Dr John S McGavic, New York, read a paper on "Lymphomatous Tumors of the Eye and Its Adnexa" Discussed by Drs William L Benedict, Rochester, Minn, Benjamin Rones, Washington, D C, Arthur J Bedell, Albany, N Y, and John S McGavic, New York

Dr James W Smith, New York, read a paper on "Ochrosis of the Sclera and Cornea Complicating Alkaptonuria. Review of the Literature and Report of Four Cases" Discussed by Drs Milton L Berliner, New York, and James W Smith, New York

## SECTION ON LARYNGOLOGY, OTOTOLOGY AND RHINOLOGY

WEDNESDAY, JUNE 10—AFTERNOON

The meeting was called to order at 2 05 by the chairman, Dr Gordon F Harkness, Davenport, Iowa

Dr Herman J Sternstein, Boston, read a paper on "A Quantitative Evaluation of Vasoconstrictor Agents in the Obstructed Nose" Discussed by Drs A C Hilding, Duluth, Minn, Lewis T Buckman, Wilkes-Barre, Pa, John J Shea, Memphis, Tenn, and Herman J Sternstein, Boston

*Executive Session*

Dr Burt R Shurly, Detroit, delegate from the section, reported concerning the resolution proposed in the House of Delegates depriving section delegates of the right to vote

*Scientific Session*

Dr Henry B Orton, Newark, N J, read a paper on "Diagnosis and Treatment of Deep Neck Infections" Discussed by Drs August L Beck, New Rochelle, N Y, Samuel Iglauer, Cincinnati, and Henry B Orton, Newark, N J

Dr Daniel S Cuning, New York, read a paper on "Rhinoscleroma" Discussed by Dr Francis Carter Wood, New York, Fred W Dixon, Cleveland, Joseph I Kemler, Baltimore, and Daniel S Cuning, New York

Dr Leon D Carson, Washington, D C, read a paper on "Otolaryngologic Problems Occurring in Fliers" Discussed by Drs R J Hunter, Philadelphia, A H Andrews Jr, Chicago, Herman J Sternstein, Boston, and Leon D Carson, Washington, D C

Dr Joseph C Donnelly, Philadelphia, read a paper on "Pulmonary Tuberculosis Masquerading as Laryngitis" Discussed by Drs Frank R Spencer, Boulder, Colo, Frederick T Hill, Waterville, Maine, Joseph I Kemler, Baltimore, and Joseph C Donnelly, Philadelphia

*Executive Session*

By unanimous vote, Lieut Col Lee S Fountain, 309 Thelma Drive, San Antonio, Texas, and Harold H Murray, DMD, 710 General Insurance Building, Seattle, were nominated for election to Associate Fellowship in the American Medical Association

THURSDAY, JUNE 11—AFTERNOON

*Executive Session*

The following officers were elected chairman, Dr Claude C Cody Jr, Houston, Texas, vice chairman, Dr William H Johnston, Santa Barbara, Calif, secretary, Dr Louis H Clerf, Philadelphia, executive committee Dr LeRoy A Schall, Bos-

ton, Dr Gordon F Harkness, Davenport, Iowa, and Dr Claude C Cody Jr, Houston, Texas, delegate, Dr Burt R Shurly, Detroit, alternate, Dr Gordon F Harkness, Davenport, Iowa

Dr John J Shea, Memphis, Tenn, reported for the American Board of Otolaryngology that forty-three examinations had been held since 1924 in twenty-four different cities and that a total of 3,467 otolaryngologists had been certificated Dr Shea stated that Dr Joseph C Beck, Chicago, the other member of the section on the board, was ill, and suggested that flowers be sent to him

Dr W E Grove, Milwaukee, read the report of the Consultants' Committee to the Council on Physical Therapy of the American Medical Association and moved its adoption The motion was regularly seconded and carried

The chairman announced that the Council on Industrial Health had requested the appointment of an advisory committee to work with it in the field of otolaryngology, and Dean Lerk, Iowa City, W E Grove, Milwaukee, and Carlton Stewart Nash, Rochester, N Y, were appointed, with the officers of the section as ex officio members and Dr George Shambaugh, Chicago, chairman

The chairman appointed Dr W E Grove, Milwaukee, as a candidate for the board of governors of the American College of Surgeons

*Scientific Session*

Dr Gordon F Harkness, Davenport, Iowa, read the chairman's address, entitled "Postgraduate Education and Delivery Medical Service"

Dr John J Shea, Memphis, Tenn, read a paper on "The Management of Fractures Involving the Paranasal Sinus" Discussed by Drs Claire L Straith, Detroit, Robert H Iv, Philadelphia, C C Coleman, Richmond, Va, M F Arbuckle, St Louis, and John J Shea, Memphis, Tenn

Dr Simon Jesberg, Los Angeles, read a paper on "Laryngeal Stenosis" Discussed by Drs Fletcher D Woodward, Charlottesville, Va, M F Arbuckle, St Louis, and Simon Jesberg, Los Angeles

Dr Edmund P Fowler, New York, read a paper on "A Simple Method for Measuring the Percentage of Capacity for Hearing Speech" Discussed by Drs W E Grove, Milwaukee, and Douglas Macfarlan, Philadelphia

FRIDAY, JUNE 12—MORNING

A joint meeting was held with the Section on Pediatrics The proceedings are reported in the minutes of that section

## SECTION ON PEDIATRICS

WEDNESDAY, JUNE 10—MORNING

The meeting was called to order at 9 20 by the chairman Philip M Stimson, New York

Dr Stanley Nichols, Asbury Park, N J, presented a resolution to be submitted to the House of Delegates urging the creation of a Section on Pediatrics of the American Medical Association and the various governmental agencies concerned (Office of Public Health, Welfare Services, Children's Bureau and Office of Civilian Defense) to work cooperatively for better child health during the war

Dr William A Schonfeld, New York, read a paper on "The Development of Male Pubescence" No discussion

Drs Philip Cohen and Samuel J Scadron, New York, presented a paper on "Placental Transmission of Pertussis Bodies Following Inoculation of the Mother During Pregnancy" Discussed by Drs Samuel J Scadron, New York, and L Bradford, Rochester, N Y

Drs Joseph Stokes Jr and Werner Henle, Philadelphia, presented a paper on "Studies on Methods of Prevention of Epidemic Influenza" Discussed by Drs Albert B Stern, Cincinnati, and E C Rosenow, Rochester, Minn

Drs William F Peterson and Alvin Mayne Chicago presented a paper on 'Cytoplasmic Modification of Genetic Trends as Observed in the Newborn' Discussed by Dr Alvin Mayne Chicago

Drs Abraham M Litvak Irving J Sands and Harry Gibel Brooklyn presented a paper on "Measles Encephalitis Report of Fifty Six Cases with Follow Up Studies in Thirty Cases" Discussed by Drs Murray B Gordon Brooklyn Irving I Sands Brooklyn and Joseph Stokes Jr Philadelphia

Drs Abram Kanof Isidor Leber and Benjamin Kramer Brooklyn, presented a paper on Chemotherapy in Childhood Sepsis Discussed by Drs Reuben Ottenberg New York George J Boines, Wilmington Del and Benjamin Kramer, Brooklyn

#### THURSDAY JUNE 11—MORNING

The secretary, Dr Hugh L Dwyer Kansas City Mo presented a report on the Abraham Jacoby Memorial Fund Dr Albert D Kaiser Rochester N Y presented a motion for the adoption of a resolution proposing that this fund be used as the initial endowment fund for the establishment of a Pediatric Historical Museum to be operated by a joint museum board of the Section on Pediatrics of the American Medical Association the American Academy of Pediatrics and the American Pediatrics Society The motion was seconded by Dr William D Weston Columbia S C and carried unanimously

The following officers were elected chairman Dr Hugh L Dwyer Kansas City Mo vice chairman Dr Francis Scott Smyth San Francisco secretary Dr Gilbert J Levy, Memphis Tenn, delegate, Dr William Weston Columbia S C alternate Dr Julius H Hess, Chicago representative to the Scientific Exhibit Dr Sterling H Ashmun Dayton Ohio representative to the American Board of Pediatrics Dr Edward Shaw San Francisco

Drs Frank C Neff, Kansas City Mo Hugh L Dwyer Kansas City, Mo, and Albert D Kaiser, Rochester, N Y, were elected representatives of the section on the Pediatrics Museum Board

A report of the representatives of the section on the American Board of Pediatrics was presented by Dr Hugh L Dwyer Kansas City Mo

Dr Philip M Stimson, New York read the chairman's address, entitled "A Rationalization of the Sister Kenny Treatment of Poliomyelitis"

Dr George W Caldwell New York, read a paper on "Treatment of Nephrosis with Vitamin A and Unsaturated Fatty Acid Therapy" Discussed by Dr Marshall C Pease Jr, New York

Drs Herman Schwarz Jerome L Kohn and Samuel Weiner New York, presented a paper on 'Observations on Lipoid Nephrosis over a Period of Twenty Years' Discussed by Dr Lee E Farr, Wilmington Del

Drs I Michael Levin Samuel J Hoffman, David S Koransky Irving B Richter and Bernard Gumbiner, Chicago presented a paper on "Congenital and Acquired Syphilis in Infants and Children Treatment with Massive Doses of Arsenic Intravenously" Discussed by Dr Samuel J Hoffman Chicago

Drs H Harris Perlman and A M Dannenberg Philadelphia presented a paper on 'Nicotine Excretion in Breast Milk and Urine from Cigaret Smoking Its Effect on Nursing' Discussed by Dr W B Thompson, Los Angeles

Drs Jesse G M Bullowa and Janet D Alterman New York, presented a paper on 'Pertussis Immunity with Toxin and with Antitoxin' Discussed by Dr Lewis Henry Koplik New York

#### FRIDAY, JUNE 12—MORNING

A joint meeting was held with the Section on Laryngology Otolaryngology and Rhinology

Dr D E Staunton Wishart Toronto Ont read a paper on 'Bronchiectasis and Sinusitis in Children Their Interrelationship and Treatment' Discussed by Dr Louis H Clerf Philadelphia

Drs Adolph G DeSanctis and Vincent deP Larkin New York presented a paper on 'A Survey of Two Thousand Cases of Otitis Media and Mastoiditis in Children' Discussed by Dr Vincent deP Larkin, New York

Dr James Sonnett Greene New York read a paper on "Atypical Laryngeal and Vocal Changes in Adolescence" Discussed by Dr George B Dorff Brooklyn

Dr Myron F Metzger Cleveland read a paper on "Fractures and Dislocations of the Outer and Inner Nasal Framework in Infants and Young Children and Orthopedic Methods for their correction"

Dr James B Costen St Louis read a paper on "Reflex Pain Effects Produced by Abnormal Movement of the Lower Jaw" Discussed by Drs Braswell E Collins Wavcross Ga, and A E Bennett Omaha

### SECTION ON EXPERIMENTAL MEDICINE AND THERAPEUTICS

#### WEDNESDAY JUNE 10—MORNING

The meeting was called to order at 9 o'clock by the chairman, Dr Wallace M Yater Washington D C

Drs Robert M Daley and Harry E Ungerleider New York, and Richard S Gubner Brooklyn presented a paper on "Prognosis in Hypertension" Discussed by Dr Benjamin Jablons New York

Dr O P J Falk St Louis read a paper on 'The Causes and Prevention of Sudden Death in Coronary Disease'

Dr Edward L Bortz Philadelphia read a paper on "Therapeutics of Pneumonia on a Statewide Basis" Discussed by Drs Hobart A Reimann Philadelphia and Walter F Donaldson Pittsburgh

Drs Ignacio Chavez and B Sepulveda, Mexico City Mexico presented a paper on "The Functional Value of the Liver in Heart Failure Experimental Study" Discussed by Drs George Herrmann Galveston Texas A P Munsch, St Louis and Ignacio Chavez Mexico City Mexico

Drs Morris T Friedell and C M Shaar Philadelphia, presented a paper on 'Effect of Gastric Resection on Gastric Acidity' Discussed by Drs Waltman Walters, Rochester Minn and C M Shaar Philadelphia

Drs George V Byfield, Stanley E Telser and Robert W Keeton Chicago, presented a paper on "Observations on Renal Blood Flow and Glomerular Filtration Rate as Influenced by Environmental Temperature Changes" Discussed by Dr Benjamin Jablons New York

Dr Samuel S Altshuler Detroit, read a paper on "Clinical Use of Amino Acids for the Maintenance of Nitrogen Equilibrium" Discussed by Drs Melville Sahyun (PhD), Detroit, Harry Koster, Brooklyn and Samuel S Altshuler, Detroit

#### THURSDAY JUNE 11—MORNING

The following officers were elected chairman Tinsley R Harrison, Winston-Salem, N C vice chairman, Edgar V Allen Rochester, Minn secretary, D L Wilbur, San Francisco, delegate, O P J Falk St Louis alternate Garnett Cheney, San Francisco representative to the Scientific Exhibit George Herrmann Galveston Texas, executive committee C M Gruber, Philadelphia Wallace M Yater, Washington D C and Tinsley R Harrison Winston-Salem N C

Dr Wallace M Yater Washington D C read the chairman's address entitled 'What's Wrong with Modern Therapeutics?'

Drs Leon Unger and A Alvin Wolf Chicago presented a paper on 'Treatment of Bronchial Asthma A Survey of the Value of Treatment During Twenty Years' Discussed by Drs Ralph G Mills Decatur Ill George F Harsh San Diego Calif Herbert F Robb Belleville Mich and Leon Unger Chicago

Drs Carl V Moore, St Louis, Richard W Vilter and Tom D Spies, Cincinnati, presented a paper on "Treatment of Anemia Associated with Uncorrected Vitamin Deficiency Beneficial Effects of Iron" Discussed by Drs William Dameshek, Boston, and Carl V Moore, Cincinnati

Drs Janet G Travell, Seymour H Rinzler and Myron Herman, New York, presented a paper on "Treatment of Pain and Disability of Shoulder and Arm by Intramuscular Injection of Procaine Hydrochloride"

Drs R H Kampmeier and H B Henning, Nashville, Tenn, presented a paper on "Treatment of Syphilis with Chlorarsen" Discussed by Drs Walter E Vest, Huntington, W Va, and R H Kampmeier, Nashville, Tenn

Dr R H Freyberg, Ann Arbor, Mich, read a paper on "Treatment of Arthritis with Vitamin and Endocrine Preparations Emphasis of Their Limited Value"

Dr Carl H Greene, New York, read a paper on "The Treatment of Portal Cirrhosis Physiologic Considerations" Discussed by Drs Seymour J Gray, Chicago, Wallace M Yater, Washington, D C, and Carl H Greene, New York

#### FRIDAY, JUNE 12—MORNING

A joint meeting was held with the Section on Practice of Medicine

Drs Irving S Wright and Andrew G Prandoni, New York, presented a paper on "Dicoumarin [3,3'-Methylene-Bis-(4-Hydroxycoumarin)] Its Pharmacologic and Therapeutic Action in Man"

Drs Jesse L Bollman and F W Preston, Rochester, Minn, presented a paper on "Dicoumarin [3,3'-Methylene-Bis-(4-Hydroxycoumarin)] Experimental Studies"

Drs Edgar V Allen, Nelson W Barker and John M Waugh, Rochester, Minn, presented a paper on "Dicoumarin [3,3'-Methylene-Bis-(4-Hydroxycoumarin)] Clinical Studies"

These three papers were discussed by Drs Shepard Shapiro, New York, and K K Chen, Indianapolis

Drs Lester M Morrison, William A Swalm, W Emery Burnett, Frank W Konzelmann and Earle H Spaulding, Philadelphia, presented a paper on "The Response of Experimental and Clinical Gallbladder Infections to Sulfonamide Compounds" Discussed by Dr William A Swalm, Philadelphia

Drs M J Shapiro and Ancel B Keys, Minneapolis, presented a paper on "An Analysis of the Operative Treatment of Patent Ductus Arteriosus" Discussed by Drs John P Hubbard, Boston, Arthur S W Touroff, New York, and M J Shapiro, Minneapolis

Drs Arthur M Master, Bethesda, Md, and Simon Dack and Harry L Jaffe, New York, presented a paper on "Cardiac Efficiency Following Recovery from Acute Coronary Occlusion The Results of Various Functional Tests" Discussed by Drs Cary Eggleston, New York, Howard B Sprague, Newport, R I, and Arthur M Master, Bethesda, Md

Drs Howard B Sprague, Newport, R I, and Harold E B Pardee, New York, presented an unprepared, informal discussion of electrocardiograms

### SECTION ON PATHOLOGY AND PHYSIOLOGY

#### WEDNESDAY, JUNE 10—AFTERNOON

The meeting was called to order at 2 o'clock by the chairman, Dr J P Simonds, Chicago

Dr J P Simonds, Chicago, read the chairman's address, entitled "Clinical Interpretation of Renal Pathology in Hypertension and Glomerulonephritis"

Drs George E Wakerlin and C A Johnson, Chicago, presented a paper on "Treatment of Experimental Renal Hypertension with Renin" Discussed by Drs Tinsley R Harrison, Winston-Salem, N C, Benjamin Jablons, New York, and George E Wakerlin, Chicago

Drs Piero Pio Foa, Ward W Woods and Max M Pectin, Ann Arbor, Mich, presented a paper on "Effect of Splanchnic Flow on Renal Blood Flow in Arterial Hypertension" Discussed by Drs Harold Lamport, New York, Hugo A Freund, Detroit, George E Wakerlin, Chicago, and Piero Pio Foa, Ann Arbor, Mich

Dr Alberto Hurtado, Lima, Peru, read a paper on "Chronic Altitude Sickness"

Dr Gail M Dack, Chicago, read a paper on "Characteristics of Food Poisoning Outbreaks of Bacterial Origin" Discussed by Drs George J Bones, Wilmington, Del, and Gail M Dack, Chicago

Dr Israel Davidsohn, Chicago, read a paper on "Irregular Isoagglutinins" Discussed by Drs Philip Levine, New York, N J, Frederic Feldman, Brooklyn, and Israel Davidsohn, Chicago

A nonvoting committee was appointed, consisting of Dr George E Wakerlin, Chicago, Frank W Hartman, Detroit, and Eustice L Benjamin, Evanston, Ill

On motion by Dr Hugo A Freund, Detroit, seconded by Dr J J Moore, Chicago, it was voted to recommend to the House of Delegates of the American Medical Association the election of Milan V Novak, Ph D, M D, Chicago, and Clarence W Muehlberger, Ph D, Lansing, Mich, to Associate Fellowship in the American Medical Association

#### THURSDAY, JUNE 11—AFTERNOON

The chairman appointed Dr George E Wakerlin, Chicago, to serve on the executive committee in the absence of Dr Carl Wiggers, Cleveland

The following officers were elected chairman, Frank Mann, Rochester, Minn, vice chairman, Virgil H Moon, Philadelphia, secretary, J J Moore, Chicago, delegate, Leonard W Larson, Bismarck, N D, alternate, J J Moore, Chicago, executive committee Carl J Wiggers, Cleveland, I I Simonds, Chicago, and Frank C Mann, Rochester, Minn

The chairman appointed Frank W Konzelmann, Philadelphia, as representative to the Scientific Exhibit

Drs Winfield L Butsch, Buffalo, read a paper on "Clinical Experiences with 3,3'-Methylene-Bis-(4-Hydroxycoumarin)" Discussed by Dr Alton Ochsner, New Orleans

Dr David I Macht, Baltimore, read a paper on "Experimental Studies Concerning Heparin" Discussed by Drs J McLean, Columbus, Ohio, Geza de Takats, Chicago, R H Foster, Nutley, N J, N C Gilbert, Chicago, and David I Macht, Baltimore

Dr Albert C Hunter, Washington, D C, read a paper on "The Evaluation of Antiseptics" Discussed by Dr W MacNeal, New York, and Albert C Hunter, Washington, D C

Drs Roy R Kracke, Emory University, Ga, and Flor Townsend, Atlanta, Ga, presented a paper on "The Effect of the Sulfonamide Drugs on the Blood Platelets" Discussed by Drs David I Macht, Baltimore, Harry J Corper, Denver, and Roy R Kracke, Emory University, Ga

Drs Harry J Corper and Maurice L Cohn, Denver, presented a paper on "The Presence of Acidulent Tubercle in Pulmonary Tuberculosis in Man"

Dr Frank W Hartman, Detroit, read a paper on "Relative Value of Pectin Solution in Shock" Discussed by Drs Samuel D Jacobson, Eloise, Mich, Harry J Corper, Detroit, Virgil H Moon, Philadelphia, and Frank W Hartman, Detroit

The delegate, Dr Leonard W Larson, Bismarck, N D, presented a report on the proceedings of the House of Delegates

#### FRIDAY, JUNE 12—MORNING

A joint meeting was held with the Section on Gynecology and Proctology The proceedings are reported in the minutes of that section

## SECTION ON NERVOUS AND MENTAL DISEASES

WEDNESDAY, JUNE 10—MORNING

The meeting was called to order at 9:15 by the vice chairman, Dr. A. R. Vonderahe, Cincinnati.

Drs. Franklin G. Ebaugh and Charles A. Rimer, Denver, presented a paper on "Critical Review of Shock Therapies." Discussed by Drs. A. E. Bennett, Omaha, Walter Freeman, Washington, D. C., and Franklin G. Ebaugh, Denver.

Dr. Louis A. Lurie, Cincinnati, read a paper on "Personality Changes and Behavior Disorders of Children Due to Pertussis: A Report Based on the Study of Five Hundred Problem Children." Discussed by Drs. A. R. Vonderahe, Cincinnati, Charles Bradley, East Providence, R. I., and Louis A. Lurie, Cincinnati.

Drs. Walter L. Voegtlin, Frederick Lemere and Paul F. O'Hollaren, Seattle, presented a paper on "Conditioned Reflex Treatment of Chronic Alcoholism." Discussed by Drs. Joseph Thimann, Boston, James P. King, Radford, Va., Robert V. Seliger, Baltimore, and Frederick Lemere, Seattle.

Dr. A. Earl Walker, Chicago, read a paper on "Mesencephalic Tractotomy: A Method for the Relief of Unilateral Intractable Pain." Discussed by Drs. Francis C. Grant, Philadelphia, Mary M. Peet, Ann Arbor, Mich., Paul C. Bucy, Chicago, and A. Earl Walker, Chicago.

Dr. J. Rudolph Jaeger, Denver, read a paper on "Ligation of the Superior Longitudinal Sinus." Discussed by Drs. James L. Poppen, Boston, J. W. Watts, Washington, D. C., and J. Rudolph Jaeger, Denver.

THURSDAY, JUNE 11—MORNING

The following officers were elected: chairman, J. M. Nielsen, Los Angeles; vice chairman, Theodore A. Watters, New Orleans; secretary, R. P. Mackay, Chicago; executive committee: Tom B. Throckmorton, Des Moines, Iowa; Stanley Cobb, Boston; and J. M. Nielsen, Los Angeles; delegate, Henry R. Viets, Boston; alternate, Joseph P. Evans, Cincinnati; representative to Scientific Exhibit, Frederick P. Moersch, Rochester, Minn.; representative to American Board of Psychiatry and Neurology, Percival Bailey, Chicago; representative to American Board of Neurological Surgery, Paul C. Bucy, Chicago.

Dr. Paul C. Bucy, Chicago, gave a report from the American Board of Neurological Surgery, reporting that the board was planning to hold another examination in Chicago this week, particularly for young men being called into the armed forces. The report was received and placed on file.

The report of the Committee on Industrial Neuropsychiatry was given by Dr. Paul C. Bucy, Chicago, in the absence of Dr. Theodore T. Stone, Chicago. The report was received and placed on file.

Dr. Walter Freeman, Washington, D. C., gave a report from the American Board of Psychiatry and Neurology, reporting one thousand, four hundred and fifty-five diplomates. The report was received and placed on file.

Motion was made, seconded and carried that the secretary send a telegram to Dr. Stanley Cobb, Boston, chairman of the section, who was absent from the meeting.

Drs. Joseph H. Globus, New York, and Milton R. Saperstein, Bellerose, N. Y., presented a paper on "Massive Hemorrhage into Brain Tumor: Its Significance and Probable Relationship to Rapidly Fatal Termination and Antecedent Trauma." Discussed by Drs. Paul C. Bucy, Chicago, and Joseph H. Globus, New York.

Drs. W. McD. Hammon, San Francisco, and Frederik B. Bang, Princeton, N. J., presented a paper on "Epidemiologic Studies of Encephalitis, Eastern and Western Equine and St. Louis Types in Several Western States."

Drs. James P. Leake, Bethesda, Md., J. O. Arnson, Bismarck, N. D., F. I. Darrow, Fargo, N. D., R. E. Dyson, Minot, N. D., A. C. Fortney, Fargo, N. D., F. J. Hill, Bismarck, N. D., O. W. Johnson, Rugby, N. D., and L. W. Larson, Bismarck, N. D., presented a paper on "Epidemic of Encephalitis of 1941."

These two papers were discussed by Drs. Carl TenBroeck, Princeton, N. J., E. C. Rosenow, Rochester, Minn., Irving J. Sands, Brooklyn, Max H. Weinberg, Pittsburgh, Joseph W. Mountain, Washington, D. C., L. W. Larson, Bismarck, N. D., Frederik B. Bang, Princeton, N. J., and James P. Leake, Bethesda, Md.

Dr. Eben J. Carey, Milwaukee, read a paper on "Physiologic and Pathologic Amoeboid Motions of Motor End Plates." Discussed by Drs. Ernest A. Spiegel, Philadelphia, and Eben J. Carey, Milwaukee.

Dr. Michael Scott, Philadelphia, read a paper on "Nontraumatic Effusions (Hygromas) of the Subdural Space as a Cause of Obscure Cerebral Symptoms." Discussed by Drs. Ernest A. Spiegel, Philadelphia, Paul C. Bucy, Chicago, and Michael Scott, Philadelphia.

Dr. Eric Miles Atkinson, New York, read a paper on "Miere's Syndrome and Migraine: Observations on a Common Causal Relationship." Discussed by Drs. Bayard T. Horton, Rochester, Minn., Mary Elizabeth O'Sullivan, New York, Wilbur A. Muchlig, Omaha, and Eric Miles Atkinson, New York.

FRIDAY, JUNE 12—MORNING

A joint meeting was held with the Section on Orthopedic Surgery.

Drs. Ralph K. Ghormley, J. Grafton Love and Henry Herman Young, Rochester, Minn., presented a paper on "The 'Combined Operation' in Low Back and Sciatic Pain." Discussed by Drs. Henry Briggs, East Orange, N. J., A. W. Adson, Rochester, Minn., Lee A. Hadley, Syracuse, N. Y., Edwin W. Ryerson, Chicago, and Ralph K. Ghormley, Rochester, Minn.

Dr. Henry R. Viets, Boston, gave a report as delegate to the House of Delegates.

A Panel Discussion on Poliomyelitis was participated in by Drs. A. R. Vonderahe, Cincinnati, moderator, D. Y. Solandt, Toronto, Ont., Albert B. Sabin, Cincinnati, H. M. Hines, Iowa City, H. R. McCarroll, St. Louis, and Frank R. Ober, Boston.

## SECTION ON DERMATOLOGY AND SYPHILOLOGY

WEDNESDAY, JUNE 10—MORNING

The meeting was called to order at 9 o'clock by the chairman, Dr. C. F. Lehmann, San Antonio, Texas.

Dr. Clyde L. Cummer, Cleveland, representative of the section in the House of Delegates, reported on the recommendations of the Judicial Council to the House of Delegates that the Constitution, article 5, section 2, be amended to make delegates elected by the sections of the Scientific Assembly ex officio delegates without the right to vote or because of the number of members of the Association now in government service and, therefore, unlikely to wield influence on their representation in this House of Delegates, that all action be postponed and the reappointment in 1943 be made under the present constitutional provisions.

On motion made by Dr. Cummer, seconded by Dr. J. Gardner Hopkins, New York, and carried, it was voted that the section express itself as opposed to the withdrawal of the vote from its representative to the House of Delegates, the exact wording of the resolution to be left with the executive committee to be presented at the section meeting on Thursday, for use in the final meeting of the House of Delegates in the afternoon.

Dr. Howard Fox, New York, editor of the ARCHIVES OF DERMATOLOGY AND SYPHILOLOGY, read his report.

Dr. C. F. Lehmann, San Antonio, Texas, read the chairman's address, entitled "Dermatology in the Armed Forces."

Drs. V. Pardo Castello and Francisco R. Tiant, Havana, Cuba, presented a paper on "Leprosy: The Correlation of Its Clinical, Immunologic, Pathologic and Bacteriologic Aspects." Discussed by Drs. Howard Fox, New York, Marion B. Sulzberger, New York, Alfred Hollander, Springfield, Mass., Paul Gross, New York, Guy H. Faget, Carville, La., Fred D. Weidman, Philadelphia, and V. Pardo Castello, Havana.

Drs William H Kaufman and Dudley C Smith, Charlottesville, Va, presented a paper on "Cutaneous Changes in the Sprue Syndrome" Discussed by Drs J Lamar Callaway, Durham, N C, Herman Sharlit, New York, Paul Gross, New York, E Myles Standish, Hartford, Conn, Merlin T-R Maynard, San Jose, Calif, and Dudley C Smith, Charlottesville, Va

Dr William H Guy, Pittsburgh, read a paper entitled "Dermatologists for the Army and Navy" Discussed by Drs Marion B Sulzberger, New York, Howard Fox, New York, Donald M Pillsbury, Philadelphia, C Guy Lane, Boston, Dudley C Smith, Charlottesville, Va, Davis W Goldstein, Fort Smith, Ark, and William H Guy, Pittsburgh

Dr Carmen C Thomas, Philadelphia, read a paper on "Sarcoid Disease" Discussed by Drs Cleveland J White, Chicago, George T Harrell, Winston-Salem, N C, J Lamar Callaway, Durham, N C, Francis A Ellis, Baltimore, Paul E Bechet, New York, Fred D Weidman, Philadelphia, Walter C Jones, Birmingham, Ala, Adolph Rostenberg Jr, Washington, D C, Carmen C Thomas, Philadelphia, and George T Harrell, Winston-Salem, N C

Drs Adolph H Conrad, Adolph H Conrad Jr and Richard S Weiss, St Louis presented a paper on "Sesame Oil Tumors" Discussed by Drs Fred D Weidman, Philadelphia, Francis A Ellis, Baltimore, J Lowry Miller, New York, and Adolph H Conrad, St Louis

Dr J Lowry Miller, New York, read a paper on "Primary Relapsing Febrile Nodular Panniculitis" Owing to the lateness of the hour, discussion on the paper was postponed until the meeting of the section on Thursday morning

#### THURSDAY, JUNE 11—MORNING

The paper read by Dr J Lowry Miller, New York, on "Primary Relapsing Febrile Nodular Panniculitis" at the Wednesday morning session was discussed by Drs Loretta Joy Cummins, Boston, William A Rosenberg, Chicago, Fred D Weidman, Philadelphia, Paul E Bechet, New York, and J Lowry Miller, New York

Dr C Guy Lane, Boston, read the report of the American Board of Dermatology and Syphilology

Dr John G Downing, Boston, read the following resolution from the executive committee

WHEREAS, The suggestion has been made by the Judicial Council of the House of Delegates that the Constitution of the American Medical Association be amended to withdraw the right to vote from the delegates from the scientific sections, be it

Resolved By the Section on Dermatology and Syphilology that it express its objections to this proposal for the following reasons

1 The scientific sections are an integral part of the Association and enhance the value of the meeting to the membership at large through their program and their contributions to the scientific exhibits

2 Intimate relationship to the governing body through a voting delegate to act as liaison officer is desirable to interpret the points of view of each group to the other

3 It would be difficult if not impossible, to secure a member to act as a so called ex officio delegate through the sessions of the House when present only as an observer with no right to participate in the deliberations except on matters directly bearing on his specialty

On motion by Dr Clyde L Cummer, Cleveland, seconded by Dr Fred D Weidman, Philadelphia, it was voted that the resolution be adopted

Drs Arthur W Grace, Brooklyn, and Geoffrey W Rake, New Brunswick, N J, presented a paper on "The Complement Fixation Test for Lymphogranuloma Venereum" Discussed by Drs David Bloom, New York, Helen O Curth, New York, Frank C Combes, New York, Harry M Robinson, Baltimore, Marion B Sulzberger, New York, Harry C Saunders, New York, Maurice J Strauss, New Haven, Conn, and Arthur W Grace, Brooklyn

Drs William A Clark and D Truett Gandy, Houston, Texas, presented a paper on "An Improved Method of Reporting Serologic Tests for Syphilis" Discussed by Drs John H Stokes, Philadelphia, Benjamin S Kline, Cleveland, and William A Clark, Houston, Texas

Dr Reuben L Kahn, Ann Arbor, Mich, read a paper on "Detection of Biologic False Positives in Serologic Reaction of

Syphilis" Discussed by Drs Charles R Rein, New York, Benjamin S Kline, Cleveland, J F Mahoney, Washington, D C, and Reuben L Kahn, Ann Arbor, Mich

Drs Herman Beerman and Bertram Shaffer, Philadelphia and Clarence S Livingood, Indiantown Gap, Pa, presented a paper on "Bismarsen in the Treatment of Syphilis Review of Fourteen Years' Experience"

Drs David Kahn and S William Becker, Chicago, presented a paper on "The Use of Bismuth Compounds in Syphilotherapy. II Results of Treatment of Latent Syphilis by Bismuth Compounds Combined in Part with Arsenicals"

Drs George V Kulchar, San Francisco, and William J Reynolds, San Anselmo, Calif, presented a paper on "Bismuth Hepatitis A Survey of 121 Cases"

These three papers were discussed by Drs Frank C Combes, New York, C J Lunsford, Oakland, Calif, Harry C Saunders, New York, John E Dalton, Indianapolis, Bernard Appel Lynn, Mass, Herman Beerman, Philadelphia, S William Becker, Chicago, and George V Kulchar, San Francisco

Dr Girsch D Astrachan and Van Alstyne H Cornell, New York, presented a paper on "Mapharsen in the Treatment of Congenital Syphilis with Especial Consideration for the Intramuscular Method of Administration" Discussed by Dr Norman R Ingraham, Philadelphia, John E Rauschkolb, Cleveland, and Girsch D Astrachan, New York

#### FRIDAY, JUNE 12—MORNING

Dr C Guy Lane, Boston, read the report of the Committee on Industrial Dermatoses as follows

In the Feb 21, 1942 edition of THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION there appeared a report of the Committee on Occupational Dermatoses which was read at the meeting of the Council on Industrial Health in Chicago. This report discussed particularly the criteria of occupational dermatoses and reviewed the work of the subcommittee which had been appointed. The Committee on Teaching of Occupational Dermatoses has reviewed the questionnaires which were sent out last year which had been received from some eighty odd medical schools and is formulating a plan of teaching based on the analysis of a large number of compensation cases

The Committee on Primary Skin Irritants and Patch Testing is engaged in determining the threshold of irritation in a large number of primary skin irritants. It has also analyzed the questionnaires on patch testing which were sent out last year. The reports will be published shortly

The Committee on Evaluation of Protective Chemicals and Detergents used in Industry has found it necessary to undertake the setting up of standard techniques for the determination of the relative efficacy of these various applications in industry by laboratory and clinical experiments

The Committee on Industrial Medical Formulary is at work on a list of preparations and procedures to be used in the prevention or medical management of cutaneous exposures in industry

The Committee on Case Reports is formulating procedures for the receiving and filing of reports on new and interesting cases

The work of these committees is of increasing importance in view of the definite increase in occupational dermatoses and war developments. With new workers and new industries, emphasis placed on speed and the production of war material, we must realize that there has been and probably will be a large increase in occupational skin cases. Cases of contact dermatitis will need to be scrutinized more carefully for professional factors, and part time and full time industrial physicians and surgeons will need to be more alertly on the watch for manifestations in the personnel of war industries and occupations. The early detection and adequate treatment for the purpose of keeping workmen on their jobs and preventing men and women who are incapacitated back on their jobs as soon as possible and establishment of proper preventive measures to avoid interference with production will be a very important contribution to the war effort of the country as a whole.

Case reports are to be encouraged, particularly with regard to eruptions produced by new chemical agents, new processes, and every attempt should be made to trace the actual cause back to its original cause as accurately as possible. For all dermatologists who are teaching, the committee believes it is very practical and merited to devote somewhat more time to occupational dermatoses even if the time allotted for dermatology in the classroom is reduced.

The committee considers it advisable to suggest a reduction in the time given to the consideration of rare and uncommon cases and even of cosmetic defects in order to emphasize the effects of trauma and injury to the skin and the industrial and military aspects of various dermatoses.

It is important that postgraduate courses for instruction in occupational aspects of skin disease be established in some of the larger centers for both dermatologists in that region and local physicians who may be participating in part time or full time industrial practice.

In such courses emphasis should be placed on detection, therapy and prevention of most common industrial dermatoses in that particular section of the country. If there were time, consideration could well be given to the dermatitis in burns caused by agents of chemical warfare which will undoubtedly occur in centers where such materials are being produced.

The committee recommends the appointment of Dr. Louis Schwartz Bethesda, Md. of the Office of Dermatoses Investigation Bureau of the Public Health Service to this committee in view of his numerous excellent contributions to this subject and his interest in this field.

The committee wishes to emphasize that more persons with skin disease due to occupational factors are being seen and will be seen in the next few years and that the members of this section can make a distinct contribution to the war effort by adequate, intelligent management of such cases.

On motion made by Dr. Marion B. Sulzberger, New York, seconded by Dr. C. Guy Lane, Boston, Dr. Louis Schwartz, Director of the Bureau of Dermatoses Investigation, U. S. Public Health Service, Bethesda, Md. was elected to the Committee on Industrial Dermatoses.

The following officers were elected: chairman, Dr. Clark W. Finnerud, Chicago; vice chairman, Dr. Frank J. Eichenlaub, Washington, D. C.; secretary, Dr. Nelson Paul Anderson, Los Angeles; delegate, Dr. Clyde L. Cummer, Cleveland; alternate, Dr. C. F. Lehmann, San Antonio, Texas; representative to Scientific Exhibit, Dr. Hamilton Montgomery, Rochester, Minn.; member of the American Board of Dermatology, Dr. Charles C. Dennis, Kansas City, Mo.

Drs. James R. Driver and Donald N. MacVicar, Cleveland read a paper on 'The Treatment of Cutaneous Melanomas.' Discussed by Drs. H. Ford Anderson, Washington, D. C., Eugene F. Traub, New York, Louis A. Brunsting, Rochester, Minn., S. William Becker, Chicago, Alfred Hollander, Springfield, Mass., Francis A. Ellis, Baltimore, and James R. Driver, Cleveland.

Drs. George Miller MacKee, Anthony C. Cipollaro and Arthur Mutscheller, New York, presented a paper on 'Shock Proof X-Ray Apparatus in Dermatology.' Discussed by Drs. C. Guy Lane, Boston, George C. Andrews, New York, Marion B. Sulzberger, New York, Arthur Mutscheller, New York, H. Ford Anderson, Washington, D. C., and Anthony C. Cipollaro, New York.

Dr. Maurice J. Costello, New York, read a paper on 'Microaerophilic Streptococcus Infection Causing Destruction of the Nose.' Discussed by Drs. Frank L. Meleney, New York, Louis A. Brunsting, Rochester, Minn., Morris H. Goodman, Baltimore, and Maurice J. Costello, New York.

Drs. Erich Urbach and Donald M. Pillsbury, Philadelphia, presented a paper on 'Phenomenon of Black Dermographism.' Discussed by Drs. Samuel M. Peck, New York, Nelson Paul Anderson, Los Angeles, Marion B. Sulzberger, New York, Paul E. Bechet, New York, and Erich Urbach, Philadelphia.

Dr. Francis M. Thurmon, Boston, read a paper on 'Hydroa Erythema: A Successful Treatment.' Discussed by Drs. John

H. Lamb, Oklahoma City, Clark W. Finnerud, Chicago, Theodore Cornbleet, Chicago, Wiley M. Samis, Miami, Fla., Erich Urbach, Philadelphia, Louis A. Brunsting, Rochester, Minn., J. Lamar Callaway, Durham, N. C., and Francis M. Thurmon, Boston.

Dr. Merlin T. R. Maynard, San Jose, Calif., read a paper on 'Thrombocyte Deficit.' Discussed by Drs. Theodore Cornbleet, Chicago, and Merlin T. R. Maynard, San Jose, Calif.

The report of Dr. Hamilton Montgomery, Rochester, Minn., the representative to the Scientific Exhibit, was read by the chairman, Dr. C. F. Lehmann.

## SECTION ON PREVENTIVE AND INDUSTRIAL MEDICINE AND PUBLIC HEALTH

WEDNESDAY, JUNE 10—AFTERNOON

The meeting was called to order at 2 o'clock by the chairman, Dr. Haven Emerson, New York.

The chairman appointed Dr. C. C. Pierce, New York, secretary pro tem.

The chairman read a letter from Dr. W. A. Sawyer, Rochester, N. Y., secretary of the section relative to his necessary absence owing to his having been sent to England by the National Research Council for a consultation relative to industrial health.

Dr. I. C. Riggan, Richmond, Va., was appointed by the chairman to serve on the executive committee in place of Dr. Harold S. Diehl, Minneapolis, who reported that he was leaving the city.

The members of the executive committee were appointed as the nominating committee.

The chairman read the following resolution which had already been presented to the House of Delegates by the section delegate, Dr. Stanley H. Osborn, Hartford, Conn., as follows:

**WHEREAS** It is well known that there are many individuals with chronic diseases of one type or another who expect to seek medical advice or who have been advised by their physicians to have treatment; and

**WHEREAS** The early symptoms of many diseases are mild in character and many persons postpone treatment recommended by the physician; and

**WHEREAS** Many thousands of physicians have gone into the armed services of the country, and tens or thousands of doctors will soon be commissioned and go to war in the future; therefore be it

**Resolved** That this body recommend that all persons who expect to seek medical opinion or who have had medical or surgical care prescribed for them should seek medical advice or follow such advice while sufficient doctors remain available to the civil population.

Dr. Leopold Braid, New York, moved that the resolution be endorsed and presented to the House of Delegates by the section through its delegate. The motion was seconded by Dr. John A. Ferrell, New York, was put to a vote and was carried.

The chairman read the following resolution:

**WHEREAS** A major inadequacy in the civilian health protection in war as in peace time consequent from the failure of many states and of not less than half the counties in the states to provide even minimum necessary sanitary and other preventive services for health by full time professionally trained medical and auxiliary personnel on a merit system basis supported by adequate tax funds from local and state and where necessary from federal sources; therefore be it

**Resolved** That the Trustees of the American Medical Association be urged to use all appropriate resources and influences of the Association to the end that at the earliest possible date complete coverage of the nation's area and population by local county, district or regional full time modern health services be achieved.

Dr. A. T. McCormack, Louisville, Ky., moved that the section recommend the resolution to the House of Delegates for adoption. The motion was seconded by Dr. John A. Ferrell, New York, and discussed favorably by Drs. John A. Ferrell, New York, A. T. McCormack, Louisville, Ky., Stanley H. Osborn, Hartford, Conn., and Haven Emerson, New York. The motion was put to a vote and was carried.

Drs Donald W Cowan, Harold S Diehl and A B Baker, Minneapolis, presented a paper on "Vitamins for the Prevention of Colds" Discussed by Drs John A Ferrell, New York, Joseph S Lawrence, Albany, N Y, Haven Emerson, New York, Donald W Cowan, Minneapolis, and Harold S Diehl, Minneapolis

Drs Lemuel C McGee, Wilmington, Del, and J Dean Creger, Dublin Va, presented a paper on "Gastrointestinal Disease Among Industrial Workers" Discussed by Drs Frederick H Shillito, New York, Stanley H Osborn, Hartford, Conn, and Lemuel C McGee, Wilmington, Del

Dr Robert T Legge, Berkeley, Calif, read a paper on "Berkeley Plan A Proposed Demonstration for Medical and Nursing Services in Small Plants" Discussed by Drs John R Paul, New Haven, Conn, Haven Emerson, New York, Henry Pleasants Jr, West Chester, Pa, and Robert T Legge, Berkeley, Calif

Dr Walter L Bierring, Des Moines, Iowa, read a paper on "Postgraduate Education in Industrial Health" Discussed by Drs Fred J Wampler, Richmond, Va, Haven Emerson, New York, John A Ferrell, New York, Stanley H Osborn, Hartford, Conn, and Walter L Bierring, Des Moines, Iowa

Dr L G Rowntree, Washington, D C, read a paper on "Rehabilitation and Prehabilitation"

#### THURSDAY, JUNE 11—AFTERNOON

Dr Haven Emerson, New York, read the chairman's address, entitled "Civilian Health in War Time"

Dr Donald K Freedman, Washington, D C, read a paper on "Health Problems in War Housing" Discussed by Drs Joseph W Mountin, Washington, D C, A S Leven, Chicago, H R O'Brien, Hartford, Conn, Gracie R Rowntree, Louisville, Ky, and Donald K Freedman, Washington, D C

Dr A J Aselmeyer, Washington, D C, read a paper on "Civilian Measures for the Control of Venereal Diseases in World War II" Discussed by Drs John H Stokes, Philadelphia, Charles M Carpenter, Rochester, N Y, N O Gunderson, Rockford, Ill, Theodore Rosenthal, New York, Haven Emerson, New York, C Walter Clarke, New York, and A J Aselmeyer, Washington, D C

Drs William W Frye and Alvin E Keller, Nashville, Tenn, presented a paper on "The Hospital and the Syphilis Problem in Prospective Blood Donors" Discussed by Drs Haven Emerson, New York, Joseph W Mountin, Washington, D C, William C Woodward, Washington, D C, H R O'Brien, Hartford, Conn, and William W Frye, Nashville, Tenn

#### FRIDAY, JUNE 12—AFTERNOON

Dr Sidney Franklin, Newberry, Mich, was appointed secretary pro tem, Dr Pierce having been obliged to leave the city

The following officers were elected chairman, Dr Joseph W Mountin, Washington, D C, vice chairman, Dr E L Stebbins, New York, secretary, Dr W A Sawyer, Rochester, N Y, executive committee Dr Clarence D Selby, Detroit, Dr Haven Emerson, New York, and Dr Joseph W Mountin, Washington, D C, delegate, Dr Stanley H Osborn, Hartford, Conn, alternate, Dr L D Bristol, New York, chairman, Committee on Section Exhibit, Dr Paul Arthur Davis, Akron, Ohio

Dr Stanley H Osborn, Hartford, Conn, made the report of the section delegate to the House of Delegates Dr Joseph W Mountin, Washington, D C, moved, and the motion was seconded by Dr Clarence D Selby, Detroit, that it be recorded that it is the belief of the section that the rights and privileges of section delegates should not be abrogated

Dr R S Goodhart, Forest Hills, N Y, read a paper on "Nutrition in Industry" Discussed by Dr Norman H Jolliffe, New York

Dr Paul E Howe, Washington, D C, read a paper on "Nutritional Aspects of Feeding an Army" Discussed by Drs Joseph W Mountin, Washington, D C, J D Leake, Washington, D C, and Paul E Howe, Washington, D C

Dr E W Brown, Washington, D C, read a paper on "Nutritional Aspects of Feeding in the U S Navy" Discussed by Dr Paul E Howe, Washington, D C

Dr Howard W Haggard, New Haven, Conn, read a paper on "Supplementary Feeding in Industry" Discussed by Drs C F Yeager, Bridgeport, Conn, J D Leake, Washington, D C, and Paul E Howe, Washington, D C

#### SECTION ON UROLOGY

#### WEDNESDAY, JUNE 10—AFTERNOON

The meeting was called to order at 2 10 by the chairman, Dr Vincent J O'Connor, Chicago

Dr A E Goldstein, Baltimore, read a paper on "Pathologic Conditions Encountered in Horseshoe Kidney" Discussed by Drs Henry Sangree, Philadelphia, Victor D Lespinasse, Chicago, and A E Goldstein, Baltimore A motion picture was shown by Dr Franklin Farman, Los Angeles

Dr W Calhoun Stirling, Washington, D C, read a paper on "Resection of Kidney" Discussed by Drs George C Prather, Boston, Meredith F Campbell, New York, and W Calhoun Stirling, Washington, D C

Dr Herman L Kretschmer, Chicago, read a paper on "Late After Nephrectomy" Discussed by Drs Monroe E Greninger, New York, Stanley R Woodruff, Jersey City, N J, and Herman L Kretschmer, Chicago

Dr Hugh J Jewett, Baltimore, read a paper on "Does Vitamin A Deficiency Exist in Clinical Urolithiasis? Studies Based on Clinical and Pathologic Material" Discussed by Drs David M Davis, Philadelphia, Rubin Flocks, Iowa City, and Hugh J Jewett, Baltimore

Drs A I Folsom and H A O'Brien, Dallas, Texas, presented a paper on "The Female Obstructing Prostate" Discussed by Drs Nelse F Ockerblad, Kansas City, Mo, Reed M Nesbit, Ann Arbor, Mich, Herman L Kretschmer, Chicago, Vincent J O'Connor, Chicago, and A I Folsom, Dallas, Texas

Dr W E Forsythe Jr, New York, read a paper on "The Urethrogram as an Aid in Diagnosis of Prostatic Abscess" Discussed by Drs Roy B Henline, New York, H C Bumpus Jr, Pasadena, Calif, and W E Forsythe Jr, New York

#### THURSDAY, JUNE 11—AFTERNOON

Dr Vincent J O'Connor, Chicago, read the chairman's address entitled "Indications and Prognosis in Unilateral Nephrectomy"

Dr Jorge Cavellier, Bogota, Colombia, read a paper entitled "Syphilis of the Bladder"

Drs Oswald S Lowsley and Edward M Cannon, New York, presented a paper entitled "Aneurysm of the Renal Artery" Discussed by Drs Herbert H Howard, Boston, O A Nelson, Seattle, Victor D Lespinasse, Chicago, and Oswald S Lowsley, New York

Dr B S Barringer, New York, read a paper on "Five Year Results of Carcinoma of the Bladder Treated by Radical Prostatectomy" Discussed by Drs George G Smith, Brookline, Mass, and B S Barringer, New York

Dr F M Allen, New York, read a paper on "Pathologic Vascular Disorders Experimental and Therapeutic Demonstrations" Discussed by Drs Arthur D Munger, Lincoln, Neb, and F M Allen, New York

#### FRIDAY—JUNE 12

Dr Grayson L Carroll, St Louis, read the report of the American Urology, Inc On motion regularly made and seconded report was received

The following officers were elected chairman, Dr J Thompson, Rochester, Minn, vice chairman, Dr Arthur D Munger, Lincoln, Neb, secretary, Dr Grayson L Carroll, St Louis

The resignation of Dr H C Bumpus Jr, Pasadena, Calif, delegate was accepted and Dr Roy B Henline New York, was elected to fill his unexpired term

The following papers were read as a symposium on "Treatment of Carcinoma of the Prostate Gland"

Dr Gershom J Thompson Rochester, Minn "Transurethral Resection of the Malignant Prostate Gland"

Dr William P Herbst, Washington D C "A Preliminary Report of Biochemical Therapeutics in Carcinoma of the Prostate Gland"

Dr Alexander B Gutman, New York "The Serum Acid Phosphatase in Prostate Gland Carcinoma"

Dr Edwin P Aley, Durham N C "Castration for Carcinoma of the Prostate Gland"

Dr Charles D Creery, Minneapolis "The Diagnosis and Treatment of Carcinoma of the Prostate Gland"

Dr Reed M Nesbit and Robert H Cummings Ann Arbor, Mich "Orchiectomy in Treatment of Prostatic Carcinoma A Report of Seventy-Five Cases Followed Six Months or More After Operation"

These six papers were discussed by Drs Arbor D Munger Lincoln Neb H C Bumpus Jr, Pasadena Calif, Walter M Kearns, Milwaukee, Clyde W Collings Pasadena, Calif, Vincent Vermooten, New Haven Conn William P Herbst Washington D C, Charles D Creery, Minneapolis and Reed M Nesbit Ann Arbor Mich

Dr Elmer Hess, Erie, Pa showed a motion picture of his castration operation

## SECTION ON RADIOLOGY

WEDNESDAY, JUNE 10—MORNING

The meeting was called to order at 9 15 by the chairman Dr Ralph S Bromer, Bryn Mawr, Pa

Dr Israel Steinberg, New York read a paper on "The Value of Contrast Roentgenography of the Cardiovascular Structures in the Differentiation of Mediastinal Tumor and Aneurysm"

Dr O A Nelson, Seattle, read a paper on "Arteriography for Renoabdominal Diagnosis"

Drs Henry K Taylor and Teresa McGovern New York, presented a paper on "Evaluation of Angiocardiography"

These three papers were discussed by Drs M F Steinberg, New York, Merrill C Sossman, Boston O A Nelson, Seattle, and Henry K Taylor, New York

Dr Ralph S Bromer, Bryn Mawr Pa read the chairman's address, entitled "The Role of the Roentgenologist in the Diagnosis of Congenital Cardiac Lesions"

Drs Marc L Sussman and Emanuel Wachtel New York, presented a paper on "Factors Concerned in the Abnormal Distribution of Barium in the Small Bowel"

THURSDAY JUNE 11—MORNING

The following officers were elected chairman, Dr Robert A Arens Chicago vice chairman Dr Edwin C Ernst, St Louis secretary Dr John T Murphy, Toledo, Ohio, executive committee Dr Raymond C Beeler Indianapolis, Dr Ralph S Bromer Bryn Mawr, Pa, and Dr Robert A Arens, Chicago, delegate Dr Edward H Skinner Kansas City, Mo alternate, Dr E P Pendergrass, Philadelphia, delegate to American Board of Radiology, Dr Lyle C Kinney, San Diego Calif

Dr Karl Kornblum Philadelphia, read a paper entitled "A Plea for the Prevention of Bronchiectasis" Discussed by Drs John T Farrell Jr Philadelphia, Louis H Clerf, Philadelphia, and Karl Kornblum, Philadelphia

Drs Geza de Takats, G K Fenn and Edward L Jenkinson Chicago presented a paper on "Bronchial Obstruction in Pulmonary Embolism" Discussed by Drs Louis H Clerf, Philadelphia, and G K Fenn Chicago

Drs Roscoe W Teahan Hoke Wammoth and James L Weatherman, Philadelphia, presented a paper on "Treatment of Carcinoma of the Cervix by Interstitial Radiation" Discussed

by Drs A N Arneson, St Louis, John J Gilbride Philadelphia, Misch Casper, Louisville, Ky, and Roscoe W Teahan, Philadelphia

Dr Milton Friedman New York read a paper on "Insertion of Radium into the Uterus and Vagina" Discussed by Drs Edith H Quimby, New York Charles L Martin, Dallas, Texas, and Milton Friedman, New York

Drs J Dewey Bisgard, Howard B Hunt and Orvis A Neely, Omaha, presented a paper on "Experimental Studies of the Mechanism of Action of Roentgen Therapy on Infection" Discussed by Drs James F Kelly, Omaha John S Lockwood, Philadelphia, and J Dewey Bisgard, Omaha

FRIDAY, JUNE 12—MORNING

A joint meeting was held with the Section on Obstetrics and Gynecology

Dr Willard M Allen St Louis read a paper on "Excessive Menstrual Bleeding in Adolescent Girls"

Dr Ira I Kaplan, New York, read a paper on "Splenic and Pituitary Irradiation for the Control of Puberal Bleeding"

Dr Clarence Cook Little Bar Harbor Maine read a paper on "The Effect of Radiation on Germ Cells"

Dr Conrad G Collins, New Orleans read a paper on "Excessive Bleeding at the Menopause or Associated with Myoma"

In the absence of two members of the executive committee, Dr N W Furey Gaylord Mich, and Dr Joseph England Roberts Jr, Camden, N J, were appointed temporary members

These four papers were discussed by Drs V S Counseller, Rochester, Minn, Lewis C Scheffey Philadelphia Ramsay Spillman New York, George H Gardner Chicago Richard W TeLinde, Baltimore, John T Murphy, Toledo Ohio, Willard M Allen, St Louis Ira I Kaplan, New York Clarence Cook Little, Bar Harbor Maine and Conrad G Collins, New Orleans

## SECTION ON GASTRO-ENTEROLOGY AND PROCTOLOGY

WEDNESDAY, JUNE 10—MORNING

The meeting was called to order at 9 o'clock by the chairman, Dr Walter L Palmer, Chicago

Drs A J Atkinson, H F Adler and A C Ivy, Chicago presented a paper on "Motility of the Human Colon The Normal Pattern Dyskinesia and Effect of Drugs" Discussed by Drs Walter C Alvarez, Rochester Minn John P Quigley Cleveland James W Wiltzie, Binghamton N Y and A J Atkinson Chicago

Drs Malcolm R Hill Los Angeles E Harold Shroock, Loma Linda, Calif, and F George ReBell, Los Angeles, presented a paper on "The Role of the Anal Glands in the Pathogenesis of Anorectal Disease" Discussed by Drs Robert A Scarborough San Francisco Claude C Tucker Wichita, Kan, and Malcolm R Hill Los Angeles

Dr Thomas E Smith, Dallas, Texas read a paper on "Primary Lymphoid Tumors of the Rectum Resembling Internal Hemorrhoids" Discussed by Drs Curtice Rosser, Dallas, Texas Simon B Kleiner New Haven, Conn Claude C Tucker, Wichita Kan, and Thomas E Smith, Dallas, Texas

Dr C C Mechling Pittsburgh read a paper on "Anesthesia Used in Proctology" Discussed by Drs Louis J Hirschman, Detroit, John J Corbett, Detroit, Curtice J Rosser, Dallas, Texas, and C C Mechling Pittsburgh

Drs W Wayne Babcock and Harry E Bacon, Philadelphia, presented a paper on "Operative Treatment of Cancer of the Rectum and Sigmoid Without Colostomy" Discussed by Drs Louis J Hirschman Detroit Frank H Laher, Boston and W Wayne Babcock Philadelphia

Dr Joseph Felsen New York, read a paper on "The Infectious Diarrheas, Enteritis and Colitis"

Drs Z Bercovitz and R C Page, New York, presented a paper on "Metabolic and Vitamin Studies in Chronic Ulcerative Colitis"

These two papers were discussed by Drs J A Barga, Rochester, Minn, Manfred Kraemer, Newark, N J, A Trasoff, Philadelphia, Moses Paulson, Baltimore, Joseph Felsen, New York, and Z Bercovitz, New York

Dr E Parker Hayden, Boston, read a paper on "Inflammatory Stenosing Lesions of the Colon"

Dr Raymond J Jackman, Rochester, Minn, read a paper on "Diverticula of the Colon Proctoscopy as an Aid in the Diagnosis and Differential Diagnosis" Discussed by Drs Johannes Pessel, Trenton, N J, John C M Brust, Syracuse, N Y, Louis A Buie, Rochester, Minn, and Raymond J Jackman, Rochester, Minn

#### THURSDAY, JUNE 11—MORNING

Dr A F R Andresen, Brooklyn, reported for the committee appointed in 1940 to cooperate with the American Board of Internal Medicine in the certification of specialists in gastroenterology. He stated that any one interested in being certified in internal medicine and gastroenterology should write to Dr William S Middleton, 1301 University Avenue, Madison, Wis, for information

Dr Andresen read the following resolution and moved its adoption

WHEREAS, At a special meeting of the American Board of Internal Medicine on June 4, 1942 the board, in an effort to avoid the appearance of a monopoly, unanimously agreed to invite the Section on Gastroenterology and Proctology to nominate a panel of five of its members from whom the board might choose one representative of the section on its Advisory Committee on Gastroenterology, therefore be it

Resolved, That the executive committee of the section, acting as a nominating committee, be asked to present five names for such a panel, to be elected by the section at its regular meeting on June 12, 1942

Dr John L Kantor, New York, seconded the motion, which was put to a vote and was carried

Dr Louis A Buie, Rochester, Minn, made a report as the section's delegate to the House of Delegates, reading the Report of the Judicial Council to the members of the House of Delegates at its meeting Monday morning, June 8, 1942 and stating that this report was referred to the Committee on Sections and Section Work, and that thus far that committee had not made a report to the House of Delegates

Dr A H Aaron, Buffalo, moved, and Dr John L Kantor, New York, seconded, that the section approve Dr Buie's report, and that it be recorded as the sense of the section that the present privileges of sectional delegates should not be abrogated. The motion was put to a vote and was carried

The following officers were elected: chairman, Dr Emmett H Terrell, Richmond, Va, vice chairman, Dr J Arnold Barga, Rochester, Minn, secretary, Dr Sara M Jordan, Boston, executive committee: Dr Frank C Yeomans, New York, Dr Walter L Palmer, Chicago, and Dr Emmett H Terrell, Richmond, Va, alternate delegate, Dr Walter A Fansler, Minneapolis, chairman of Scientific Exhibit Committee, Dr Grant H Laing, Chicago, member of Certifying Committee, Board of Proctology, Dr Frank G Runyeon, Reading, Pa, five names to be submitted to the Board of Internal Medicine, from whom one is to be chosen to represent the section on the Certifying Board for Gastroenterology: Dr Anthony Bassler, New York, Dr Reuben Finkelstein, Brooklyn, Dr John H Fitzgibbon, Portland, Ore, Dr Walter L Palmer, Chicago, and Dr Adolph Sachs, Omaha

Dr Walter L Palmer, Chicago, read the chairman's address, entitled "The Stomach and Military Service"

Dr John L Kantor, New York, read a paper on "Digestive Disease and Military Service, with Special Reference to the Medical Department of the United States Army" Discussed by Drs C R Reynolds, Harrisburg, Pa, Donald T Chamberlin, Atlanta, Ga, Henry M Thomas Jr, Fort George G Meade, Maryland, J Edward Berk, Fort Dix, New Jersey, Rudolf

Schindler, Chicago, Hyman I Goldstein, Camden, N J, and John L Kantor, New York

The following papers were read in a Panel Discussion of Ulcer, during which Dr A H Aaron, Buffalo, presided

Dr B R Kirklin, Rochester, Minn "Ulcerating Lesions of the Stomach"

Dr Jacob Earl Thomas, Philadelphia "The Modern Conception of Gastric Secretion"

Drs Samuel Morrison and Maurice Feldman, Baltimore "Psychomatic Correlations of Duodenal Ulcer: A Statistical Study"

Drs Harry Shay, J Gershon-Cohen and Samuel S Feldman, Philadelphia "The Physiologic Basis for the Dietotherapy of Duodenal Ulcer"

Drs Asher Winkelstein, Albert Cornell and Franklin Hollander, New York "An Evaluation of the Continuous Intragastric Drip Therapy"

Dr John M Blackford, Seattle "Fatal Hemorrhage from Peptic Ulcer"

Drs Jacob Meyer and Heinrich Necheles, Chicago "A Critical Evaluation of the Factor of Age in the Conservative and Surgical Treatment of Bleeding Peptic Ulcer"

Dr V C Rowland, Cleveland "Treatment of Obstructive Juxtapyloric Ulcer: Combined Use of Aluminium Hydroxide Drip and Wangenstein Aspirator"

Drs J William Hinton, New York "The Selection of Operation for Patients with Gastric and Duodenal Ulcers"

Dr Everett D Kiefer, Boston "Jejunal Ulcers and Recurrent Hemorrhages After Partial and Subtotal Gastrectomy for Peptic Ulcer"

A question period followed these presentations

#### FRIDAY, JUNE 12—MORNING

A joint meeting was held with the Section on Pathology and Physiology

The following papers were read in a symposium on "Liver" during which Dr J P Simonds, Chicago, presided

Dr Frank C Mann, Rochester, Minn "The Gastrointestinal Tract and the Liver"

Dr John G Mateer, Detroit "Liver Function Tests"

Drs Thomas A Johnson and Henry L Bockus, Philadelphia "The Significance of Mild Hyperbilirubinemia in Gastrointestinal Patients"

Dr Sidney A Portis, Chicago "The Clinical Prevention and Diagnosis of Liver Dysfunction"

Dr Virgil H Moon, Philadelphia "The Histogenesis of Hepatic Cirrhosis"

Drs Dwight L Wilbur, David A Wood and Forrest J Willett, San Francisco "Primary Carcinoma of the Liver"

Dr Charles Gordon Heyd, New York "The Concept of Liver Deaths"

These seven papers were discussed by Drs Chester M Jaffe, Boston, J P Simonds, Chicago, Henry A Rafsky, New York, Moses Paulson, Baltimore, Frank C Mann, Rochester, Minn, John G Mateer, Detroit, Thomas A Johnson, Philadelphia, Sidney A Portis, Chicago, Dwight L Wilbur, San Francisco, and Virgil H Moon, Philadelphia

The following papers were read in a symposium on "Gastritis," during which Dr Walter L Palmer, Chicago, presided

Dr Edward B Benedict, Boston "Correlation of Gross and Pathologic Findings in Gastritis"

Dr Julian M Ruffin, Durham, N C "The Size of Hemorrhagic or Pigment Spots as Observed by Gastric Endoscopy"

Dr C Wilmer Wirts, Philadelphia "The Early Stages of Carcinoma of the Stomach"

Drs I R Jankelson and C W McClure, Boston "The Relation of Atrophic Gastritis to Carcinoma of the Stomach"

Drs J B Carey and R S Ylvisaker Minneapolis "Gastroscopic Observation in Duodenal Ulcer"

These five papers were discussed by Drs Shields Warren Boston Rudolf Schindler, Chicago Leonidas H Berry Chicago Leo L J Hardt, Chicago Henry A Rafsky New York A A Goldsmith Chicago James Patejdl Chicago, Edward B Benedict Boston, Julian M Ruffin Durham N C, I R Jankelson Boston and J B Carey Minneapolis

## SECTION ON ANESTHESIOLOGY

WEDNESDAY, JUNE 10—AFTERNOON

The meeting was called to order at 2 o'clock by the chairman, Dr Thomas J Collier Atlanta Ga

Dr Thomas J Collier Atlanta Ga read the chairman's address entitled Crawford W Long 1815 1878

Dr E M Papper New York read a paper on 'Circulatory Changes During Spinal Anesthesia' Discussed by Drs Sidney C Wiggan Boston, Stuart C Cullen Iowa City Henry K Beecher Boston and E M Papper New York

Dr Leo V Hand Boston read a paper on 'Spinal Anesthesia Factors Influencing Its Success' Discussed by Drs Rolland J Whitacre East Cleveland Ohio Virginia Apgar, New York F Elmore Hubbard Montclair N J, George C Moore Boston and Leo V Hand, Boston

Dr Paul M Wood New York read a paper on 'Rectal Anesthesia in Surgical and Obstetric Procedures' Discussed by Drs Wesley Bourne, Westmount Que H Boyd Stewart Tulsa Okla John H Hutton Portland Ore, and Paul M Wood New York

Dr Franklin F Snyder, Chicago, read a paper on "Morphine in Obstetric Analgesia" Discussed by Drs Douglas P Murphy Philadelphia Newlin F Paxon Philadelphia David I Macht, Baltimore and Franklin F Snyder Chicago

THURSDAY, JUNE 11—AFTERNOON

Dr Wesley Bourne Westmount Que read a paper on "Interdependence of Function in Anesthesia" Discussed by Drs Ralph M Waters Madison Wis Ralph M Tovell Hartford, Conn and Wesley Bourne, Westmount Que

Drs H F Bishop, Washington, D C and Fred F Rudder Atlanta Ga, presented a paper on "Intravenous Anesthesia" Discussed by Drs J Roy Fulton, Philadelphia, Robert A Hingson Stapleton Staten Island, N Y Fred F Rudder, Atlanta Ga and H F Bishop Washington D C

Dr Douglas B Kendrick Jr Washington D C read a paper on 'The Prevention and Treatment of Shock During Surgical Procedures' Discussed by Drs Henry K Beecher, Boston and Douglas B Kendrick Washington D C

Dr Stevens J Martin Fort Dix New Jersey read a paper on 'The Teaching of Anesthesiology in the Army' Discussed by Drs Henry S Ruth Merion Station Pa Sidney C Wiggan, Boston and Stevens J Martin Fort Dix New Jersey

Dr K C McCarthy, Toledo Ohio read a paper on 'Casualty Anesthesia in England' Discussed by Drs A L Tynes, Washington D C S LeRoy Sahler, Rochester N Y, and K. C McCarthy Toledo, Ohio

FRIDAY, JUNE 12—AFTERNOON

Dr Henry S Ruth, Merion Station Pa delegate to the House of Delegates presented his report

The Secretary Dr John S Lundy, Rochester Minn, read a communication from the American Board of Anesthesiology containing an amendment to section 2 article III, of the constitution of the board On motion of Dr Ralph M Waters, Madison Wis seconded by Dr Paul M Wood New York the amendment was adopted as read approving the change from three to four representatives on the board

Dr Henry S Ruth, Merion Station Pa and Dr Paul M Wood, New York were elected delegates to the American Board of Anesthesiology for a period of six years

The secretary read a communication from Dr Paul M Wood New York American Board of Anesthesiology, requesting that the Section on Anesthesiology of the American Medical Association urge the inclusion of one or more anesthetists on the Council on Pharmacy and Chemistry of the American Medical Association It was moved by Dr Henry S Ruth, Merion Station Pa seconded by Dr M H Krakow New York, and voted that the section support Dr Wood's suggestion

The following officers were elected chairman Dr Paul M Wood New York, vice chairman Dr William Wilson Hutchinson Los Angeles secretary, Dr John S Lundy, Rochester Minn executive committee Dr Ralph M Waters, Madison Wis Dr Thomas J Collier Atlanta Ga, and Dr Paul M Wood New York delegate Dr Henry S Ruth, Merion Station Pa alternate Dr C F McCuskey Los Angeles

Dr C L Burstein New York read a paper on "Laboratory and Clinical Studies with Paraldehyde" Discussed by Drs Ralph T Knight, Minneapolis and C L Burstein New York

Dr Robert D Dripps Jr Philadelphia read a paper on "The Balance Between Central and Reflex Control of Respiration" Discussed by Drs Carl F Schmidt Philadelphia F Elmore Hubbard Montclair N J, and Robert D Dripps Jr, Philadelphia

Drs Herbert W Schmidt and Lloyd H Mousel Rochester Minn presented a paper on 'Postoperative Bronchoscopy' Discussed by Drs Philip D Woodbridge, New Haven, Conn Alfred Habeeb Fairfield Ala Leo V Hand, Boston and Herbert W Schmidt Rochester, Minn

Dr John Adriani New Orleans, read a paper on 'Effect of Anesthetics on Bronchial Tissues' Discussed by Drs Donald E Brace Woodside, N Y, Douglass H Batten, Brooklyn, and John Adriani, New Orleans

Dr Richard von Foregger Jr Madison, Wis, read a paper on 'Surface Temperature Under Anesthesia'

## SECTION ON MISCELLANEOUS TOPICS

Sessions on General Practice

WEDNESDAY, JUNE 10—MORNING

The first session on General Practice was called to order at 9 05 by the chairman, Dr Lucien Stark, Norfolk Neb

Dr Lucien Stark, Norfolk Neb, read the chairman's address

Dr George M Cook Hammond Ind read a paper on 'Cardiology in General Practice'

Dr Tinsley R Harrison Winston-Salem, N C, read a paper on "Some Puzzling Aspects of Pain in the Chest" Discussed by Drs Ferdinand F Schwartz, Painesville Ohio, Henry M Thomas Jr Fort George G Meade Maryland, Wingate M Johnson Winston-Salem N C, Clark W Day, Indianapolis Emilio Leopold Hergert Brooklyn F M Pottenger Monrovia Calif, Meyer Golob New York and Tinsley R Harrison Winston-Salem N C

Dr H W Rathe Waverly, Iowa, read a paper on "Myocardial Infarction Clinical Features and Prognosis" Discussed by Drs Horace M Kornis Iowa City, and O P J Falk, St Louis

Dr Hugh P Greeley Madison Wis, read a paper on "Blood Pressure After Thirty Years" Discussed by Dr Karl H Doege, Marshfield, Wis

Dr J J Eller New York, read a paper on 'Vitamins in Dermatology, Including Gray Hair Therapy' Discussed by Drs Carroll S Wright, Philadelphia Benjamin F Sieve, Boston, Paul Gross, New York Arthur D Woods State Center Iowa Abraham E Jaffin Jersey City N J and J J Eller New York

## THURSDAY, JUNE 11—MORNING

Dr Arch Walls, Detroit, read a paper on "Menopausal Symptoms and Their Treatment" Discussed by Drs William J Carrington, Atlantic City, N J, A R Abarbanel, Baltimore, and Arch Walls, Detroit

Dr Elliott B Edie, Uniontown, Pa, read a paper on "The Management of Patients with Anxiety" Discussed by Drs Edward Weiss, Philadelphia, Belle E Jacobson, New Rochelle, N Y, and Joseph A Pettit, Portland, Ore

Dr Walter C Alvarez, Rochester, Minn, read a paper on "What Causes Gas?" Discussed by Drs Burrill B Crohn, New York, Edward Weiss, Philadelphia, James M Northington, Charlotte, N C, and Walter C Alvarez, Rochester, Minn

Dr C W McGavran, Columbus, Ohio, read a paper on "The So-Called Mucous Colitis or Spastic Irritable Colon" Discussed by Drs Walter C Alvarez, Rochester, Minn, William Cole Davis, Atlantic City, N J, Myer Solis-Cohen, Philadelphia, and C W McGavran, Columbus, Ohio

Dr M W Thewlis, Wakefield, R I, read a paper on "The Care of the Aged" Discussed by Drs Lucien Stark, Norfolk, Neb, Wingate M Johnson, Winston-Salem, N C, George M Levitas, Westwood, N J, and M W Thewlis, Wakefield, R I

Dr C T Stone, Galveston, Texas, read a paper on "The Modern Treatment of Pneumonia" Discussed by Dr George M Piersol, Philadelphia

## Session on Legal Medicine

## FRIDAY, JUNE 12—MORNING

The meeting was called to order at 9 17 by the chairman, Dr William C Woodward, Washington, D C

Dr Edmund M Morgan, Cambridge, Mass, read a paper on "Privileged Communications Law versus Ethics"

Dr Hubert W Smith, Cambridge, Mass, read a paper on "Legal Responsibility for Negligent Diagnosis"

Dr Raimundo de Castro, Havana, Cuba, read a paper on "Human Postmortem Changes in the Tropics and Their Medico-legal Significance"

Dr Harrison S Martland, Newark, N J, read a paper on "The Importance of Performing Autopsies on the Bodies of Persons Apparently Dead by Suicide" Discussed by Dr Alan R Moritz, Boston

Dr Samuel R Gerber, Cleveland, read a paper on "The Advantage of the Coroner System Over That of the Medical Examiner"

Dr Timothy Leary, Boston, read a paper on "The Advantage of the Medical Examiner System Over That of the Coroner"

These two papers were discussed by Drs Haven Emerson, New York, Theodore J Corphey, Garden City, N Y, L M Snyder, Lansing, Mich, Alfred Angrist, Jamaica, Long Island, N Y, Hubert Winston Smith, Cambridge, Mass, Samuel R Gerber, Cleveland, and Timothy Leary, Boston

## SECTION ON ORTHOPEDIC SURGERY

## WEDNESDAY, JUNE 10—AFTERNOON

The meeting was called to order at 2 o'clock by the chairman, Dr James A Dickson, Cleveland

Dr John G Kuhns, Boston, read a paper on "Congenital Flat Foot" Discussed by Drs Paul W Lapidus, New York, Guy A Caldwell, New Orleans, and John G Kuhns, Boston

Dr C Glenn Barber, Cleveland, read a paper on "Osteochondrosis Deformans Tibiae A Type of Developing Non-rachitic Bowlegs in Children" Discussed by Drs Luthero Vargas, Rio de Janeiro, Brazil, Walter P Blount, Milwaukee, H A Swart, Charleston, W Va, I William Nachlas, Baltimore, and C Glenn Barber, Cleveland

Dr Allan D Wallis, Philadelphia, read a paper on "Odor in the Orr Treatment of Osteomyelitis and Its Prevention by Lactose" Discussed by Drs Fritz Teal Jr, Lincoln, Neb, Lenox D Baker, Durham, N C, and Allan D Wallis, Philadelphia

The following nominating committee was appointed chairman, Robert D Schrock, Omaha, Vernon P Thompson, Los Angeles, and John G Kuhns, Boston

Dr Alberto Inclan, Havana, Cuba, read a paper on "Tumoral Calcinosi" Discussed by Drs Robert D Schrock, Omaha, Ralph K Ghormley, Rochester, Minn, and Alberto Inclan, Havana, Cuba

Dr A Bruce Gill, Philadelphia, read a paper on "Suggestions for Improvements in the Program for the Public Care of the Crippled Child" Discussed by Dr Allen F Voshell, Baltimore

Dr Earl D McBride, Oklahoma City, read a paper on "Plated Osteoperiosteal Graft" Discussed by Drs Leo S Lucas, Portland, Ore, Rexford L Diveley, Kansas City, Mo, and Earl D McBride, Oklahoma City

## THURSDAY, JUNE 11—AFTERNOON

The following officers were elected chairman, Guy A Caldwell, New Orleans, vice chairman, Theodore A Will, Cleveland, secretary, Francis M McKeever, Los Angeles, executive committee J Albert Key, St Louis, James A Dickson, Cleveland, and Guy A Caldwell, New Orleans, suggestions to American Board of Orthopedic Surgery (1) Ralph K Ghormley, Rochester, Minn, (2) Robert W Johnson, Baltimore, delegate, James Archer O'Reilly, St Louis, alternate, J E M Thomson, Lincoln, Neb

Dr James Archer O'Reilly, St Louis, gave a report as delegate to the House of Delegates

On motion by Dr Rexford L Diveley, Kansas City, Mo, it was voted that a committee be formed to study and evaluate the Kenny treatment of infantile paralysis, this committee to be composed of six members, two to be appointed by the chairman of the Section on Orthopedic Surgery of the American Medical Association, two members to be appointed by the president of the Academy of Orthopedic Surgeons and two members to be appointed by the president of the American Orthopedic Association, this committee to study and evaluate the Kenny treatment of infantile paralysis, the report to be published either in *THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION* or the *Journal of Bone and Joint Surgery*, and the respective members to report to their respective organizations as soon as is practical and possible

Dr C E Irwin, Warm Springs, Ga, read a paper on "Genus Recurvatum Following Poliomyelitis A Controlled Method of Operative Correction" Discussed by Drs Harold B Boyd, Memphis, Tenn, A Bruce Gill, Philadelphia, H R McCarroll, St Louis, and C E Irwin, Warm Springs, Ga

Dr James A Dickson, Cleveland, read the chairman's address, entitled "Orthopedic Surgery Between Two Wars"

Dr C Howard Hatcher, Chicago, read a paper on "Localized Fibrous Lesions of the Long Bones" Discussed by Dr Robert D Schrock, Omaha, Henry L Jaffe, New York, and C Howard Hatcher, Chicago

Dr Norman T Kirk, Washington, D C, read a paper on "Amputations in War" Discussed by Drs Vernon P Thompson, Los Angeles, Lyman W Crossman, New York, and W Ryerson, Chicago, and Norman T Kirk, Washington, D C

Dr Perrin H Long, Baltimore, read a paper on "Systemic and Local Sulfonamide Therapy of War Wounds" Discussed by Drs John E Cannaday, Charleston, W Va, Philip Le, Chicago, and Perrin H Long, Baltimore

Dr J A MacFarlane, Toronto, Ont, read a paper on "Management of Wounds of the Extremities in Modern Warfare"

Dr Fowler B Roberts, Akron, Ohio, read a paper on "Operation for Dislocated Hips Especially Useful in Young Children" Discussed by Drs David M Bosworth, New York, and Fowler B Roberts, Akron, Ohio

## FRIDAY, JUNE 12—MORNING

A joint meeting was held with the Section on Nervous and Mental Diseases The proceedings are reported in the report of that section

## Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST SUCH AS RELATE TO SOCIETY ACTIVITIES NEW HOSPITALS EDUCATION AND PUBLIC HEALTH)

### ALABAMA

**State Medical Election**—Dr Harvey B Searcy, Tuscaloosa, was elected president of the Medical Association of the State of Alabama at its recent annual session succeeding Dr James M Mason Birmingham. Dr James O Morgan, Gadsden, was elected vice president from the northeastern area.

**Society News**—The northwestern division of the state medical association was addressed in Haleyville May 27 by the following: Drs James S McLester, Birmingham "Nutrition and Fighting the War", Courtney W Shropshire, Birmingham "Rapid Treatment of Early Syphilis with Multiple Injections of Mapharsen", John E Garrison, Birmingham, "Delivering Babies at Home", Lieut Col George A O Connell, Fort McClellan Anniston "Hospitals in the Zone of the Interior" and Major Gerald G Woodruff, Fort McClellan, "Need for Doctors in the Medical Corps".

### CALIFORNIA

**Dr Reed Joins Stanford Faculty**—Dr Alfred C Reed since 1928 professor of tropical medicine University of California Medical School San Francisco has resigned to become associate clinical professor of medicine at Stanford University School of Medicine, San Francisco according to *Science*. Dr Reed served on the Stanford faculty from 1916 to 1928. A graduate of New York University College of Medicine New York, class of 1910 he has specialized in tropical medicine for many years. He was president of the American Society for Tropical Medicine in 1938.

**Increase in Births**—The state department of health reports that 125,050 births were registered in 1941 as compared with 111,840 in 1940. All counties of the state contributed to the increase with the exception of Alpine, Amador, Humboldt, Imperial, Madera, Mariposa, Mono, Nevada, Sutter, Tuolumne, Tehama and Yuba. Most of these counties with low birth rates are located in the mountains and in agricultural regions. Increases are conspicuous in areas where the war industries are located. In 1941 the number of white births was 105,634, 84.5 per cent of the total while in 1940 the number of white births was 93,742 or 83.8 per cent of the total. While the number of Mexican births increased last year the percentage of such births to the total represented a decrease from 11.6 per cent in 1940 to 11.1 per cent in 1941. There were 13,849 Mexican births registered in this state last year as compared with 12,983 in 1940. The percentage of Negro and Chinese births remained stationary while Japanese births increased from 1.3 per cent in 1940 to 1.4 per cent in 1941. There were 1,710 Japanese births registered last year.

### CONNECTICUT

**Personal**—Dr John Howard Staub, chief of staff of the Stamford Hospital, Stamford, was guest of honor at a dinner April 9 in recognition of his many years of service to the community. —Dr Lawrence M Tierney has been appointed health officer of West Haven succeeding Dr Eugene N Cozzolino. —Dr Joseph J Smith, Easton, has been named health officer of Easton succeeding Dr William H Coon.

**Crippled Children Clinics**—The new clinic for crippled children was recently opened in Putnam bringing the total of such clinics to seven supervised by the crippled children division of the state department of health. During the four years that the state department has been conducting the crippled children program about two thousand children have been given care at present about a thousand are under active care.

**Court Bans Birth Control**—The Connecticut Supreme Court ruled in a three to two decision on June 2 that it was illegal for a physician to prescribe the use of contraceptives even if he believed a married woman's life might be jeopardized by pregnancy, newspapers reported. It was stated that this is the second time in two years that a court upheld the state's sixty-two year old law making birth control a criminal offense. The case was said to arise from a request for a declaratory judgment by Dr Wilder Tileston, David P Smith, clinical professor of medicine, Yale University School of Medicine, New Haven.

### DISTRICT OF COLUMBIA

**Gibson Award**—Dr Richard W Wilkinson, Washington, was presented with the Frank E Gibson Award at a meeting of the Washington Medical and Surgical Society, May 20 for his "original and outstanding paper on ophthalmology." The prize is given in recognition "of meritorious contributions to medical science" and was established in 1937 in honor of Dr Frank E Gibson, permanent treasurer of the society. Dr Wilkinson graduated at George Washington University School of Medicine in 1928. He is 39 years old.

### GEORGIA

**Personal**—Dr Henry Richmond Slack, La Grange, observed his eightieth birthday May 7. For eight years he was president of the Georgia Pasteur Institute, Atlanta, and once served as secretary and chemist for the state board of pharmacy for twelve years, he served several terms as a member of the Revision Committee of the U S Pharmacopeia. —Dr Wilhel B Trammell, Stratham, has been named health commissioner in the newly established unit in Gwinnett County, with headquarters in Lawrenceville.

**Resolution on Control of Psittacosis**—The Georgia State Board of Health adopted a resolution, April 16, prohibiting the importation, purchase, breeding, giving away, sale or offer of sale of birds of the psittacine family. The resolution further provided that importation and breeding of such birds for scientific research for public zoologic gardens may be permitted subject to the approval of the state health officer. Under the resolution birds of the psittacine family include any parrot, parakeet, lovebird, macaw, cockatoo, lory, lorikeet or any other bird of the parrot or psittacine family not specifically enumerated. Violation of the regulation is a misdemeanor.

### ILLINOIS

**Personal**—Dr Gerry B Dudley, Charleston, has been appointed a member of the board of public health advisers in the state department of public health, succeeding Dr Clifford U Collins, Peoria, chairman who resigned. —S DeWitt Clough, president of Abbott Laboratories, North Chicago, was awarded an honorary degree of doctor of laws by Knox College, Galesburg, May 25. Mr Clough delivered the commencement address on "Research and Readjustment." —Dr Henry W Wood, Sheldon, was presented with an emblem and certificate denoting membership in the fifty year club of the state medical society, June 4 at a meeting of the Iroquois County Medical Society.

**State Board Ruling on Graduates of Foreign Schools**—Graduates of medical colleges in continental Europe and graduates of the extramural colleges of Scotland and Ireland who finished after July 1, 1936 (Switzerland excepted) will not be admitted to Illinois medical examinations according to an announcement from the state department of registration and education. This rule will be in force until a true evaluation of the colleges referred to may be obtained, at which time such nonaccredited foreign colleges will be required to prove to the department that their courses and equipment are in every way equal to American medical colleges accredited by the department of registration and education. Other schools in foreign nations may be recognized under the same terms and conditions as obtained before the rule adopted on Feb 21, 1941. This rule shall supersede all rules heretofore adopted and in conflict therewith but will not be retroactive in the sense that it will affect European graduates who have been issued licenses after examination by the department, even though they graduated after 1936.

**Conference on Exceptional Children**—Governor Green called a conference on exceptional children in Chicago, June 15, under the auspices of the Commission for Handicapped Children. The aims of the conference, the first to be held in the state were to further public understanding of the problems of exceptional children, the resources and facilities available to meet that problem and the needs of such children. Among the speakers on the program were Dr Edward L Compere, Chicago "Services and Facilities Available for the Medical Care and Rehabilitation of Handicapped Children", Mr Rodney H Brandon, Springfield "The Philosophy Underlying the State's Care for Its Exceptional Children", Dr Bert I Beverly, Oak Park "Special Problem of Educable Mentally Handicapped Children," and Irving F Pearson, M S, Springfield, "Current Legislative Proposals for Exceptional Children." At a special meeting during the conference consideration was given to the formation of an Illinois chapter of the International Council for Exceptional Children which has as its purpose the promotion of the education and welfare of exceptional children, the handicapped and the gifted.

## Chicago

**Federal Funds to Fight Venereal Diseases**—The city department of health will receive \$125,000 a year from the federal government to carry on the work against venereal disease.

**City Acts to Curb Venereal Diseases**—The city health department quarantined the Lane Hotel, June 23, in an effort to prevent the spread of syphilis, gonorrhea and other venereal diseases among service men, newspapers reported. The action was the first of its kind in the city since the start of the war. The quarantine sign will be taken down only after department of health officials give the place a clean bill of health, it was stated.

**Immunologist Goes to Institute of Technology**—Dan H. Campbell, Ph.D., assistant professor of immunology, department of bacteriology and parasitology, Division of Biological Sciences, University of Chicago, has accepted an appointment at the California Institute of Technology, Pasadena, as assistant professor of immunochemistry. Dr. Campbell received his degree of doctor of philosophy at the University of Chicago in 1935 and since that time has been a member of the faculty.

## INDIANA

**Personal**—Dr. Raymond M. Borland, Bloomington, has been chosen coroner of Monroe County.—Dr. Homer E. Line, Chubb, has been appointed health officer of Miami County.—Dr. Lyman D. Eaton, Indianapolis, has been named director of the district health unit at Princeton, covering Gibson, Pike, Posey and Warrick counties.

**District Meeting**—The Eleventh Indiana Councilor District Medical Association was addressed in Flora, May 20, by the following: Drs. Lee Palmer, Louisville, Ky., "Progress in Pediatrics", Howard Allison Miller, Marion, "Nonsurgical Treatment of Pelvic Conditions," and James O. Ritchey, Indianapolis, "Nontubercular Lesions of the Chest." Al H. Wynkoop of Lebanon was the banquet speaker.

## IOWA

**Hospital to Sponsor Unit for Kenny Treatment**—Drs. James E. Dyson and Dwight C. Wirtz, Des Moines, are establishing a private hospital pavilion for the treatment of infantile paralysis by the Kenny method under the auspices of the Iowa Lutheran Hospital, Des Moines. The two physicians recently returned from Minneapolis, where they had completed a course on the Kenny system. The local unit will be set up at 714 Parnell Avenue, just east of the Lutheran Hospital.

## LOUISIANA

**Changes in Health Personnel**—Dr. Louis A. Breffell, Marksville, head of the Avoyelles Parish health unit, has been appointed in charge of the Iberia unit with headquarters at New Iberia, succeeding Dr. Christopher L. Mengis, who recently became president of the state board of health.

**Officers of Graduate Assembly**—Dr. Oscar W. Bethea was recently chosen president-elect of the New Orleans Graduate Medical Assembly, and Dr. Henry Theodore Simon was installed as president. Drs. Donovan C. Browne and Beryl I. Burns are vice presidents, Joseph S. D'Antoni, secretary, and William H. Gillentine, treasurer. All are of New Orleans.

## MAINE

**Cancer Program Expanded**—The department of health and welfare under recent legislation was commissioned to make investigations concerning "cancer, the prevention and treatment thereof and the mortality therefrom, and to take such action as it may deem will assist in bringing about a reduction in the mortality thereto." The state medical journal states that the program is now under way in the division of medical services in the bureau of health. Currently the cancer committee of the Maine Medical Association, the Women's Field Army, the tumor clinics in the state and the bureau of health are cooperating in the projection of the plan. At a recent meeting of the cancer committee in the bureau of health, suggestions were formulated for the activities of the various groups participating in the program. Under the new setup the bureau of health will be responsible for compilation of data on cancer incidence. Members of the state cancer committee are Drs. Edward H. Risley, Waterville, Magnus F. Ridlon, Bangor, Bertrand A. Beliveau, Lewiston, Merriwell Tieche Shelton, Augusta, and William Holt, Portland.

## MARYLAND

**Dr. Knox Retires as State Hygienist**—Dr. James Hall Mason Knox Jr., Baltimore, was given a dinner by members of the state department of health May 15 to mark his retirement as chief of the bureau of child hygiene of the department. He has held the position since 1922. Dr. Knox graduated at Johns Hopkins University School of Medicine, Baltimore, in 1898 and has been a member of its faculty since 1909. He has been lecturer in child hygiene at the Johns Hopkins University School of Hygiene and Public Health since 1922. He was president of the American Pediatric Society in 1925, assistant chief, children's bureau, American Red Cross, Paris, France, 1917-1918, and field medical director of the child health activities of the American Red Cross in Europe, 1921-1922. More than one hundred friends, colleagues, nurses and health officers attended the dinner.

## MASSACHUSETTS

**State Society Approves Prepaid Plan for Medical Care**—The Massachusetts Medical Society approved a statewide system of prepaid budgeting for medical care at its meeting in May. Administration of the plan will be through a non-profit corporation called the Massachusetts Medical Service, in whose directorate the lay public, the subscribers and the medical profession will be represented equally, according to the Boston Herald. A state charter was issued on May 27. The plan will first offer a low cost surgical contract designed mainly for the industrial population and the low income group. Besides surgery it will include obstetrics and diagnostic x-ray examination while in the hospital. Later it may be possible to work a complete coverage contract offering medical care in the home, office and hospital. Medical representatives will be Dr. John H. Blaisdell, Boston, James C. McCann, Worcester, Charles E. Mongan, Somerville, Frank R. Ober, Boston, and Samuel A. Robins, Boston.

**Personal**—Dr. Lawrence K. Kelley recently resigned a medical superintendent of the Tewksbury State Hospital and Infirmary, Tewksbury, a position he had held for six years.—Dr. Vlado A. Getting, Boston, has been appointed health commissioner of Worcester.—Dr. Henry D. Chudwick, Waltham, was recently chosen president of the Massachusetts Tuberculosis League.—Dr. Arthur L. Watkins, Boston, was named president of the New England Society of Physical Medicine at its meeting in Arlington, June 3.—Dr. Frederick Fuller Russell, professor of preventive medicine and epidemiology, emeritus, Harvard Medical School, Boston, was awarded the honorary degree of doctor of science by the University of Rochester, Rochester, N. Y., at its annual commencement exercises, May 11.—Dr. Harris Peyton Mosher, Walter Augustus Lecompte professor of otology and professor of laryngology, emeritus, Harvard Medical School, Boston, was awarded the honorary degree of doctor of science on June 5 by Jefferson Medical College of Philadelphia.

## MICHIGAN

**The William J. Mayo Lecture**—The annual William J. Mayo Lecture was delivered in the University Hospital Auditorium, May 22, by Dr. Ralph K. Ghormley, Rochester, Minn. His subject was "A Clinical Pathological Study of Back Pain."

**Personal**—Dr. Stephen S. Skrzycki is the new mayor of Hamtramck.—The staff of Providence Hospital gave a dinner at the Detroit Athletic Club, April 30, to honor Dr. David H. O'Donnell on his completion of fifty years in the practice of medicine.

**Changes in Health Officers**—Dr. Thomas H. Johnston, formerly of Douglas, Ga., has been appointed director of the Ontonagon-Baraga County Health Unit, succeeding Dr. Robert J. Shale, Ontonagon, who has gone to Florida.—Dr. Paul Lindquist, Manistee, has resigned as medical director of the Mason-Manistee-Benzie County Health Unit to accept a position of the new county-city health unit being established in Monroe County.—Dr. Clayton C. Benjamin, Munster, has been appointed in charge of the new county city health unit with headquarters in Ludington.

## MISSOURI

**Health Center and Home of County Society**—A two-story brick building will be constructed at a cost of \$500,000 on the present grounds of the St. Louis County Hospital. Ground breaking ceremonies were held on May 1. New construction is planned to house the administrative and the various divisions of the county health department, a training center. Provision has also been made for the common services and clinics of the health department.

department and for expansion of the hospital outpatient functions. The auditorium wing of the building is planned to provide quarters for the meetings of the St. Louis County Medical Society and the Woman's Auxiliary.

**Dr Hageman Named Director of Laboratories**—The Medical Alumni Quarterly of Washington University announces a series of changes in the laboratories formerly maintained by the school of medicine. Dr. Paul O. Hageman has been appointed director in charge of serology and bacteriology. Dr. Harold A. Bulger of blood chemistry and basal metabolism. Dr. Carl A. Moore of clinical microscopy and Drs. Nathan A. Womack and John E. Hobbs in charge of combined surgical and gynecologic pathology. All are members of the faculty of the school of medicine. This new setup replaces various laboratories on the campus coordinating their activities. On July 1, 1941 Barnes Hospital, St. Louis, assumed the responsibility for the maintenance and direction of the laboratories. Under the new arrangement extensive remodeling of the old service building provides additional accommodations. The entire reorganization will soon be completed.

### MONTANA

**Dr. Armstrong Recovering from Tularemia**—Dr. Charles Armstrong, senior surgeon of the U. S. Public Health Service and director of the Division of Infectious Diseases of the National Institute of Health, Washington, D. C., is convalescing in Hamilton from a severe attack of tularemia, according to the *New York Times*, June 19. He was stricken on May 25 a few hours after his arrival on an official visit to the Rocky Mountain Spotted Fever Laboratory in Hamilton. Since he had not been working on tularemia and was not exposed to it in Hamilton, no one has any idea how he contracted the disease.

### NEW YORK

**Association of Public Health Laboratories**—Dr. Gustavus H. Klinck, Jr., Troy, was chosen president of the New York State Association of Public Health Laboratories at its meeting in Schenectady, May 18. Dr. James S. Taylor, Kingston, was elected vice president and Mary B. Kirkbride, Sc.D., Albany, was reelected secretary-treasurer.

**Personal**—Mrs. Elizabeth M. Finigan, health investigator for institutions, division of communicable diseases, state department of health, retired on May 1 after twenty-nine years' service. Mrs. Finigan was appointed to the department on a part-time basis in 1912, serving in full-time capacity since 1913. One of her achievements during her career as health investigator and lecturer for the state department was a two-year survey of the seven Indiana reservations in the state, which resulted in the establishment of medical and nursing services where the need for them was indicated. —Dr. George P. Berry, professor of bacteriology and assistant dean of the University of Rochester School of Medicine, Rochester, received one of the nine fellowships awarded by the city of Rochester for distinguished service at special ceremonies on May 22.

### New York City

**Private Patients Pavilion at New York Hospital**—The New York Hospital announces the dedication of its pavilion for private patients to take place on September 1, the tenth anniversary of the opening of the present hospital buildings. The unit, comprising six floors and more than a hundred rooms for patients and known as only part of the general hospital, will be named the George F. Baker Pavilion in honor of a late governor of the hospital and his son. The pavilion, with the medical and surgical floors of the New York Hospital, will now form the central unit of the hospital, a part of the Cornell University Medical College Center, becoming one of the six separate services operated by the Society of the New York Hospital. Others in the group are the Lyng-In Hospital, Children's Clinic, Payne Whitney Psychiatric Clinic and the New York Hospital, Westchester division. Mr. Baker and his son made many financial gifts to the hospital.

**Body and Mind Foundation Guilty of Illegal Practice of Medicine**—The Body and Mind Foundation, Inc., was fined \$750 and Rudolph Rebold, research observer in the foundation's clinic, New York, was given a suspended sentence, June 26, after having been found guilty, June 16, of unlawfully practicing medicine according to the *New York Times*. The foundation was found guilty on another of the five original counts in the information—that of illegally displaying a dispensary sign in front of the old garage which is now the home of the foundation. The court also convicted Rebold on the count that he posed as a physician by using 'M.D.' after his name in an

article he wrote in a pamphlet, issued by Dr. Edward S. Cowles, head of the clinic, as well as on Rebold's license plates for several years. The third defendant in the information, Mrs. Eveline Dolm Schulman, tried under the name of Dr. Eveline Dolm, alleged aide to Dr. Cowles in the foundation, was acquitted. During the course of the trial, state witnesses told of paying \$12 or more when being admitted as patients and of Rebold interrogating them on symptoms of illness which they simulated and which he recorded in notes. He admitted on the stand that he passed these notes over to Dr. Cowles when he was about to examine the patient but insisted that he did so merely as a matter of 'professional observations.' Rebold said he was a student for a brief time in a medical school. At one time he was a civilian assistant to the pathologist at Sing Sing prison at necropsies and at another time the biochemist at the Hospital for the Ruptured and Crippled. Dr. Cowles did not appear at the trial but on the day before the trial started, June 5, he appeared for a hearing on disciplinary charges before a subcommittee of the grievance committee of the state education department.

### NORTH CAROLINA

**Dr. Levine Appointed Pathologist**—Dr. Jacob Levine has been appointed head of the pathology department of the city hospital system at Winston-Salem to succeed Dr. Thomas T. Frost, Winston-Salem, who is resigning to go to Indianapolis. The appointment was effective on July 1. Dr. Levine has been pathologist at the Veterans Administration Facility, Aspinwall, Pa., since 1938. He graduated at Syracuse University College of Medicine in 1928.

**District Meeting**—The Tenth District Medical Society met in Asheville on May 27. Included on the program were:

- Dr. Wingle M. Johnson, Winston-Salem: The Nervous Patient.
- Dr. Charles F. Owen, Jr., Canton: Gunshot Wounds of the Abdomen.
- Dr. Charles H. Armentrout, Asheville: Treatment of Congestive Heart Failure.
- Dr. Joseph F. McGowan, Asheville: Internal Diseases of the Eye Seen in General Practice.
- Dr. William A. Hoover, Murphy: Disease Which May Simulate Acute Conditions of the Alder.
- Dr. Allison L. Ormond, Black Mountain: Pleural Shock and Air Embolus in Artificial Pneumothorax.

### OHIO

**Dr. Cummer Receives the Academy Award**—Dr. Clyde L. Cummer, Cleveland, formerly president of the Ohio State Medical Association, has been announced as winner of the 1942 distinguished service award of the Academy of Medicine of Cleveland. Dr. Cummer, who is assistant clinical professor of dermatology and syphilology at Western Reserve University School of Medicine, Cleveland, has been a member of the faculty since 1909. He served as president of the Cleveland Academy in 1923 and is now chairman of the Council on Scientific Assembly of the American Medical Association.

**County Society Observes One Hundredth Anniversary**—The Summit County Medical Society held a dinner dance at the Akron City Club on June 3 to observe the one hundredth anniversary of its founding. An exhibit of records of the society, photographs and war service medals won by members who have been engaged in eleven wars of the United States and foreign countries beginning with the War of 1812, were displayed under the direction of Dr. Alexander S. McCormick, secretary for the last twenty-eight years. The exhibit also included numerous instruments used years ago and some of the instruments invented or designed by members of the society. The Summit County Medical Society was organized in 1842, two years after the establishment of the county, largely through the efforts of Dr. Moses Thompson (1776-1858), who had settled in Hudson and who retired from practice in 1815. The society forced into inactivity during the Civil War, was reorganized in 1866 and again in 1884, 1898 and 1923.

### OKLAHOMA

**Dr. Battenfield to Go to New York**—Dr. John Y. Battenfield, Oklahoma City, director of the division of preventable diseases, Oklahoma Department of Public Health, has been appointed medical associate of the National Society for the Prevention of Blindness. Before joining the headquarters of the society in New York, Dr. Battenfield will serve for several months with a special trachoma project in Oklahoma carried on under the auspices of the national society and the state health department. Dr. Battenfield graduated at the University of Oklahoma School of Medicine, Oklahoma City, in 1937, later receiving the M.P.H. degree at Johns Hopkins University School of Hygiene and Public Health, Baltimore.

## PENNSYLVANIA

**Society News**—Dr Lester Hollander, Pittsburgh, discussed "Afflictions of the Skin and Allied Allergic Conditions" before the Fayette County Medical Society in Uniontown, June 4—Dr Grover C Weil, Pittsburgh, discussed the sulfonamides before the Cambria County Medical Society in Johnstown, June 18

## Philadelphia

**Philadelphia Medicine**—Starting with its June 13 issue, the bulletin of the Philadelphia County Medical Society bears the name of *Philadelphia Medicine*. Known for many years as the *Weekly Roster and Medical Digest*, the bulletin's name last year was changed to *Weekly Roster, Philadelphia Medicine*. Now the name reads *Philadelphia Medicine*.

**New Professor of Anesthesiology**—Dr Philip D Woodbridge, on the staff of the Lahey Clinic, Boston, since 1928, has been appointed professor of anesthesiology at Temple University School of Medicine, effective July 1. Dr Woodbridge graduated at Harvard Medical School, Boston, in 1921. He was president of the New England Society of Anesthesiology in 1934 and 1936 and of the Boston Society of Anesthetists in 1935 and 1937.

**Immunization Campaign**—The Philadelphia Department of Health launched its annual immunization campaign against diphtheria June 1. Temporary stations were opened in eighty-five schools and ten health centers for immunization of children between 9 months and 6 years of age. According to a newspaper report this annual program has reduced deaths from diphtheria in Philadelphia from three hundred and fifteen in 1925 to none in 1940. Three deaths of children who had not been immunized occurred in the city last year.

**Garvan Medal Awarded to Dr Seibert**—Florence B Seibert, Ph D, associate professor of biochemistry, Henry Phipps Institute, has been announced as the winner of the 1942 Francis P Garvan Gold Medal of the American Chemical Society. Presentation will be made at the society's meeting in Buffalo, September 7. Dr Seibert, who isolated the active substances in tuberculin, received her degree in philosophy at Yale University, New Haven, Conn, in 1923. For a time she served on the staff of the University of Chicago, going to the Henry Phipps Institute in 1932. The Garvan Gold Medal is awarded to women in chemistry.

## Pittsburgh

**Personal**—Francis R Holden, Ph D, has been appointed industrial hygienist on the staff of the Industrial Hygiene Foundation at the Mellon Institute, to be in charge of industrial hygiene services of all types. Dr Holden has been specializing in industrial medicine since he received his degree of philosophy at the University of Cincinnati in 1934. For the past year and a half he has been studying natural gas under a fellowship at the institute, according to the *Pittsburgh Medical Bulletin*.

## SOUTH CAROLINA

**State Medical Election**—Dr William Atmar Smith, Charleston, was chosen president-elect of the South Carolina Medical Association at its recent annual meeting and Dr Thomas A Pitts, Columbia, was installed as president. Dr Joseph Warren White, Greenville, was chosen vice president and Dr Julian P Price, Florence, was reelected secretary-treasurer. The next annual meeting will be held in Spartanburg.

## TENNESSEE

**Personal**—Drs John M Lee, Nashville, and William K Vance Jr, Bristol, were chosen members of the state public health council in March, and Dr Webster B Key, Memphis, was reappointed to a three year term—Dr Frank A Moore, Jackson, has resigned as regional health officer of West Tennessee to become a captain in the U S Army Medical Corps—J Frank Taylor, Martin, has been appointed state supervisor of health and physical education, newspapers reported May 7, to carry on the physical education program of the state department of education.

**Federal Law Invoked to Curb Prostitution**—Federal action to help state authorities stamp out prostitution is meeting with general approval in the twenty-seven counties of Tennessee, where the May act was invoked for the first time on May 21, according to an announcement from Dr Ray Lyman Wilbur, Stanford University, Calif, president of the American Social Hygiene Association. The May act was signed by the President on July 11, 1941 and provides that it shall be unlaw-

ful to engage in prostitution or to aid or abet prostitution within such reasonable distance of any military or naval camp or station as the Secretary of War or Navy shall determine to be needful to the efficiency, health and welfare of the Army or Navy. The American Social Hygiene Association is studying the effects of and public reaction to the application of this new federal law. Newspapers have acknowledged favorable public sentiment concerning the project in the Camp Forrest area, which includes several counties.

## UTAH

**Society News**—The Salt Lake County Medical Society devoted its meeting recently to a symposium on coronary occlusion. Drs Fuller B Bailey discussed "The Historical Background, Etiology and Diagnosis of Coronary Occlusion", Louis E Viko, "Diagnosis and Treatment of Coronary Occlusion" and Robert T Jellison, "Industrial Phase of Heart Disease". All are of Salt Lake City.

## VIRGINIA

**State Medical Board Reelected**—Governor Darden recently reappointed the following members of the state board of medical examiners for a term of four years ending March 31, 1946: Drs Robley D Bates Sr, Newtown, Philip St L. Moncure, Norfolk, Hack U Stephenson, Richmond, William B McIlwaine III, Petersburg, Isaac C Harrison Danville, John W Preston, Roanoke, Philip W Boyd, Winchester, Lewis Holladay, Orange, and Francis H Smith, Abingdon.

**Dr Wampler in Charge of Industrial Medicine**—Dr Fred J Wampler, professor of preventive medicine at the Medical College of Virginia, Richmond, since 1928, has been named professor of preventive and industrial medicine, according to the state medical journal. Dr Wampler graduated at Rush Medical College, Chicago, in 1913. He received his certificate in public health at Johns Hopkins University, Baltimore, in 1929. He was field worker in the Mongolian Shantung pneumonia plague epidemic in 1918, director of health and sanitation of American Red Cross China Famine Relief in 1921 and associate director for Shansi China Council on Health Education from 1922 to 1926, becoming health officer of the Accomac-Northampton Health Unit the following year.

## WASHINGTON

**Dr Dewey Goes to San Antonio**—Dr Leonard A Dewey, Seattle, chief of the division of epidemiology and venereal disease control, Washington State Department of Health, is on leave of absence to the U S Army. Dr Dewey has been placed in charge of venereal disease control in the eighth corps area with headquarters in San Antonio.

## WEST VIRGINIA

**State Society Meeting in Huntington**—The West Virginia State Medical Association will hold its seventy-first annual meeting in Huntington, July 13-15, under the presidency of Dr Richard O Rogers, Bluefield, who will tell of "The War and Medical Trends". The program this year is an innovation which was announced some months ago. Instead of scientific papers making up the general program, a section meeting, a series of symposiums, designed for the general practitioner, will be conducted by guest speakers.

Dr Ralph Irving Lloyd, Brooklyn, The Proptosed Eye as a Problem

Dr Meredith F Campbell, New York, Urological Conditions and Hood

Dr George C Griffith, Philadelphia, Precordial Pain

Dr Bayard T Horton, Rochester, Minn, Heredities Recurrent in Treatment

Dr Francis Bayard Carter, Durham, N C, Management of Distressing in the Course of Normal Labor

Dr John Scudder, New York, Management of Surgical Shock

Dr John Grove Kuhns, Boston, Management of Chorea

Drs William Halsey Barker and Edgar J Poth, Baltimore, and Surgical Aspects of Chemotherapy, respectively

Other features of the program are a talk by H. H. Anslinger, commissioner of narcotics, Washington, D C, "Narcotics as They Affect the Physician", the lecture in medicine by Dr William V Wilkerson, Prenter, "Pneumonia", and the oration on surgery by Dr Rufus J Wheeling, on "A Forty Hour Week for Surgeons". The annual banquet Wednesday evening the speaker will be V McNutt, federal security administrator, and D. S. Dafoe, Callander, Ont.

## GENERAL

**Meeting of Agricultural Chemists Canceled**—The Association of Official Agricultural Chemists, Inc., announces that its meeting planned for October 27-29 will not be held on account of the war emergency.

**Government Hygienists Choose Officers**—Marion F. Trice, Raleigh, N. C. was chosen chairman of the National Conference of Industrial Hygienists at its meeting in Washington, D. C. April 10. Dr. Paul A. Brehm, Madison, Wis., was named vice chairman and Mr. J. J. Bloomfield, Bethesda, Md., secretary-treasurer. The next meeting will be held in Washington, the dates to be announced later.

**Surgical Company Warns of Fraudulent Check Passer**—Kav Surgical, Inc., announces that a "Dr. John M. LaTuff," giving his address as 22 W. Indiana Avenue, St. Paul, Minn., called at their store at 246 Madison Avenue, Memphis, Tenn., and purchased a leather bag and other items. His check on the Security State Bank of St. Paul was returned with the notation "no account." The man was of average size, brunet, between the ages of 30 and 35 and wore a mustache, it was said.

**Relief Committee Names Director**—Dr. Marjorie E. Reed, Plymouth, Pa., was appointed director of Woman Physicians of the Medical and Surgical Relief Committee of America by Dr. Joseph Peter Hoguet, New York, national medical director of the committee, at a meeting on June 7. Dr. Reed, who became affiliated with the committee last February, has built up in Luzerne County, Pa. an active group of women physicians who have sent quantities of supplies to the committee headquarters in New York.

**Nutrition Charts**—The Philadelphia Child Health Society has prepared for distribution charts showing the vitamin content of average servings of various vegetables, also protein, calcium, phosphorus and iron content. On the reverse side of each chart is found information as to the exact content in an average serving of each of the vegetables shown in the chart, the recommended daily allowances, and also information concerning other vegetables not shown in the chart. Material of this type is exceedingly useful in the present effort for improvement of nutrition. The complete set of the eight charts is available at 50 cents, and may be secured from the Child Health Society, Room 609, 311 South Juniper Street, Philadelphia, Pa.

**Pamphlet on the Kenny Treatment of Poliomyelitis**—The National Foundation for Infantile Paralysis, Inc., has made available a booklet entitled "The Kenny Method of Treatment for Infantile Paralysis." The manual covering varying aspects of the disease, is written by Drs. Wallace H. Cole, John F. Pohl and Miland E. Knapp, Minneapolis, all of whom have observed and considered the Kenny method during the two years in which the foundation has financed a study of the treatment at the University of Minnesota School of Medicine, Minneapolis. Copies may be obtained by members of the medical nursing or physical therapy professions by writing to the National Foundation for Infantile Paralysis, Inc., 120 Broadway, New York.

**Lewis Carris Wins Leslie Dana Gold Medal**—Lewis H. Carris, LL.D., New York, director emeritus of the National Society for the Prevention of Blindness has been announced as the recipient of the Leslie Dana Gold Medal, awarded annually for outstanding achievements in the prevention of blindness and the conservation of vision. Mr. Carris was chosen for the award by the St. Louis Society for the Blind, through which the medal is offered by Mr. Leslie Dana of St. Louis on the recommendation of the Association for Research in Ophthalmology. Prior to his retirement in 1940 from active service as managing director of the national society, Mr. Carris had been identified with the work of national and allied groups interested in the conservation of the blind. He is now 72 years of age.

**Nominations for the Theobald Smith Award**—The American Association for the Advancement of Science has announced that nominations for the Theobald Smith Award, consisting of \$1,000 and a bronze medal provided by the Eli Lilly Company of Indianapolis, are now being accepted. The nominees for the award must have been not over 35 years of age on January 1 in the year in which the award is made. The purpose of the award is to recognize demonstrated research in the field of medical science, taking into consideration independence of thought and originality. Each nomination must be accompanied by six copies of reprints of each principal paper of which the nominee is the author. Nominations and supporting material should be sent to Malcolm H. Soule, LL.D., secretary of the section on medical sciences (N) Hygiene Laboratory, University of Michigan, Ann Arbor, Mich. Dr. Soule is also secretary of the award committee.

**New Officers of Medical Golfing Association**—Dr. John B. Morgan, Cleveland, was elected president of the American Medical Golfing Association at its twentieth annual tournament at the Seaview Country Club, Atlantic City, N. J., June 8. Vice presidents are Drs. Waltman Walters, Rochester, Minn., and John Pennington, Atlantic City. William J. Burns, Lansing, Mich. was reelected executive secretary of the group to serve his fourteenth term. The next tournament will be at San Francisco in June 1943. Dr. Daniel A. Williams, Kansas City, Mo. won the Will Walter trophy, symbolic of the championship of the tournament, with a score of 154 for thirty-six holes. Dr. Thomas A. Kyner, Kansas City, won the Detroit trophy for thirty-six holes low net with a posted 163 gross against a 14 stroke handicap for each round for a net score of 135. The St. Louis trophy was won by Dr. John Murphy, Detroit, for the second best low gross score and Dr. John H. Harris, New York, took the President's trophy with second best net score.

## CORRECTION

**Mustard Gas Injuries to the Eyes**—The abstract entitled "Mustard Gas Injuries to Eyes" in the Current Medical Literature department of THE JOURNAL, June 13, page 588, contains the statement "1 drop of a 5 per cent isotonic solution may be instilled." This is an error. The line should read "1 drop of a 0.5 per cent isotonic solution."

**The Renaissance of Prostatectomy**—In the article by Dr. Edwin Davis in THE JOURNAL, June 6, the words "prostatic resection" inadvertently appeared toward the end of the third paragraph on page 489, when "prostatectomy" was meant. The sentence should read "By the intelligent, prostatectomy is now regarded as a welcome means of relief rather than *le dernier ressort*."

## Government Services

### New Veterans' Hospital in Illinois

The Veterans' Hospital at Marion, Ill., for general medical and surgical patients has been completed at a cost of \$1,500,000. The new construction consists of a main hospital building to care for 167 patients, dining hall and kitchen facilities, residences for staff officers and nurses attendants' quarters, boiler house laundry and garage. The five story main hospital and administrative building is faced with Indiana limestone and provided with polychrome terra cotta spandrels. The basement of the building is devoted to the physical therapy department, necropsy rooms and morgue and a chapel. The first floor is

Veterans Hospital at Marion Ill

given over to administrative and clinical activity which include units for roentgen therapy, dental, eye, ear, nose and throat, laboratory work and examination. The second and third floors of the building are devoted to ward purposes, each floor being divided into two separate ward units completely equipped and staffed by a doctor and nurse. Operating rooms are located on the fourth floor. The main building can be expanded to accommodate about 400 patients by the construction of a wing at either end of the building. Space has been allowed for the expansion of all buildings in the utility group when this becomes necessary. To the rear of the hospital group will be three 392-bed barrack buildings for the care of domiciliary members. One domiciliary building will be built soon and the remainder at a later date, giving this facility an ultimate capacity of about one thousand five hundred and seventy beds.

Foreign Letters

LONDON

(From Our Regular Correspondent)

May 16, 1942

Cross Infection in Hospital Wards

At the Royal Society of Medicine a discussion took place on cross infection in wards. Dr Robert Cruickshank said that the streptococcus was the arch enemy but that staphylococcal infections were becoming common in evacuated infant nurseries, gastroenteritis was a common infection among young children, and diphtheritic cross infection, often symptomless, could give trouble in diphtheria, scarlet fever and measles wards. Dealing with respiratory infections, in which air was the principal vehicle, when a person with an acute infection sneezed he ejected many droplets most of which described a short trajectory to the ground, but a proportion of minute droplets remained suspended in the air for short periods and might be an important factor in air borne infection. Falling on the surface, they might be raised again into the air as infected dust. For the control of infection adequate ventilation, bed spacing and isolation accommodation were necessary. Screens might be an alternative to isolation, but they should reach to the floor. For attendants there should be a freer use of masks. Dust was a major problem in streptococcal and diphtheritic wards. Much could be done by instruction of the nursing staff in the newer ideas as to infection by ward discipline and tackling the problem of dust.

Dr R. H. Dobbs said that the first approach to the problem should be by satisfactory hospital architecture. There should be an admission ward with cubicles in which the child spent the first forty-eight hours. Ward units should consist of six to eight cots, with cubicles in which infectious children could be nursed. But many hospitals had to do their best with twenty or thirty beds in the ward and no admission unit. Here movable glass screens had been of great advantage. In hospitals for infectious diseases there should be 12 feet bed spacing between cot centers. Masks should be worn by physicians and nurses.

Dr N. D. Begg said that in fever hospitals one must guard against secondary infection by different types of the primary infecting organism. In the North-Eastern Hospital, London, the principle of structural separation culminated in single or double bed isolation units in the proportion of 40 per cent of the total. The most difficult problems were the enteric infections of unknown etiology, which included infantile gastroenteritis. In the control of this serious risk to infant life breast feeding was the most important single preventive measure. As to respiratory infections, the hemolytic streptococcus was widespread in its activity in fever hospitals. Cross infection, as indicated by change of infecting type, was frequent in scarlet fever wards.

Mr Wylie McKissock said that there was a regrettable tendency to minimize hospital infection of wounds. He described a hospital with *Streptococcus pyogenes* infection in his department of neurosurgery in cases of clean operation wounds or wounds of the head of varying degrees of severity. Before the adoption of a special system of ward precautions, nursing care and dressing technique the percentage of cases of hospital infection was 15.4. After its adoption the percentage was reduced to 1.1 and later to 0.8. The reservoir of the streptococcus still existed in the wards during the period of control.

Medical Views of the Falling Birth Rate

The serious threat to our population due to the falling birth rate continues to attract attention. Prof. Munro Kerr, president of the Obstetrical and Gynecological Section of the Royal Society of Medicine, has made a medical contribution to the discussion in the form of a communication to the *Times*. The annual birth rate per thousand of population for England and Wales was 32.4 for the decade 1881-1890 (average), 18.3 for the decade 1921-1930 (average), 14.9 for the year 1939 and 14.6 for the year 1940. Up to the present the fall in the birth rate has been offset to a considerable extent by the dramatic fall in the infant death rate in the present century—from 150 to 25 per thousand live births. But this compensation must necessarily diminish. Notwithstanding the general fall of infant mortality there has been little lowering of the stillbirth rate or neonatal (first month) mortality, as these figures show.

Rates per Thousand Live and Stillbirths  
(England and Wales)

| Year | Stillbirths | Neonatal Death Rate<br>(Ages 0-4 Weeks) | Combined<br>Rate |
|------|-------------|---|------------------|
| 1928 | 40.1        | 29.8                                    | 69.9             |
| 1929 | 40.0        | 31.5                                    | 71.5             |
| 1936 | 39.7        | 29.0                                    | 68.7             |
| 1937 | 39.0        | 29.6                                    | 68.6             |

Munro Kerr states that not all these deaths are preventable but something between 30 and 50 per cent could be prevented by improved antepartum, intrapartum and postnatal care. For this purpose he has been advocating for twenty years a national maternity service in which obstetric specialists and the public health service would work in cooperation. He quotes from the brochure *Population and Fertility*, issued by the Population Investigation Committee in 1939 under the editorship of D. V. Glass (statistician) and C. P. Blacker (physician and secretary of the Eugenics Society). "The causes of the decline of fertility are numerous, complex and deep seated. In western European countries they form so intimate a part of the twentieth century view of life that effective countermeasures will not be easy to find. What we should do is not to suppress birth control but to remove as many as possible of the obstacles impeding the free expression of the parental instinct. Conditions should be created in which people would want to have children."

Munro Kerr thinks that there is little prospect that the birth rate can be increased unless the government tackles the problem seriously and introduces radical measures. Unfortunately no political party looks far ahead or has much vision. That is true to small minorities who are called "alarmists." He warns the government, as others have done, that the situation will become desperate in some years, when hurried legislation will be late.

In the *Times* Sir Francis Freemantle (expert on public health and member of parliament) points out that the present birth rate of 14.1 per thousand is matched against the death rate. But the crude death rate of 14 must almost certainly rise. Every infant has now a life expectation of 60 years, which represents a true death rate of 1,000 divided by 60, or 16.6. The Population Investigation Committee made a estimate by the most scientific method—the net reproduction rate—which is defined as the average number of children which will be born to each newborn child if the present birth and death rates continue. To maintain the population the rate must be unity. But the committee found that the rate for the child bearing ages—from 15 to 50 years—was only three fourths of the children required to maintain the numbers. Dr Charles has shown that, if fertility rates remain constant as in 1935, our population of 41,000,000 will be reduced to 20,000,000 in 100 years.

shrink in forty years to 36 000 000 and in one hundred years to 20 000 000, but if fertility and mortality continue to decline as in recent years the figures would shrink to 31,500,000 and 4 500 000 respectively.

### Smoking in Wartime

In normal times many persons smoke tobacco especially cigarettes to excess. During the war the habit seems to be much increased. In the *Times* a physician Sir Maurice Cassidy says in a communication that nobody who travels by road or rail can fail to be impressed by the amount of smoking in the fighting services. Most of the men seem to have an unlimited supply of cigarettes which they never cease to smoke. When he asked if any attempt was made to curb their addiction they told him that it is very difficult not to smoke when everybody is smoking that their officers smoke as much as they do and that a lecture generally begins with the words 'You may smoke,' when everybody automatically lights a cigarette. Now these men are being trained to fight for their lives. Yet were they being trained for a soccer cup tie or a boat race their smoking would be seriously restricted if not stopped. The cigarette impairs the oxygen carrying capacity of the blood by the carbon monoxide inhaled. At the same time it often ruins digestion and diminishes resistance to respiratory infection. We are rationed in meat milk eggs sugar butter and clothing. Surely, says Sir Maurice Cassidy, the time has come to ration tobacco and thereby increase our efficiency.

### Examination of Young Persons for the Detection of Tuberculosis

The National Association for the Prevention of Tuberculosis has issued a memorandum concerned with the health of young persons of school age or about to enter industry, showing the importance of discovering symptomless tuberculosis. Pulmonary tuberculosis begins without the patient's knowledge and, when he comes for treatment is advanced and he has probably infected others hence the importance of early diagnosis in the prevention of the disease. As this can be done, it is said, only by x-ray examination of the chest, the association holds that more x-ray examinations of apparently healthy young persons are needed. In 1941 the trade union congress passed a resolution urging the government to provide for such examination not less than a year after young persons enter industry and its repetition every year until the age of 18. In the opinion of the National Association for the Prevention of Tuberculosis every young person should be radiologically examined on leaving school as well as at intervals during early adult life. Those who enter the fighting services could easily be included in this scheme and also those entering other government and municipal services. Young persons in secondary and technical schools and in colleges and universities are at a period of life when physical and mental strain is great and the incidence of tuberculosis high. The association appeals to physicians responsible for health in these institutions to inaugurate the use of routine radiologic examination.

### New Food Restrictions

The general policy of the government has been as far as possible to insure that every person has a due supply of food and that no one whatever his means, more than that. Up to the present there has not been much control of the food served in hotels and restaurants though the effects of the war are evident in the menus. The government now announces new restrictions. Meals are limited to a maximum of three courses. Provision will be made to prohibit the sale of fish game and poultry in any hotel or restaurant on specified days in order that these articles may be more readily available for domestic consumption. For the remainder of the war the government will discourage other than for public purpose, the holding of

luncheons and dinners attracting large numbers of people. The serving of food after 11 p.m. will be prohibited except to residents at hotels and establishments catering for night workers. The effect of this prohibition will be to stop the sale of food at night clubs and similar places. These decisions were reached by a committee of the cabinet, which examined the whole subject of meals in hotels and restaurants, criticisms of 'luxury feeding' and the effect on public morale. A maximum of three courses may not seem to be a hardship, but at present five—hors d'œuvres, soup, main dish fish, meat or poultry—are fairly common in hotels.

### Changes in the British Pharmacopoeia to Save Alcohol

In a previous letter the restrictions in the prescribing of many drugs brought about by the war was described. Economy in alcohol is essential and it was mentioned that alternatives for preserving surgical instruments from rust were suggested. In the fifth addendum to the British Pharmacopoeia, which is about to be published, many modifications have been made in the preparations for internal use. The principal one is the introduction of eleven concentrated tinctures. The following are four times as strong as before, so that only a fourth of the amount of alcohol consumed in a certain dose of the active ingredient will be necessary: concentrated tincture of orange, lemon, capsicum, quassia, concentrated compound tincture of cardamon, cinchona and gentian, concentrated ethereal tincture of lobelia, and ammoniated tincture of valerian. The new concentrated camphorated tincture of opium is eight times as strong. The liquid extracts of quillaia and of squill of the British Pharmacopoeial Codex and emulsions of chloroform and peppermint are also made official. There is a new concentrated solution of ethyl nitrite about eight times as strong as the spirit of nitrous ether and a new aromatic solution of ammonia equivalent in strength to ammoniated spirit.

### Diphtheria Prophylaxis

The minister of health announces that he is glad that at least one third of the child population under 15 has been immunized against diphtheria. But if the incidence and mortality of diphtheria are to be substantially reduced at least 3 out of every 4 children should be immunized. In view of this as well as the extra risks of wartime conditions and the importance of avoiding all preventable demands on hospital accommodation he urges vigorous efforts to immunize the greatest possible number of children. Diphtheria is now the most fatal disease among children between the ages of 4 and 10 years and the second most fatal between 2 and 5 years. To protect these susceptible age groups it is important to immunize children under school age. The minister suggests that the local health authorities, with the cooperation of the press should institute a campaign to make known to parents the advantage of immunization and the clinics at which it is carried out.

In Scotland the campaign for immunization has been very successful. Among 766 000 children immunized there was only 1 death from diphtheria in 1941 but among the 389 000 not immunized there were 418 deaths.

---

## Marriages

---

GUNNAR D. QUILSING to Miss Helen Anderson, both of Madison, Wis., at Camp Stewart, Ga., March 29.

EDMUND JAMES BROGAN, Philadelphia, to Miss Miriam Elizabeth Brown of Wynnwood, Pa., March 21.

ERNEST COLE STRODE, Louisville, Ky., to Miss Mary Marjorie Byrne in St. Matthews, April 3.

ROY V. TAYLOR, Lenoir City, Tenn., to Miss Edith Quillen in Philadelphia, Tenn., recently.

## Deaths

**Max Samuel Wien** \* Chicago, Rush Medical College, Chicago, 1920, in 1922 joined the staff of the University of Illinois College of Medicine as an instructor in the department of dermatology, subsequently serving as associate, assistant professor and associate professor, since 1932 professor of dermatology at the Cook County Graduate School of Medicine, associate attending dermatologist at Research and Educational Hospital and a member of the staff of Michael Reese Hospital, at one time served on the staffs of Mount Sinai and Cook County hospitals, member of the American Academy of Dermatology and Syphilology, the Society of Medical History, the Institute of Medicine of Chicago and the Chicago Dermatological Society of which he had once served as president and secretary, a diplomate of the American Board of Dermatology and Syphilology, author and co-author of books concerned with his specialty, aged 46, died, June 23, of cerebral embolism.

**Ernest Harl White** \* Little Rock, Ark., Harvard Medical School, Boston, 1922, instructor in microscopic anatomy and consecutively clinical instructor, assistant professor, associate professor of obstetrics and gynecology and professor of obstetrics at the University of Arkansas School of Medicine, diplomate of the American Board of Obstetrics and Gynecology, member of the Central Association of Obstetricians and Gynecologists, past president and secretary of the Pulaski County Medical Society, president of the Arkansas Society of Obstetrics and Gynecology, formerly consultant in obstetrics for the state board of health, on the staffs of St. Vincent's Infirmary, Baptist State and City hospitals, aged 58, died, April 11.

**Maurice Lewison** \* Chicago, Northwestern University Medical School, Chicago, 1906, professor of medicine and formerly professor of physical diagnosis at the University of Illinois College of Medicine, diplomate of the American Board of Internal Medicine, fellow of the American College of Physicians, attending physician from 1919 to January 1942 and since then senior attending physician, Mount Sinai Hospital, and president of the staff from 1919 to 1929 and honorary president since 1929, on the consultant emeritus staff of the Cook County Hospital, senior author of a book entitled "Manual of Physical Diagnosis", aged 56, died, June 17, in St. Luke's Hospital of brain tumor.

**Lincoln Fleetford Sise** \* Brookline, Mass., Harvard Medical School, Boston, 1901, diplomate of the American Board of Anesthesiology, Inc., member of the American Society of Anesthetists, Inc., clinical assistant in anesthesia at the Harvard Medical School, Courses for Graduates, from Sept. 1, 1916 to Sept. 1, 1927, lecturer on anesthesia at the Tufts College Medical School, Boston, from 1920 to 1923, served during World War I, at one time assistant visiting anesthetists, Boston City Hospital, and visiting anesthetist, Long Island Hospital, Boston, formerly chief anesthetist of the Lahey Clinic, Boston, aged 67, died, April 28, of arteriosclerosis.

**John J. Chandler**, Lutesville, Mo., St. Louis College of Physicians and Surgeons, 1892, member of the Missouri State Medical Association, for many years bank president, member of the Bollinger County Selective Service System, member of the draft board during World War I, formerly county coroner and member of the school board, aged 77, died, May 5, in St. Francis Hospital, Cape Girardeau, of burns received when his clothes became ignited from a flaming wastepaper basket.

**George Bradley McFarland**, Bangkok, Thailand, Western Pennsylvania Medical College, Pittsburgh, 1890, College of Physicians and Surgeons, Baltimore, 1891, also a dentist, for many years a medical missionary, emeritus professor of medicine at the Chulakankarana University Faculty of Medicine, Thailand, formerly known as the Royal Medical College, where he was dean, held many Thailand decorations, aged 75, died, May 3.

**Aloysius Nicholas J. Dolan**, Excelsior Springs, Mo., College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1898, member of the Missouri State Medical Association, for many years associated with the U. S. Veterans' Bureau, aged 70, on the staff of the Veterans Administration Facility, where he died, April 5, of arteriosclerotic heart disease with myocarditis and bronchopneumonia.

**Ithimer Maxwell Casebeer**, Clinton, Ind., Rush Medical College, Chicago, 1893, served as a captain in the medical corps of the U. S. Army during World War I and at the time of his death held the rank of lieutenant colonel in the Auxiliary Officers Reserve Corps, aged 72, died, May 4, in the Vermillion County Hospital of embolus during an operation for removal of the left kidney.

**Charles R. Borzilleri**, Buffalo, University of Buffalo School of Medicine, 1895, member of the Medical Society of the State of New York, fellow of the American College of Surgeons, past president of the Medical Society of the County of Erie, a founder and formerly medical director of the Buffalo Columbus Hospital, aged 69, died, May 31, in North Evans, N. Y., of coronary thrombosis.

**Edward Chase Durgin**, Marshfield Hills, Mass., Tufts College Medical School, Boston, 1901, served as a captain with the American Expeditionary Forces during World War I, at one time associated with the U. S. Public Health Service, formerly school physician and medical adviser to the board of health of Marshfield Hills, aged 64, died, April 26.

**Basil Taylor Bennett Sr.**, Trenton, Tenn., University of Nashville (Tenn.) Medical Department, 1893, Vanderbilt University School of Medicine, Nashville, 1893, member of the Tennessee State Medical Association, formerly health officer of Trenton, for many years a member of the school board, aged 70, died, May 3, of metastatic carcinoma.

**Thomas Clyde Emmick**, Mount Vernon, Ind., Medical College of Ohio, Cincinnati, 1897, at various times secretary of the board of health of Mount Vernon, medical director of the county draft board during World War I, aged 69, died, May 14, in the Welborn-Walker Hospital, Evansville, of pneumonia following a cerebral hemorrhage.

**Lambert Henry Weinheimer**, Syracuse, N. Y., Syracuse University College of Medicine, 1909, member of the Medical Society of the State of New York, attending ophthalmologist at St. Joseph Hospital and St. Mary's Maternity Hospital and Infants Asylum, aged 54, died, April 7, of cerebral hemorrhage and cardiorenal vascular disease.

**Charles Ernest Clark**, Gaziantep, Turkey, Asia, University of Michigan Department of Medicine and Surgery, Ann Arbor, 1902, for many years a medical missionary, conducted clinics in isolated villages and was on the staff of the American Hospital, aged 67, died, April 28, of pneumonia and emphysema.

**George Edward Tuers**, Paterson, N. J., Jefferson Medical College of Philadelphia, 1899, member of the American Board of Anesthetists, Inc., past president of the Passaic County Medical Society, chief anesthetist of the General Hospital, aged 64, died, April 20, of chronic myocarditis and arterial sclerosis.

**William Lester Grogan**, Utica, N. Y., Albany Medical College, 1915, served overseas in the U. S. Army during World War I, aged 53, consultant on the staffs of the Utica State Hospital and the Marcy (N. Y.) State Hospital, on the staff of St. Elizabeth Hospital, where he died, May 23.

**George Wilbur Duvall** \* Shelbyville, Ky., Hospital College of Medicine, Louisville, 1906, for many years superintendent of the Central Free Dispensary at Rush Medical College, Chicago, at one time health officer of the Davies County (Ky.) Health Department, aged 61, died, May 1.

**George Frederick Glass**, Cleveland, College of Physicians and Surgeons, Baltimore, 1893, served as a major in the medical corps of the U. S. Army in France during World War I, aged 73, died, April 27, in the Cleveland Clinic Hospital of hypertensive cardiovascular disease.

**Henry Jackson Daily**, Oklahoma City, Southern Homeopathic Medical College and Hospital, Louisville, 1903, member of the Oklahoma State Medical Association, formerly president of the school board and mayor of Louisville, Ky., aged 67, died, April 26.

**Eustace Cameron Butler** \* Caldwell, N. J., University College of Physicians and Surgeons, 1906, fellow of the American College of Surgeons, surgeon, Essex County Hospital, Cedar Grove, N. J., died, May 12.

**Milton Henry Wells** & Watertown, Tenn., University of Nashville Medical Department 1901, formerly member of the city council and board of health, aged 79, was killed, April 1, when the automobile in which he was driving was struck by a train

**Laura H Satterthwaite**, Trenton N J, Woman's Medical College of Pennsylvania Philadelphia 1888 formerly member of the board of trustees of the Jesus Hospital Philadelphia, aged 80, died, April 19, of carcinoma of the ascending colon

**Pasquale Ferrari**, Pittsburgh, Regina Università di Napoli Facoltà di Medicina e Chirurgia Italia 1896, member of the Medical Society of the State of Pennsylvania, aged 70, died April 29, of arteriosclerosis and chronic valvular heart disease

**John Edward Waaser**, East March Chunk Pa Hahnemann Medical College and Hospital of Philadelphia 1893, member of the Medical Society of the State of Pennsylvania, formerly member of the school board, aged 72, died, April 27

**David Edward Froehlich** & Oakland, Calif., Northwestern University Medical School, Chicago 1921, fellow of the American College of Surgeons, member of the staffs of the Alameda County and Providence hospitals, aged 49, died April 21

**Joseph Von Culin Roberts**, Philadelphia, Medico-Chirurgical College of Philadelphia 1900, member of the Medical Society of the State of Pennsylvania, aged 70, died recently in the Presbyterian Hospital of a ruptured aorta

**Frank L Adams**, Elberton Ga Southern Medical College, Atlanta 1890, member of the Medical Association of Georgia represented Elbert County in the General Assembly of Georgia for a number of terms, aged 74, died May 3

**Leo Wolfenstein** & Cleveland University of Wooster Medical Department Cleveland 1906, at one time associated with the U S Public Health Service, formerly on the staff of the Mount Sinai Hospital, aged 68, died April 3

**Norman McLeod Allen** & Detroit, Detroit College of Medicine, 1910, diplomate of the American Board of Surgery, fellow of the American College of Surgeons, aged 59, on the staff of the Harper Hospital, where he died, May 9

**James Joseph Sebastian Walsh** & New York, Columbia University College of Physicians and Surgeons, New York, 1901, veteran of the Spanish-American War and World War I, aged 65, died in April in the Union Hospital

**Leighton Randolph Cornman**, South Pasadena, Calif., Columbia University College of Physicians and Surgeons New York 1903, aged 63, died March 14, in North Hollywood of injuries received when struck by an automobile

**Grafton D P Bailey**, Washington, D C, National University Medical Department Washington, 1896, member of the Medical Society of the District of Columbia, formerly mayor of North Beach, Md, aged 67, died, May 18

**Daniel D Costigan**, Trinidad, Colo., Detroit College of Medicine 1911 member of the Colorado State Medical Society on the staff of Mount San Rafael Hospital, aged 63, died April 22 in Pueblo of cerebral hemorrhage

**Abraham David Eisenberg**, Brooklyn, Columbia University College of Physicians and Surgeons, New York, 1906, member of the Medical Society of the State of New York, aged 60, died May 13 of heart disease

**George A Martin**, Lafayette La, Medical Department of Tulane University of Louisiana New Orleans 1887, formerly mayor, city judge and city physician, at one time member of the school board, aged 81, died, May 6

**Emil Constantine Bernauer** & Brooklyn, University of the City of New York Medical Department, New York, 1891, consulting dermatologist to the Wyckoff Heights and Brooklyn State hospitals, aged 72, died May 25

**Samuel Harvey Corrigan**, Lampman Sask, Canada, Trinity Medical College Toronto Ont 1896 fellow of the American College of Surgeons, aged 71, died, May 1, in Winnipeg of coronary thrombosis

**John W Reed**, Bay City, Texas (licensed in Texas, under the Act of 1907), member of the State Medical Association of Texas, at one time local surgeon for the Aransas Pass Railroad, aged 91, died recently

**Edward Richard Sill**, Oakland Calif., College of Physicians and Surgeons, medical department of Columbia College, New York 1889, formerly member of the county board of health, aged 80, died, April 16

**Charles Francis Stack**, Boston, Harvard Medical School, Boston 1898, member of the Massachusetts Medical Society, aged 71, died, April 3, in the Boston City Hospital of arteriosclerotic heart disease

**Joseph Wilbert Shelar**, Mount Pleasant Pa, Long Island College Hospital, Brooklyn, 1886 on the staff of the Henry Clay Frick Memorial Hospital, aged 82, died, April 18, of cerebral hemorrhage

**Alfred L Suhr** & Milwaukee, Marquette University School of Medicine, Milwaukee, 1927, member of the staff of the Milwaukee County Hospital, Wauwatosa, aged 43, died, April 8, in a local hospital

**Emmett R Giesey**, Harrisburg, Pa (licensed in Ohio in 1896), at one time mayor and member of the school board of Toronto, Ohio, aged 83, died April 26 of cerebral hemorrhage and hypertension

**Robert Lee Wills**, Neosho, Mo, Missouri Medical College, St Louis, 1884, formerly member of the state board of health, aged 79, died, April 29, of chronic myocarditis due to arteriosclerosis

**David Llewellyn Dial**, Concord N H, Western Reserve University School of Medicine Cleveland, 1931, pathologist on the staff of the New Hampshire State Hospital, aged 34, died, April 20

**Minnie Arnold-Huneker**, Browns Mills, N J, Temple University School of Medicine Philadelphia, 1912, member of the Medical Society of the State of Pennsylvania, aged 70, died May 26

**Samuel A Blauner** & New York, Columbia University College of Physicians and Surgeons New York 1904, attending pediatrician on the staff of the Lebanon Hospital, aged 60, died, May 17

**Roy Sumner Wells** & Colville Wash, Rusli Medical College, Chicago 1900 formerly secretary of the Stevens County Medical Society, aged 65, died April 5 of heart disease and arthritis

**Silas Elliott Woods**, San Benito Texas, Marion-Sims College of Medicine St Louis 1894, aged 74, died, April 18, in the Valley Baptist Hospital Harlingen, of coronary thrombosis

**Christian Martz**, Fort Wayne Ind, Hahnemann Medical College and Hospital, Chicago 1882, aged 88, died May 23, in the Lutheran Hospital of cardiorenal disease and pneumonia

**Joseph P Werner**, O'Fallon, Mo, St Louis College of Physicians and Surgeons 1906, aged 64, died April 1 in the Firmin Desloge Hospital St Louis, of carcinoma of the liver

**William Roane Aylett**, Tappahannock, Va University of Virginia Department of Medicine Charlottesville, 1895, member of the Medical Society of Virginia, aged 70, died recently

**Addie Board-Arthur**, Kansas City, Mo, Woman's Medical College Kansas City Mo 1899, aged 71, died, April 30, of hemopericardium following rupture of the heart

**Robert Martin Powers**, New Kensington Pa, Western Pennsylvania Medical College, Pittsburgh, 1890, aged 80, died, April 1, of arteriosclerosis and chronic nephritis

**Samuel Newell Watson**, Santa Barbara Calif, State University of Iowa College of Homeopathic Medicine, Iowa City, 1893, also a clergyman, aged 81, died recently

**Lawrence C Creighton** & Unity Pa College of Physicians and Surgeons Baltimore, 1908, bank president, aged 62, died May 3 of chronic valvular heart disease

**Albert Nelson Oyen** & Chicago, Rush Medical College, Chicago, 1905, on the staff of the Lutheran Deaconess Hospital, aged 63, died April 19, in Orlando Fla

**Walter Everly**, Seattle, Rush Medical College, Chicago 1902, served as a major in the medical corps of the U S Army during World War I, aged 64, died April 8

**Alva M Ashcraft**, Leesville, Ohio Baltimore Medical College, 1903, member of the Ohio State Medical Association, aged 61, died, April 29, of diabetic gangrene

**William H Walker**, Omaha, John A Creighton Medical College, Omaha, 1901, aged 72, died, April 14, in the Nicholas Senn Hospital of hypertensive heart disease

**Charney Cale**, Mobile, Ala., Memphis (Tenn.) Hospital Medical College, 1904, aged 66, died, April 23, in a local hospital of bronchopneumonia and asthma

**Harry Howard Hanna**, Waterloo, Iowa, Rush Medical College, Chicago, 1888, aged 78, died, April 20, in the Presbyterian Hospital of cerebral thrombosis

**Louis Montrose Haight**, Stockton, Calif., Cooper Medical College, San Francisco, 1903, member of the California Medical Association, aged 73, died April 27

**Charles Walter Winne**, Chicago, College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois 1903, aged 65, died, April 8

**Ernest B Baker**, Edcouch, Texas, Tulane University of Louisiana School of Medicine, New Orleans, 1896, aged 70, died in April of carcinoma of the colon

**Malcolm Ferguson**, Toronto, Ont., Canada, Trinity Medical College, Toronto, 1892, L R C P, Ireland, and L R C S, Ireland, 1892, aged 79, died, March 2

**Kenneth William Davis**, Green Bay, Wis., University of Wisconsin Medical School, Madison, 1933, aged 33, died, April 24, of accidental paraldehyde poisoning

**LeRoy S Colter**, Glendale, Ohio, Miami Medical College, Cincinnati, 1888, formerly on the staff of the Christ Hospital, Cincinnati, aged 80, died, March 23

**William Western Warren**, Newport, Ohio, Columbus Medical College, 1889, member of the Ohio State Medical Association, aged 73, died, April 4

**Almerin Webster Baer**, Gary, Ind., Rush Medical College, Chicago, 1889, aged 80, died, May 11, in the Methodist Hospital of cerebral hemorrhage

**Clarence Porter Macdonald** Ⓢ Pittsburgh, Western Pennsylvania Medical College, Pittsburgh, 1907, aged 61, died, March 15, in Miami Beach, Fla

**Jesse Linus Stowers**, Clinton, Ind., Indiana Medical College, School of Medicine of Purdue University, Indianapolis, 1906, aged 77, died, April 26

**Arthur Vincent Payne**, New York, New York University Medical College, New York, 1897, aged 76, died recently at his home in Brooklyn

**Grant Judson Gray**, Oakridge, Ore., Cleveland University of Medicine and Surgery, 1894, served during World War I, aged 87, died, April 27

**Archibald Franklin Malloy**, Saskatoon, Sask., Canada, University of Toronto Faculty of Medicine, Toronto, 1904, aged 63, died, April 20

**Edmund Lee Awtry**, Atlanta, Ga., Southern Medical College, Atlanta, 1896, aged 73, died, May 22, of cerebral hemorrhage and hypertension

**Joseph Malvern Douthett**, Pittsburgh, Bellevue Hospital Medical College, New York, 1890, aged 78, died, April 28, of cerebral hemorrhage

**Otto Clarence Benage**, Conway, Mo., St. Louis College of Physicians and Surgeons, 1901, aged 66, died, April 24, of coronary occlusion

**John Willis Baker**, Enid, Okla., Northwestern Medical College, St. Joseph, Mo., 1893, aged 73, died, April 30, of coronary embolism

**Richard Kershner Loewen** Ⓢ Boyertown, Pa., University of Pennsylvania School of Medicine, Philadelphia, 1919, aged 49, died, May 10

**William Edward Miller**, Ludowici, Ga., College of Physicians and Surgeons, Baltimore, 1898, aged 72, died in April in Walthourville

**Moritz Muldberg**, New York, University of the City of New York Medical Department, New York, 1888, aged 74, died, April 14

**James William Urie**, Kennedyville, Md., Hahnemann Medical College and Hospital of Philadelphia, 1886, aged 78, died, April 14

**J Andrew Harper**, Crawfordville, Fla., Georgia College of Eclectic Medicine and Surgery, Atlanta, 1902, aged 73, died, April 10

**Otto Victor Wille**, Iowa City, State University of Iowa College of Medicine, Iowa City, 1912, aged 58, hanged himself, April 19

**William F Dickinson**, Queen Anne, Md., Geneva (N. Y.) Medical College, 1867, aged 99, died, April 21, of chronic myocarditis

**Isaac Kupperman**, Newark, N. J., Long Island College Hospital, Brooklyn, 1905, aged 67, died, April 28, of coronary thrombosis

**Osborne Lee Moore**, Jefferson City, Mo., University Medical College of Kansas City, Mo., 1891, aged 78, died April 18

**John Percival McKinnon**, Guelph, Ont., Canada, University of Toronto Faculty of Medicine, 1904, aged 70, died recently

**William Henry Smithson**, New Park, Pa., University of Maryland School of Medicine, Baltimore, 1905, aged 64, died April 6

**Wiley Schell Millyard**, Coboconk, Ont., Canada, University of Toronto Faculty of Medicine, 1908, aged 57, died, April 9

**John E Alford**, Okoloma, Ark., Gate City Medical College, Dallas, Texas, 1906, aged 70, died, May 11, of heart disease

**Joseph Bondi**, New York, Medizinische Fakultät der Universität Wien, Austria, 1896, aged 70, died, April 29, of heart disease

**Julia Clayson Eberle**, Indianapolis, Hahnemann Medical College and Hospital, Chicago, 1889, aged 93, died, May 1

**Charles Edmond West**, Salina, Utah, Physio Medical College of Indiana, Indianapolis, 1885, aged 78, died, April 11

**Hampton D Book**, Henderson, Ky., University of Louisville (Ky.) Medical Department, 1884, aged 81, died, April 20

**Edward Melchers** Ⓢ Toledo, Ohio, Medical College of Ohio, Cincinnati, 1878, aged 85, died, May 18, of myocarditis

**Samuel Harvey Keefauver**, Washington, D. C., Miami Medical College, Cincinnati, 1882, aged 81, died, April 23

**Alvin Everett Reed**, Weir, Miss., University of Nashville (Tenn.) Medical Department, 1905, aged 62, died recently

**Oram Alonzo Nincehelter**, Mechanicsburg, Ohio, Miami Medical College, Cincinnati, 1887, aged 84, died, April 6

**Grover C Stover**, Thornburg, Ark. (licensed in Arkansas in 1908), aged 56, died recently of valvular heart disease

**William G Bower**, Myerstown, Pa., Jefferson Medical College of Philadelphia, 1887, aged 82, died in May

**Alonzo Benjamin Davis**, Philadelphia, Medico Chirurgical College of Philadelphia, 1896, aged 68, died recently

**Samuel G Sevier**, Oenaville, Texas, Kentucky School of Medicine, Louisville, 1889, aged 87, died, April 26

**Samuel Perry Gwaltney**, Rockport, Ind., Eclectic Medical Institute, Cincinnati, 1894, aged 77, died, May 7

**Keith Maurice Morris** Ⓢ Saginaw, Mich., Saginaw Medical College, 1903, aged 59, died in April

**S Morton Pleak**, Murfreesboro, Ark., Keokuk (Iowa) Medical College, 1897, aged 71, died, April 6

**Alfred Laffin Buck**, Chicago, Jenner Medical College, Chicago, 1914, aged 57, died suddenly, May 22

**Silas B Post**, Pittsburgh, Jefferson Medical College of Philadelphia, 1882, aged 84, died, April 28

**Edward Louis Fox**, Houston, Texas, Rush Medical College, Chicago, 1892, aged 73, died recently

**Joseph Pierpont Gillen**, Denver, Miami Medical College, Cincinnati, 1885, aged 82, died, April 21

**Louis Richardson**, Jump River, Wis., Oregon Medical College, 1890, aged 80, died, April 19

**Aaron Emmons**, Scotland, Ark. (licensed in Arkansas in 1903), aged 64, died recently

## Bureau of Investigation

### CEASE AND DESIST ORDERS

#### Abstracts of Certain Federal Trade Commission Releases

The work of the Federal Trade Commission, in helping to protect the public against misrepresentation or fraud in the medical as well as other fields has been greatly extended by the provisions of the Wheeler-Lea Amendment to the Federal Trade Commission Act. The Food Drug and Cosmetic Act of 1938 added to the Food and Drug Administration's control of the advertising claims and statements made on the labels or on the carton or in the accompanying leaflet wherever what might be termed collateral advertising that which appears in news papers and magazines and over the air comes more actively under the purview of the Federal Trade Commission by virtue of the Wheeler-Lea Amendment.

THE JOURNAL has at various times commented on the activities of the Federal Trade Commission in this connection even before the Wheeler-Lea Amendment gave it its added rights. In some cases the Commission may accept from the person or concern involved a stipulation that the objectionable practices or claims cited will be discontinued. In other cases the Commission issues what is known as a Cease and Desist Order, in which the individual or company cited is ordered to cease and desist from practices which have been declared objectionable. Abstracts of some orders issued in 1941 and 1942 follow.

**Aspironal**—This is a product of J. D. Jacobs and P. W. Smith who do business as the Aspironal Company, Atlanta, Ga. In December 1941 the Federal Trade Commission ordered them to cease representing that

Aspironal is a cure or remedy for the common cold, contains an effective amount of aspirin or is of any value exceeding that of temporary relief from pain and discomfort. The Commission also ordered these persons to discontinue any advertisements which did not reveal that the product should not be used by persons suffering from nausea, vomiting, abdominal pains or other symptoms of appendicitis. As an alternative, however, Smith and Jacobs were permitted to place on the packages the warning "Caution: Use Only as Directed." Back in 1935 the Commission also had taken action against the Aspironal Laboratories, Inc. of Atlanta (apparently the same concern) as a result of which that firm signed a stipulation promising that it would cease alleging that its Aspironal was a competent treatment or remedy for hay fever, coughs, catarrhal croup or choking and that it would relieve congestion. Still earlier (1920) a specimen of Aspironal put out by the Aspironal Laboratories of Atlanta had been declared in a district federal court to be false and fraudulent representations as to its efficacy in rheumatism, neuralgia, headaches and la grippe among other things. Government chemists reported that the nostrum then consisted essentially of a solution containing odium salicylate, cascara, a small amount of mydrinate, a kaloids (probably from belladonna) and a trace of menthol.

**Davis Formula No. 7895**—That this preparation is a cure or remedy for asthma or has any value in excess of temporary relief from the paroxysms thereof or that it is a cure or remedy for hay fever or offers any benefit in this condition or will prevent attacks of asthma or hay fever or prevent their recurrence were misrepresentations which the Federal Trade Commission in January 1942 ordered E. R. Davis, trading as E. R. Davis Prescription Company, Bellingham, Wash. to discontinue in his advertising. Nearly three years previously (May 1938) Davis had signed another stipulation with the Commission agreeing that in the sale of Davis Formula No. 7895 and Vitamin A Concentrate he would no longer represent that these would cure asthma, prevent hay fever and build up the mucous membrane of the nose and that such products have given relief after all other treatments have failed.

**Kas Mo Salve**—In December 1941 the Federal Trade Commission ordered G. J. Trucco, trading as Kas Mo Remedy Company, Port Arthur, Texas, to discontinue the following misrepresentations in his advertising of this product: that it is a cure or remedy for pimples, boils, carbuncles, external eruptions of the skin, chronic sores or irritations caused by bad blood or insect bites; that it has any therapeutic value in the treatment of rectal irritations in excess of furnishing temporary relief; and that use of the preparation will prevent the spread of infection.

**Larivière's (Dr. J.) Vegetable Compound**—In November 1941 the Federal Trade Commission ordered Ferd T. Hopkins, trading as D. Watson & Company and its Colonnade Advertising Agency, New York, to discontinue the following advertising misrepresentations which the Commission declared false, deceptive and misleading: that this preparation is a competent or effective treatment for painful menstruation; that it will build up resistance to restlessness, nervousness, cramps, headaches or fainting spells; and that restlessness, nervousness or moodiness in young women are symptoms of dangerous periods imperiling health.

**Magnetic Ray**—This is an electrical device put out by one Frank B. Moran of Dallas, Texas, who does business under the names Magnetic Ray Company and Magnetic Ray Clinic. In December 1941 the Federal Trade Commission ordered Moran to discontinue misrepresentations in

his advertising of the Magnetic Ray as follows: that the device stimulates the healthful function of the various organs and glands and causes rapid increase in the oxidation and elimination of accumulated poisons thereby removing the condition of autotoxemia; that the Magnetic Ray exceeds electricity, light, heat, x-rays or radium rays in therapeutic value; that its use stimulates the normal and healthful functioning of the various organs and glands of the body or equalizes the circulation of the human blood, relieving congestion or lack of blood supply in any part of the body; or that its use stimulates rapid increase in the oxidation and elimination of accumulated poisons thereby removing the condition of autotoxemia.

**Middlebrook's Nostrums**—These are put out by a James R. Middlebrook, M.D., who operates the questionable Middlebrook Hospital and Clinic at Del Rio, Texas, an institution that has played up its work in prostatic disorders. Middlebrook has sold a Special Prostate Package for Home Treatment. The latter includes Colomet, Rhubarb and Colocynth Compound, Special Formula No. 17831 and Methenamine (7½ Grams). In December 1941 the Federal Trade Commission ordered Middlebrook to cease representing that any one of these preparations or the combination of them will relieve pain or soothe or heal the affected parts involved in kidney, bladder, prostatic or rectal diseases; that his Methenamine is one of the best urinary antiseptics for cleansing infection or inflammation from the kidney, bladder, prostatic or urethral canal; that the Special Formula No. 17831 medicates or penetrates the prostate gland by absorption through the tissues in sufficient quantities to be effective; and that the price at which the Special Package is offered for sale constitutes a reduced or introductory price whereas the fact is that this is the price which Middlebrook customarily charges. Further, the Commission ordered Middlebrook to discontinue any advertisements which fail to reveal that the Colomet, Rhubarb and Colocynth Compound is a cathartic and should not be used by persons suffering from nausea, vomiting and abdominal pains or other symptoms of appendicitis, provided however that it will be sufficient to insert in the advertisements the warning "Caution: use only as directed" when the labeling itself is sufficiently cautionary about the use of the product in the conditions stated.

**Old Surgeon's Nostrums**—These are put out by Hiram Carter, Inc., Finlhurst, N. Y., and S. Fred Criffin, president and principal owner of the corporation. In January 1942 the Federal Trade Commission ordered them to discontinue the following misrepresentations in their advertising: that Old Surgeon's preparations constitute a cure, remedy or effective treatment for impotence, loss of energy, indigestion, asthenia or neurasthenia; will prevent premature old age or beneficially affect glands, nerves or organs; that they are a cure or remedy for neuritis, arthritis or other forms of rheumatism or will give more than temporary partial relief from the symptoms of pain or that they have any therapeutic value beyond that of a laxative or analgesic in the treatment of any other disorders except in cases of anemia due to iron deficiency or in certain conditions resulting from a deficiency of thiamin chloride, riboflavin or nicotinic acid where such deficiency is adequately supplied by these preparations. The Commission further ordered the promoters to cease representing that their usual prices are special or reduced ones and that their business facilities are greater than is the fact.

**Queen Brand Capsules**—This product also known as Shrader's Queen Brand Capsules is put out by a Charles Shrader who does business under the name Queen Chemical Company, Mount Lebanon, Pittsburgh. The Federal Trade Commission learned that the product contains apiole, ergot, aloin and oils of sassafras and pennyroyal in quantities sufficient to cause irreparable injury to health if taken under the usual conditions or those prescribed in the advertisements. In December 1941 the Commission ordered Shrader to cease representing that these capsules are a safe and effective treatment for delayed, suppressed, irregular, painful and scanty menstruation and other derangements. The Commission also ordered him to discontinue any advertisement which failed to reveal that the use of these capsules may cause gastrointestinal disturbances, pelvic congestion, excessive uterine hemorrhages and in cases of pregnancy may result in infection of the pelvic organs and blood poisoning.

**Sterling Capsules**—This is a product of Nature's Herb Company, San Francisco, which in January 1942 was ordered by the Federal Trade Commission to discontinue certain advertising misrepresentations. Among these were that the product constitutes a cure for or has therapeutic value in the treatment of various forms of rheumatism such as arthritis and sciatica; aside from its mild temporary action as an analgesic and laxative. The order further prohibited advertisements which failed to reveal that use of the product may be injurious unless its dosage is limited to a period of two or three days; that it should not be taken by persons suffering from nausea, vomiting, abdominal pains or other symptoms of appendicitis; provided however that if the directions on the label contain warnings of these potential dangers it would be sufficient for the advertising to include only the warning "Caution: use only as directed."

**Ton-Jon**—This preparation put out by Grant T. Whiteside, trading as Grant Company, Sahana, Ohio, comes in three forms designated as Nos. 1, 2 and 3. In December 1941 the Federal Trade Commission ordered Whiteside to discontinue the following misrepresentations in the sale of his product: that No. 1 is an effective treatment for numerous disorders of the bowels and stomach; that No. 2 is a powerful remedy for ailments of the liver and gallbladder or will bring relief from impurities of the blood and kindred conditions; and that No. 3 is a competent treatment for kidney and prostatic disorders and will give relief from bladder irritation or accomplish better results than any medicine has done before. Whiteside also was ordered to discontinue any advertisements which failed to reveal that either No. 1 or No. 2 may be dangerous when used by persons suffering from nausea, vomiting, abdominal pains and other symptoms of appendicitis unless he substituted a warning to that effect on the labels of these mixtures.

## Correspondence

### ESSENTIAL HYPERTENSION

*To the Editor*—In THE JOURNAL, April 25, page 1525, appears an answer to a query concerning chronic active glomerulonephritis. The author employs the term essential hypertension. Some speak of essential hypertension if they are unable to demonstrate the factors that are producing hypertension. One might just as well call a person who has lost his legs a pedestrian because he has no feet to walk on. A rather loose diction is used when the author states that part of the treatment consists in careful periodic examinations including tests of renal function and study of the sediment of concentrated urine. Correctly, these procedures are classified as diagnostic and not as therapeutic activities. The author evidently does not believe in a differentiation between nephritic and nephrotic conditions. Only on this basis can be explained his statement that the foundation of the treatment of renal edema is a low salt intake. A characteristic feature of nephrotic conditions is the retention of chlorides within the tissues, which accumulation leads to the attraction and retention of water. As a further consequence, this condition influences the chemical constitution of the nephrotic edema, which contains chlorides but no albumin. The nephritic edema contains proteins but no inorganic salts. In nephritic conditions appears a retention of the organic metabolic end products, therefore, reducing the salt intake in a nephritic patient is not only without any physiologic indication but may also be harmful.

The endocrine glands that control the elimination of the organic metabolic end products require a goodly quantity of salts for maintaining their functions. The human body under all conditions will eliminate salts. In nephritic conditions, unlike nephrotic conditions, there are no salt deposits accumulated in the structures to draw on. Therefore, depriving a nephritic patient of his proper salt intake may increase the retention of organic metabolic end products with all its undesirable sequelae. It is also not quite clear how the author executes his advice that reduction of dietary protein is indicated only if the patient is unable to eat. The author states that out of many of the diuretics acid forming salts and the organic mercurials give the best results in the treatment of chronic renal edema. It is true enough that in mild forms of nephrotic conditions mercurial compounds may be used to advantage. But in pronounced lipid nephrosis bad results are reported following the administration of such drugs. In nephritic conditions the administration of mercurial compounds is strictly contraindicated and their use constitutes a grave therapeutic error. The old rule still holds good that rational therapy must be based on a clear understanding of the normal and pathologic physiology of the organs concerned.

GUSTAV KOLISCHER, M.D., Chicago

**NOTE**—The term "essential hypertension" is so clearly understood by most physicians as to require no defense. Its chief value lies in the absence of specific etiologic implications. There is no objection, however, to omitting its use and substituting the term "hypertensive vascular disease." In the vast majority of cases of hypertension in the earlier stages of the disease, causative factors are not demonstrable.

The correspondent's statements concerning the difference between nephrotic and nephritic edemas are erroneous, because every type of edema fluid contains inorganic salts, chiefly sodium chloride. Therefore, restriction of salt in the diet is the mainstay of treatment, regardless of the underlying disease.

True, such restriction may harm a nephritic patient when the serum sodium and chloride have been greatly reduced as a result of vomiting, excessive urinary loss of salt, severe diarrhea, acute infection or other extrarenal conditions. In these instances there is usually little or no edema, and the patient may be treated like other patients with hypochloremia. It is the dehydration rather than the low serum chloride that is harmful to renal function, as has been shown repeatedly in both human and animal experiments.

Use of mercurials in treatment of chronic nephritic edema is well established. It is contraindicated only in the presence of acute hemorrhagic nephritis or considerable renal insufficiency. If one should follow the correspondent's advice and limit the use of mercury to the pure nephrotic type of renal disease, one might as well discard the drug entirely, since practically all cases of chronic renal edema which require treatment are part of a nephritic process. In the absence of cardiac failure, acute nephritis or uremia, the edema in renal disease is always on a nephrotic basis, that is, due to albuminuria and low plasma albumin.—Ed

### MORTALITY FROM GOUT

*To the Editor*—During the last ten years there were 2,416 deaths attributed to gout in England and Wales, of which 1,616 were of men. During the same period, 1930-1939, there were 25 deaths allocated to this cause in the United States of which two thirds were of men. Allowing for the difference in population, this would be about 10 as compared with 24 in England and Wales. Thus the deaths in this country are only about one two-hundredth of the corresponding deaths in England.

I doubt whether such a remarkable contrast could be found for any other cause of death. This is the more noteworthy because such a large part of our population are of British descent and in many respects the two groups are of a similar nature.

It has been suggested that in Great Britain they have attributed a number of deaths to gout which in this country would be included under chronic rheumatism. It has also been suggested that we do not have a leisure class similar to the upper class of Great Britain. However, there are not nearly enough of the latter to cause 200 deaths a year. That would be several hundred thousand persons over a long period of time.

WALTER G. BOWERMAN, Assistant Attorney  
51 Madison Avenue, New York

### REPRINT COURTESY

*To the Editor*—Authors of scientific articles take great pains in sending reprints to their medical friends and to libraries. They are also pleased to receive letters of comment with a request for a reprint. But they all tire sooner or later of sending to the free reprint collector who sends a form postcard with his name stamped on or who scribbles his request on a postcard. Authors spend many weary hours writing an article and getting it into print, they have to pay for reprints, envelopes and stamps unless they are subsidized to carry on under the auspices of some foundation. So it seems elementary courtesy on the part of a medical man to return a reprint to write on his own stationery and to add a return postage stamp. Only a few physicians, despite the increasing economic duress, most authors in the reprint racket have to ignore what has developed into the

RICHARD KOVACS, M.D.

## Council on Medical Education and Hospitals

### REPORT OF MEETINGS OF THE COUNCIL ON MEDICAL EDUCATION AND HOS- PITALS, HELD IN ATLANTIC CITY, N J, JUNE 6 AND 10, 1942

The status of the University of Georgia School of Medicine was unchanged by the Council on Medical Education and Hospitals of the American Medical Association. The action taken in February 1942 in withdrawing approval of the school was taken without prejudice to any students in the college in September 1942. The present status of the school is such that it would not affect the graduates of the school until after September 1945.

The Council voted after reviewing conditions at the University of Texas Medical Branch Galveston to place the school on probation.

The accelerated program adopted by the medical schools of the country as a war measure was presented to the Council. Sixty-one medical schools have adopted the accelerated program of which fifty will admit a class every nine months and eleven although adopting the accelerated curriculum plan will admit only one class each year.

The Council is prepared to cooperate with the Procurement and Assignment Service in any way possible.

Section I, Administration of the Essentials of an Acceptable School for Clinical Laboratory Technicians was amended by addition of the words "approved medical schools" the amended section to read:

1. Acceptable schools for training laboratory technicians may be conducted by approved medical school, general hospitals or state health laboratories affiliated with hospitals where the majority of the student's practical training is received. This arrangement should not discourage affiliation between the hospital and universities, colleges, public health or other hospitals.

The Council at this meeting took action as follows regarding hospitals for intern training and for residencies and fellowships, as well as schools for the training of clinical laboratory and physical therapy technicians:

#### Hospitals Approved for Intern Training

Doctors Hospital Washington, D. C.  
Orange General Hospital Orlando Fla.  
Pensacola Hospital Pensacola Fla.  
St. Elizabeth Hospital Lafayette Ind.  
Rockaway Beach Hospital and Dispensary Rockaway Beach, N. Y.  
North Carolina Baptist Hospital Winston Salem

#### Approved Residencies and Fellowships

*Gynecology*  
Hospital of the Woman's Medical College of Pennsylvania

*Malignant Diseases*  
State Institute for the Study of Malignant Diseases Buffalo

*Medicine*  
Norwood Hospital Birmingham Ala.  
Fitzsimons General Hospital Denver  
George Washington University Hospital Washington, D. C.  
St. Francis Hospital Peoria Ill.  
St. Mary's Hospital Detroit  
Woman's Hospital Detroit  
Blodgett Memorial Hospital Grand Rapids Mich.  
St. Anthony's Hospital St. Louis  
Greenpoint Hospital Brooklyn  
St. Luke's Hospital New York City  
St. Mary's Hospital Rochester N. Y.  
North Carolina Baptist Hospital Winston Salem  
Bryn Mawr Hospital Bryn Mawr Pa.  
Philadelphia General Hospital Philadelphia  
Hermann Hospital Houston Texas  
Southern Pacific Hospital Houston Texas  
Virginia Mason Hospital Seattle

*Mixed*  
South Highlands Infirmary Birmingham Ala.  
Clinic Hospital (Caylor Nickel Clinic) Bluffton Ind.  
St. Mary's Hospital Evansville Ind.

*Acurosurgeons*  
Pravart Memorial Hospital Chicago  
University Hospitals Minneapolis

*Obstetrics*  
Employees Hospital of the Tennessee Coal Iron and Railroad Company Fairfield Ala.  
Henrotin Hospital Chicago  
Methodist Hospital Indianapolis  
Fairview Park Hospital Cleveland

*Obstetrics and Gynecology*  
Women and Children's Hospital Chicago  
St. Mary's Hospital Detroit  
Temple University Hospital Philadelphia  
Hermann Hospital Houston Texas

*Ophthalmology*  
Wesley Memorial Hospital Chicago  
Philadelphia General Hospital Philadelphia

*Otolaryngology*  
Mercy Hospital Pittsburgh  
Vanderbilt University Hospital Nashville Tenn.

*Pathology*

**Bureau of Legal Medicine and Legislation****MEDICOLEGAL ABSTRACTS**

**Hospitals Liability for Pneumonia and Tuberculosis Following Hydrotherapy Treatments**—The plaintiff, suffering from a common cold and entered the defendant sanatorium. She was given hydrotherapy treatments. Subsequent pneumonia and then tuberculosis developed. Attributing the conditions to the negligence of the sanatorium, she brought suit against the institution. The trial court entered judgment against her, whereupon she appealed to the Supreme Court of Colorado.

The plaintiff's complaint alleged that the sanatorium was negligent in giving her "certain hydrotherapy treatments, which treatments consisted of hot baths and hot water treatments and thereafter failing to take reasonable precautions to observe whether or not the plaintiff was thoroughly dried before placing her in an open and extremely cold hospital room." Assuming, said the Supreme Court, that the hydrotherapy treatment was negligently given, followed by a lack of precautionary measures, there remains the question as to whether the negligence was the proximate cause of the pneumonia and tuberculosis. In order to sustain a charge of negligence as a basis for a legal remedy, the court pointed out, the charge must be fortified by reasonable certainties and not left open to conjecture and speculation. Furthermore, where the record is devoid of any evidence showing a probability of proximate cause, the question is one of law for the court, not of fact for the jury. In this case the court could find no evidence from which the jury could properly have found that the hydrotherapy treatment given by the sanatorium attendant, and other acts of carelessness, were the "cause which in natural and continued sequence, unbroken by any efficient intervening cause produced" the pneumonia, and subsequently the tuberculosis. The most that could be said from all the evidence, including that of the medical expert who testified for the plaintiff, was that there was a possibility that the treatment may have been the cause. This was not sufficient. The contention that the undisputed medical evidence to the effect that it was probable for the exposure to have precipitated the pneumonia was equivalent to probable was in the opinion of the court untenable. The judgment in favor of the defendant was therefore affirmed. —O'Connor v Boulder Colorado Sanitarium Ass'n, 111 P 2d 633 (Colo, 1941)

**Criminal Abortion Conviction Under Habitual Criminal Act in Relation to Prior Pardoned Offense**—A defendant, an osteopath, was convicted in California of the crime of embezzlement and after having served his term was pardoned by the governor of that state "in order to restore his citizenship," and when subsequently, in Minnesota convicted of the crime of performing an illegal operation without prior pardon, in the opinion of the Supreme Court of Minnesota, was no bar to the imposition of a double sentence for the habitual criminal act of Minnesota.—State v. N. W. 321 (Minn 1941)

## Current Medical Literature

### AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1932 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending, but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (\*) are abstracted below.

**Physical Strain, High Altitude, Heart and Circulation**—Dill discusses cardiovascular responses to high altitudes to deficient oxygen and to the hazard of cold and the additional hazard of aeroembolism as experienced by the aviator. The responses were studied in men, women and children living on Mount Aucanquilcha in Chile at 17,500 feet who were fully or partially acclimatized to high altitudes and of the aviator who had no opportunity for acclimatization and only a short time for adaptation. Studies of the author and his party at altitudes ranging up to 20,000 feet and of Aucanquilcha workmen revealed the mechanisms of acclimatization which enable man to survive and to live a fairly comfortable life at such an altitude. The resting heart rates of men living at Aucanquilcha were low—usually between 55 and 70. Their blood pressure was within the usual limits. The most striking change was in the alkali reserve which was reduced by more than a third. The hemoglobin was increased by 50 per cent with corresponding increases in erythrocyte counts and hematocrit readings. The blood was so thick that it was difficult to draw through a 20 gage needle. The arterial blood was found to be about 75 per cent saturated. The men were somewhat dusky as in polycythemia vera. None of the party attained as complete acclimatization as the residents. Their hemoglobin increased only 25 per cent and although one to three weeks was spent at 17,500 feet comfort was never complete. Work capacity was greatly reduced. Neither could much of an oxygen debt be accumulated. The symptoms of aeroembolism that may be experienced by air crews are bends, itching, second degree formication, irritation of the throat and headache. The most serious aspect of aeroembolism is the possibility of circulatory

collapse if the cumulative effects become intolerable. At present there is no wholly satisfactory remedy. Much can be done by selecting resistant persons and by preliminary breathing of oxygen to increase one's tolerance, but this is not practical in many situations.

**Portal Cirrhosis with Ascites**—Fleming and Snell compared the results of treating decompensated portal cirrhosis by the high carbohydrate diet with various diuretic agents with those following treatment with concentrates of all the vitamins and a high carbohydrate and protein diet with sparing use of the diuretic agents. From January 1930 to January 1940 150 patients were treated at the clinic by the first and 50 by the second method. Of the 150 patients 143 received adequate treatment. Good results, characterized by a gain in strength, diminished ascites and prolongation of the expectancy of life were obtained by 44. 40 obtained fair results and 59 exhibited no favorable response but continued to become worse and died within a short time after treatment was begun. By the time the study of the 150 patients was completed 128 (86 per cent) died within a year; were dead and only 22 were living. Twelve of the 22 surviving patients were in excellent health, did not require medication or paracentesis and were living a normal life, 2 still required ammonium nitrate and mercurial diuretic agents to control the ascites, 7, although in fairly good condition, required abdominal tapping at intervals of two to four weeks, and definite information concerning 1 living patient could not be obtained. Of the 50 treated by the other method 30 were dead within four and one-tenth months and 20 were living. Of the 20 patients who survived, 11 were enjoying extremely good health, ascites had disappeared and it seemed that these patients would recover. 5 reported that they were much better and that the ascites was gradually diminishing and 4 had not improved. In these paracentesis was needed frequently, and the amount of fluid present was not altered.

**Antitoxic Escherichia Coli Serum for Ulcerative Colitis**—Winkelstein and Schwartzman differentiate ulcerative colitis due to amebic infection, that due to chronic bacillary dysentery in which chronic manifestations of the disease are maintained by the original Shigella B dysenteriae alone or in association with some secondary bacterial invaders and the indeterminate group with an unknown etiology in which Escherichia coli may play an important pathogenic role as a secondary invader. Their report deals with the serum therapy of the latter group. Altogether 70, 29 recently, cases were treated with the unconcentrated and concentrated antitoxic serum prepared according to the principles of the Schwartzman phenomenon. The serum gave good results in 75 per cent of the cases. Of the 29 recent cases 20 were greatly benefited in 2 the results were questionable and 7 failed to show improvement. In view of the encouraging results, the intramuscular use of concentrated antitoxic Esch coli horse serum (Schwartzman) is advocated for severe and intractable indeterminate ulcerative colitis.

**Diabetes Mellitus and Tuberculosis**—Mark and his associates review data on 349 patients with associated tuberculosis and diabetes who were treated at Sea View Hospital from January 1934 to December 1939. The lesions of only 40, or 11.4 per cent of the 349 patients, were minimal at the time of admission, and of these the lesions of 17 were apparently arrested or arrested at the end of the hospital stay, while the lesions of only 37 of the 107 patients with moderately advanced tuberculosis were either apparently arrested or arrested. In the far advanced group the lesions of only 19 of the 202 patients could be classified as apparently arrested. The respective hospital mortality for the three groups was 7.3, 22.4 and 43.6. The most important factor for the successful control of tuberculosis in the diabetic patient is the effective management of the diabetes. Poorly controlled diabetes predisposes to and causes rapid progression of tuberculosis, whereas the effectively controlled diabetic patient is no more subject to tuberculosis than is a normal person. The clinical course of tuberculosis was much better when protamine zinc insulin was used than when regular or crystalline insulin was employed. Pneumothorax was not as successful as in nondiabetic persons, although complications of pneumothorax were no greater in diabetic than in nondiabetic tuberculous patients. Empyema was more frequent in the diabetic than in the nondiabetic.

**Conditioned Reflex Therapy of Alcoholic Addiction**

Of 1,042 alcohol addicts treated by the conditioned reflex method during a period of five and a half years, Voegtlin and his co-workers state that 58.6 per cent are abstinent and 41.4 per

cent have relapsed. Of 142 patients observed for four or more years following the completion of treatment 44.7 per cent have remained abstinent and 55.3 per cent have relapsed.

**Treatment of Muscular Atrophies with Vitamin E**—Vitamin E in the form of alpha tocopherol acetate was given orally or subcutaneously to 11 patients with amyotrophic lateral sclerosis, 6 with progressive muscular atrophy and 4 with peripheral muscular atrophy of the Charcot-Marie-Tooth type. In general, Viets and his collaborators declare that their results, like those of many others, showed no objectively beneficial results, a few patients were subjectively better.

**Treatment of Rheumatoid Arthritis**—Smyth and Freyberg treated 28 patients who had rheumatoid arthritis with different vasodilating drugs administered by carefully controlled iontophoresis, 79 per cent were partially relieved of their articular symptoms during and for a short time after the treatment. However, few patients had significant objective evidence of improvement attributable to iontophoresis. The results in vasodilating drugs administered by iontophoresis when compared with those following other local measures of physical therapy held no advantage. Iontophoresis is a reliable way of producing localized temporary increase in circulation, but it appears to have no important advantage over the less expensive and more accessible commonly employed methods of physical therapy.

**Treatment of Tetany in Pregnancy**—Three cases of hypoparathyroidism associated with pregnancy are reported. Some of the altered clinical features encountered are described by Anderson and Musselman. In the previous literature cases have been presented. The early literature stressed the relationship of the female sex organs and pregnancy to the development of tetany. Other specific factors are mentioned: lactation, blood loss at delivery, hyperventilation and lack of intake. In previous years therapeutic abortion because of high fetal mortality and the tendency of tetany to recur in newborn infants, was considered. During the last few years the prognosis for the pregnant mother and her baby has been much better. A carefully regulated combination of intravenous calcium, solution of parathyrin and tachysterol have yielded successful results in 12 cases (including the authors' 3). Preeclamptic toxemia is

in the unsuccessful case and premature induction of labor was necessary. In their 3 cases preeclampsia occurred twice. Therefore they feel that concurrent toxemia must be watched for. Labor or delivery was not abnormal. With the therapy available today therapeutic abortion is rarely indicated.

**Renal Function in Pregnancy and Toxemia.** Taylor and his co-workers present the results of study of antepartum and postpartum renal function as determined by renal clearance using diodrast and inulin in 20 normally pregnant and 13 preeclamptic women. The renal function of the 20 normal women was not altered by pregnancy or by parturition. Placental hormones in the concentrations found in normal pregnancy are evidently not capable of affecting filtration rate (inulin clearance), effective renal blood flow (diodrast clearance) or the amount of functioning tubular tissue (diodrast Tm). Six of the 13 patients with toxemia continued to have hypertension after delivery. The antepartum clearance for certain of these patients was within the normal range but when the average antepartum figure is compared with accepted values for normal women or when the antepartum figures of individual patients are compared with their own postpartum values the trend is characteristic of toxemia. These consist in a slightly reduced filtration rate, an effective slightly raised or normal renal blood flow and a normal or slightly reduced filtration fraction. After delivery the filtration rate rose and the renal blood flow fell nearly one third resulting in a high filtration fraction. These postpartum observations are characteristic of those of essential hypertension. The other 7 patients whose pregnancies were complicated by toxemia did not have hypertension after delivery. The antepartum observations were identical with those of the preceding group. The high effective renal blood flow associated with the increased arterial blood pressure of the acute phase of toxemia is evidence against the view that renal ischemia is the primary cause of hypertension.

**Hemolytic Streptococcus Infections.**—Since the winter of 1938 Studdiford has encountered and treated with sulfanilamide 13 patients suffering from a severe but uncommon localized or spreading hemolytic streptococcus infection following abortion or delivery. All the cases occurred between early November and late May, the season when such infection is common elsewhere in the human body. Eleven of the infections occurred after abortion and two after delivery. The circumstantial evidence bears out strongly the present belief that such organisms are conveyed to the parturient genital tract from some extragenital septic focus. At first, relatively small doses of sulfanilamide were administered but beginning in 1939 the drug was given in gradually increasing quantities. During 1940 and for 1 patient in 1941 12 Gm a day has been given the dose being gradually diminished after forty-eight to seventy-two hours. Serious toxic effects did not occur. The occasional idiosyncrasy shown to the drug particularly by patients with septicemia, whose mortality if untreated is 88½ per cent, can be disregarded. Many patients have had unpleasant side reactions: cyanosis, mental confusion and nausea, which were limited to the period of treatment. One patient had a pronounced leukopenia. Most patients had an anemia, which may have been due to the infection or to the drug. Both factors probably played a part. The anemia was successfully combated by transfusion repeated as often as indicated. The uterus could be safely evacuated after forty-eight hours of adequate chemotherapy. It appears that chemotherapy might be stopped when cultures from the cervix are negative. Evidence of a bacteriologic cure is a much more efficient gauge for the length of treatment than the disappearance of fever. There were 2 deaths, a mortality of 15.4 per cent. However, if only the 8 patients with septicemia and/or general peritonitis are considered, the mortality was 25 per cent. This group is comparable to the 12 patients seen prior to June 1936, when chemotherapy was not available. 10 of whom died, a mortality of 83½ per cent. It must be borne in mind that chemotherapy may so alter the course of the disease as to produce a recurring localized peritoneal exudate which requires surgical drainage. This was the experience of 1 of the author's patients.

**Collapse Therapy in Pulmonary Tuberculosis.**—Statistics presented by Thompson and Janes show that different types of collapse therapy and proper selection of patients are important in reducing the period of treatment and enhancing the number of permanent cures. Collapse therapy, especially for patients with cavities, offers a much better prognosis than bed rest alone. Artificial pneumothorax is the treatment of choice, but if inefficient it is more of a liability than an asset. If an efficient pneumothorax cannot be established, another form of collapse thoracoplasty, should be instituted. Extrapleural pneumothorax is indicated for acute or chronic thin walled cavities surrounded by comparatively healthy lung and for adolescents with minimal lesions that progress or are stationary under bed rest alone. Extrapleural pneumothorax is often the treatment of choice when thoracoplasty is difficult or dangerous to perform. It is of little or no value in acute caseous pneumonic phthisis. Thoracoplasty is best for cavities larger than 3 cm in diameter and surrounded by caseous disease.

**Bronchoscopic Suction.**—Meyersburg and his co-workers report the influence of bronchoscopic suction on the closure of cavities of 3 patients who had had pneumothorax for six to ten months. Thoracoscopy with severance of adhesions and/or phrenic crush was previously attempted without success. Within four to eight weeks following bronchoscopic suction the unsatisfactory collapse of the 3 patients was converted to a therapeutically and anatomically satisfactory one. Clinical improvement

as shown by diminished cough, reduction in the amount of sputum, slowing of the sedimentation rate and increase in weight, was also observed. The authors found that the best time to perform suction is when the lung is not more than 50 per cent collapsed. Secretion was obtained from each patient. The procedure was also attempted on 2 patients with poorly collapsed lung in which the lobe with the cavity was adherent to the thoracic wall, the bronchoscopic aspiration here had no effect. The 3 patients are still receiving pneumothorax refills, all have a negative sputum and gastric lavage has likewise been negative. Definite conclusions cannot be made. The report should stimulate others to investigate the value of bronchoscopic suction as a therapeutic procedure in selected cases in which pneumothorax has not been entirely effective.

**Vitamin K in Tuberculosis**—Levy determined the bleeding time, the coagulation time, the prothrombin time and the hepatic function in 60 cases of pulmonary tuberculosis and in 15 control subjects in order to determine whether vitamin K had any effect on pulmonary hemorrhage. The bleeding time was not unusually high, highest values occurred in cases in which recent pulmonary hemorrhages had occurred. The average bleeding time of patients was at least 50 per cent higher than that of control subjects. The range between the highest and lowest coagulation time (four to eight minutes) of the patients was greater than that of the control group, with values between four and five minutes. The results of the prothrombin "bed-side" test of Smith and the Quick test corresponded almost 100 per cent. The "clotting power" or prothrombin time of 3 patients was below 70 per cent, of 16 between 70 and 85 per cent, of 22 between 85 and 99 per cent and of 19 100 per cent or more. About one third of the patients with pulmonary tuberculosis had a more or less definite hypoprothrombinemia. The clotting power of 11 control subjects was between 85 and 99 per cent and of 4 was 100 per cent or more. Low clotting power was most pronounced in patients with a long history of tuberculosis. The hippuric acid hepatic function test clearly demonstrated that patients with long histories of tuberculosis have a definite degree of hepatic damage. This may be secondary to toxic myocarditis or amyloidosis, both of which are not uncommon in chronic tuberculosis. More than four fifths of patients had a more or less definite degree of parenchymal damage. Although only 31.6 per cent of patients showed a definite hypoprothrombinemia, vitamin K was administered and the bleeding time, the clotting power and the coagulation time have improved as the result. The hemorrhage of the 14 patients given vitamin K during bleeding ceased immediately after one injection. None of the patients exhibited massive hemoptysis. Morphine and soluble pentobarbital had no influence on the bleeding time, while calcium and Koagamin (a sterile solution having oxalic acid as its active agent) improved the bleeding time by 7 and 18 per cent, respectively. The coagulation time was prolonged by soluble pentobarbital, slightly improved by morphine and still more improved by calcium and Koagamin. Sodium pentobarbital reduced the clotting power, and morphine, calcium and Koagamin improved it but the improvement did not equal that of vitamin K.

**Putrid Pulmonary Abscess**—Rosenbloom and Guggenheim report the results of treating a patient with putrid pulmonary abscess, complicated by a bronchopleural fistula, putrid empyema and bronchiectasis by continuous transthoracic aspiration of the abscess cavity. The method was resorted to because any more extensive surgical procedure represented too great a risk. The technic employed was that used in continuous aspiration (Monaldi method) of tuberculous cavities. The result was surprisingly satisfactory. The patient's condition improved rapidly. The empyema cavity became smaller and the bronchopleural fistula was no longer demonstrable. A small tube is maintained in the pleural cavity but discharge has ceased. The pus and sputum have been consistently negative. The identity of the aerobic and anaerobic organisms cultured from the sputum and pleural pus could not be established. Their nonpathogenicity was proved by animal inoculation. At present the patient is in excellent health, he has gained 40 pounds (18 Kg.) in weight.

**Ruptured Intervertebral Disks**—Dandy points out that there can be few more excellent results than those that accrue from intelligent surgical intervention for ruptured intervertebral disks. It accounts for an overwhelming percentage of the heretofore incurable and untreatable low back pains and sciatic mis-called sacroiliac strains, arthritis of the spine and the like. At first the lesion was localized by injecting iodized oil into the spinal canal. However, the most important advance was attained through a statistical study of the lesions. It was found by Love and by Spurling that 96 per cent of all spinal rupture disks were situated at the fourth and fifth lumbar vertebrae. This entirely eliminated the need of spinal contrast mediums for localization, but it did not alter the need for a means of diagnosing the lesion. Semmes, emphasizing the characteristic clinical picture, suggested that no spinal injections were necessary. He reported 16 consecutive operations performed on without contrast mediums or other tests in which ruptured disks were found. Three important advances have improved and greatly simplified the operative treatment. Originally a bilateral laminectomy was performed and the disk was removed intradurally. Mixter and Barr removed the disks extradurally by the bilateral approach. Semmes and also Love in 1939 reported their removal by hemilaminectomy and by removing only a notch of bone in a lumbar and Love in 1940 removed a high percentage of ruptured disks through the interlaminar space without removing any bone. Love's procedure is the acme of perfection but can be accomplished only when the variable space between the laminae is of sufficient size. A variation of this lesion, a "concealed disk" was disclosed by the author. Symptomatically there is no difference in the manifestations, but at operation the detection of the lesion is more difficult. The end results of treatment are the same. A concealed disk is one that protrudes so slightly that it can hardly be found at operation unless the subdural space is explored with great care. Furthermore, the most important reason for avoiding spinal contrast mediums is that a "concealed disk" does not show a filling defect and concealed disks make up more than 25 per cent of the total cases. The use of contrast mediums has been eliminated the author made the diagnosis sixty-three times by clinical examination alone without a single mistaken diagnosis.

**Benign or Malignant Gastric Ulcer**—The treatment of a gastric ulcer should depend on the pathologic nature of the lesion, it should be remembered that roentgenography can distinguish 10 to 20 per cent of carcinomatous ulcers from benign gastric ulcers and that there is no definite complex pathognomonic of benign gastric ulcer. Experience has shown that medical treatment during which the ulcer disappears, symptoms subside and blood disappears cannot be relied on to exclude the possibility of malignancy or that the benign ulceration will recur when the patient returns to his usual habits of life. In the last few years operation has been performed in 60 to 64 per cent of the cases of gastric ulcer and the mortality has been no greater, sometimes even less than that of ulcer. During the same period the incidence of gastric ulcer operation has been performed for duodenal ulcer.

from 15 to 18 per cent. The results of subtotal gastrectomy for benign gastric ulcer are almost perfect and superior to similar operations for duodenal ulcer. To date Walters has not seen a case of recurrent benign gastric ulcer when half or more of the stomach was removed with the ulcer. Although subtotal gastric resection is the operation of choice for almost all cases of gastric ulcer, excision of the ulcer and/or gastroenterostomy has a place. Ulceration has recurred rarely in some cases in which excision and gastroenterostomy have been performed but more frequently when excision of the ulcer only was performed.

**Gastrectomy for Duodenal Ulcer**—Surgical intervention is required by about 20 per cent of patients with duodenal ulcer. Subtotal gastrectomy according to Allen and Welch is the procedure indicated. Acute perforation accounts for about one fourth, cicatricial obstruction for one third and intractability and massive hemorrhage for the remaining operations. In this last group the palliative operations (gastroenterostomy, pyloroplasty, gastroduodenostomy, local excision and transection or gastric resection for exclusion) without removing the antral mucosa are attended with a high percentage of persistent symptoms and anastomotic jejunal ulcer. Two thirds of 67 patients had jejunal ulcer within two years after a palliative procedure for duodenal ulcer. Seventy one of 76 patients having subtotal resection survived, and jejunal ulcer has not developed thus far. Not less than half the stomach together with the pylorus should be removed when feasible. The poorest results were obtained in cases with resection for exclusion without removing the antral mucosa.

**Thymic Tumor**—The removal of a malignant thymic tumor in a case of myasthenia gravis is recorded by Poer who believes that this is the only case of the type that has been diagnosed during life. The definite improvement that has resulted adds to the growing evidence that the thymus is partly if not entirely responsible for the disease. The author's experience and that of Blalock and his collaborators would indicate that every patient suffering with myasthenia gravis should be offered the possible benefits of thymectomy regardless of the presence of a definite tumor. This is further borne out by the fact that in a total of 129 necropsies and operations performed on patients with myasthenia gravis a thymic persistent or enlarged lesion was present in 30 and a definite tumor in 41. Such a consistent observation indicates some intimate connection between the thymic lesion and the disease.

**Uremia Following Blood Transfusion**—Ayer and Gauld present 7 cases of uremia following transfusion which demonstrate the similarity of the renal changes in persons dying of post-transfusion renal insufficiency to the changes observed in deeply jaundiced infants without renal insufficiency. The only progressive renal changes were necrosis of the distal convoluted

tubules and collecting ducts and infiltration and edema of the interstitial tissue about these tubule segments. The epithelial necrosis is the determining factor in the final morphologic picture. The presence of this necrosis determines the location of the cellular infiltration of the interstitial tissue. The earliest evidence of this process is the appearance of the brick red material in epithelial cells, which is regarded as a morphologic manifestation of cell injury. The cause of the localized epithelial necrosis remains undetermined. The progressive changes and the intratubular varicose casts are duplicated in the kidneys of jaundiced infants who during life had no oliguria or renal insufficiency. Therefore it is unlikely that the morphologic renal changes following a delayed reaction to transfusion are responsible for the renal failure.

**Malignant Lesions of Stomach**—At the Mayo Clinic gastric cancer, Walters points out, is encountered three and a half times more often in males than in females. Their youngest patient was 18 years old and the oldest 88. The surgical treatment of gastric cancer presents a hopeful aspect, as 28.9 per cent (31.9 per cent when the figure is adjusted for the normal death rate) of such patients, irrespective of the grade of the cancer or involvement of the regional lymph nodes, have lived five or more years after operation. Computed on the basis of the malignant grade of the cancer, the five year survival rate ranged from 86.2 per cent for grade 1 to 23.3 per cent for grade 4. The five year survival rate and the rate of resectability among patients less than 40 years of age were high in comparison to the general average. In all age groups the rate of resectability was higher and the operative risk less in females than in males. The incidence of ulcer-like dyspepsia and the temporary effective relief of pain to a nonsurgical regimen was high among patients with gastric cancer. This indicates the danger of a differential diagnosis between benign and malignant lesions on the basis of symptoms alone. Although the roentgenologist was able to demonstrate the presence of a lesion in the stomach in 98 to 99 per cent of patients, in only 75.3 per cent was he able to designate the lesion as cancer. In 10 per cent of the patients he returned a report of gastric ulcer. About 20 per cent of the patients operated on for gastric cancer had a free hydrochloric acid content of more than 30 degrees. Precancerous lesions, chronic gastric ulcer and benign polyps should be resected. The preferable procedure for cancer of the stomach is partial gastrectomy by indirect Polya or Polya-Balfour anastomosis. Billroth I anastomosis was associated with a lower mortality rate than the Polya operation.

**Gangrene and Perforation of Gallbladder**—The high incidence of gangrene of the wall of the gallbladder which results in perforation in patients with acute cholecystitis has led Glenn and Moore to review their material in search of the mechanism involved. Defects in the supportive structure of the

intestinal tract in the presence of increased pressure, they believe, plays a part in the mechanism of perforation. The early manifestations of diverticula of the wall of the gallbladder were recognized by Rokitsky. Aschoff also considered these diverticula in the same light. These Rokitsky-Aschoff sinuses were demonstrated in 101 of 300 gallbladders removed at operation, and the gallbladders of 97 per cent of them contained stones. The association of the Rokitsky-Aschoff sinus with long-standing infection and calculi in the gallbladder and the rarity with which perforation of the wall of a gangrenous gallbladder occurs without previous infection and calculi indicates that such a mechanism may frequently be involved. Such a mechanism could account for the occasional multiple perforations of the gallbladder. Gangrene of the gallbladder is not unusual and occurs far more frequently than it is generally supposed. In eight years 84 patients with a diagnosis of gangrene of the wall of the gallbladder were encountered at the New York Hospital. During this period 350 patients were subjected to surgical treatment for acute cholecystitis. Of the 84 patients 44 were women and 40 were men, and in 59 there were symptoms of gangrene without evidence of perforation, in 22 patients there was perforation with localized peritonitis or localized abscess and there were 3 patients with free perforation into the peritoneal cavity. Two of the 3 latter patients died, whereas only 3 of the remaining 81 died. The results emphasize the advisability of the surgical treatment of a patient with acute cholecystitis. It is advisable to remove the gallbladder, provided the patient's general condition and local complications do not contraindicate the procedure. Of the 84 patients 77 were subjected to cholecystectomy, 6 to cholecystostomy and 1 was not operated on. As the differential diagnosis between biliary colic, acute cholecystitis and other acute conditions in the right upper quadrant of the abdomen is most difficult, it is probably less important than an attitude which leads to surgical intervention.

**Sarcoma of Breast**—Hill and Stout state that in the past mammary sarcoma has been divided rather arbitrarily into adenosarcoma and pure sarcoma. The latter group can be separated into specific types: adenofibrosarcoma (cystosarcoma phyllodes), fibrosarcoma, lymphoblastoma, malignant hemangioendothelioma, liposarcoma, myosarcoma and mixed tumor. Between 1911 and 1940 inclusive 15 cases of adenosarcoma, 5 of fibrosarcoma, 2 of lymphosarcoma, 2 of leukemic tumor, 2 of carcinosarcoma (?) and 2 of malignant hemangioendothelioma of the mammary gland have been recorded in the Surgical Pathology Laboratory of Columbia University College of Physicians and Surgeons. During the same period there were 1,990 cases of carcinoma. Thus sarcoma represents 1.2 per cent of all malignant mammary tumors exclusive of the leukemias. If adenosarcoma is eliminated from the malignant class, true sarcoma forms only 0.4 per cent of malignant mammary growths. All the mammary tumors appeared in females. Adenofibrosarcoma is usually clinically benign, but true fibrosarcoma arising from the ordinary connective tissue of the breast has the same malignant potentialities as similar tumors in other regions.

**Gas Gangrene and Tetanus**—Halford states that there were only 11 proved cases of gas bacillus infection at Tripler General Hospital among the casualties of December 7, although the number and type of casualties treated would have led one to expect not less than four or five times this many. Thorough debridement of wounds and dressing without primary suture largely accounted for the low incidence, perhaps the generous local and oral use of sulfanilamide also played a part. The 11 instances occurred in cases in which primary suture of the wound was performed. Almost every casualty treated at Tripler Hospital had previously had prophylactic injections of tetanus toxoid and was given a "booster" injection on or soon after the initial attack on December 7. This may account for the fact that no case of tetanus was observed. Tetanus antitoxin was given the few patients who were not definitely known to have had the toxoid.

**Toxoids in Active Immunization Against Gas Gangrene**—Kolmer studied the immunizing capacity in guinea pigs of perfringens toxoid Clostridium septicum and Clostridium oedematiens. The degree of acquired immunity was much less than that produced by immunization with tetanus toxoid against the toxin of Clostridium tetani. Immunization with the toxoid of Clostridium oedematiens was negative. Improved methods for producing and concentrating more potent toxins of the clostridia of gas gangrene for conversion into toxoids by formaldehyde may eventually make simultaneous communitization of human beings against tetanus and gangrene possible.

**Control of Tuberculosis Among Medical Students**—Weinerman and Coe point out that the average tuberculosis rate of 7 per cent in all medical schools reported by the Association of Medical Students Committee on Student Health is significantly above that for the same age group of the general population. The figures of many schools at which control efforts have been made are more reassuring. Hahn reports only a 0.2 per cent incidence at Cornell Flood cites a 0.4 per cent case rate at Columbia and equally low incidences obtained at Stanford Wisconsin, Yale and other schools with well estab-

lished health programs. Almost every nurse and student of medicine is exposed to the tubercle bacillus, as shown by tuberculin reaction statistics. Contact with tuberculous patients, lowered resistance because of poor living habits and laboratory bacilli—in the order named—are the main causative factors in student tuberculosis. An adequate control program must consist in a student health service with easily obtainable medical aid for all students, admission health certificates and physical examinations, compulsory tuberculin tests for all new students with semiannual retests, careful management of all new reactors, roentgen semiannual study of all positive reactors, prompt and complete treatment of all students with significant lesions, adequate housing, eating and recreational facilities for all students, special care in necropsy and laboratory rooms, proper precautions for sputum disposal, rigid isolation technique on tuberculosis floors, the education of the patient, nurse and medical student as to the proper control precautions and the elimination of tuberculous patients from general wards by the routine roentgen study of all hospital admissions.

**Advantages of Tuberculin Testing Surveys**—The small expense of diagnosing tuberculosis in a community or large group of persons by using the miniature film has influenced many workers to discard the tuberculin test as a screen, but Collins believes this to be a mistake, as roentgen study alone does not afford sufficient evidence for a correct diagnosis. Education is the most powerful weapon for combating tuberculosis. The tuberculin test is the best means of taking this education into the home. Total roentgen surveys sacrifice this education. A person who discovers through the tuberculin test that he is infected is much more likely to discover earlier any clinical tuberculosis that may develop subsequently than he would if the reaction were not known. The nonreactors understand that they may some day be reactors and should therefore have the test repeated each year. Often a member of a household with a history of tuberculosis discovers that he has not yet been infected, and thus unwarranted worry is dispelled. The test eliminates the serious danger of diagnosing tuberculosis in uninfected persons only by roentgen inspection thus some persons are spared a grave injustice.

**Congenital Malformations in Rats**—Skeletal abnormalities, Warkany and Nelson point out, occurred in about one third of the offspring of female rats reared and bred on a rachitogenic diet supplemented with viosterol. Similar skeletal defects were not found in the offspring of females of the same strain reared and bred on a stock diet or when the females were reared and bred on a diet which contained 2 per cent of dried pig liver and 1 per cent of calcium carbonate or only 2 per cent of pig liver. By alternately breeding the same female on different diets, abnormal and normal litters were obtained. Apparently a nutritional factor that is present in liver in large amounts is necessary for the normal intrauterine development of the rat.

**Primary Virus Pneumonitis**—Adams and his associates compared the acute primary virus pneumonitis that occurred in 74 infants in two epidemics and found a constant symptom pattern characterized by cough, dyspnea, cyanosis and low grade fever. The mortality was 20 per cent. The pathologic features—cytoplasmic inclusion bodies in the epithelial cells sloughing and proliferation of bronchial epithelium, accumulation of mononuclear exudate and patchy atelectasis—found in the lungs in fatal cases were uniform. These features were not seen in 20 control cases of pneumonia in infants caused by the usual bacteria. Eighty-five per cent of the throat smears from infants with pneumonitis were positive for inclusion bodies, whereas less than 10 per cent of infants and adults in five control groups showed inclusion bodies. Fairly extensive biologic studies on the virus of pneumonitis have failed to isolate the agent. The prematurely born infant is the most susceptible host. The susceptibility of all postnatal infants contraindicates further institutional care of well babies whenever the disease is prevalent. No specific therapy has as yet been developed, but oxygen, postural drainage, aspiration of exudate, blood transfusion and the sulfonamide drugs (to combat secondary bacterial infection) have appeared to be efficacious in some cases. Whole adult blood may have prophylactic value, especially for the premature infant.

**Scarlet Fever Immunization**—Jacobs and Orris used scarlet fever streptococcus toxin in vials in graduated doses (500, 2,000, 8,000, 25,000 and 80,000 to 100,000 skin test doses) to immunize infants and children with positive Dick tests attending their clinic. The toxin, 0.1 cc, was given intracutaneously into the skin over the thigh. Alternate thighs were used for the injections, which were of a stronger dilution. The intervals between injections were two, three and four weeks. The patients were immunized to the point of a negative skin test and were then periodically tested for as long as four years. Of 250 infants and children immunized, 187 were followed for a sufficient time to obtain accurate records of the course of their immunity. After the last injection 144 of the 187 children returned within three months for their first Dick retest and the remaining 43 within three to eighteen months. There were 100 (69.4 per cent) negative reactors at the end of three months. Of 33 retested after three to six months 26 (78.8 per cent) reacted negatively. The 24 who on the first retest had positive Dick reactions were given an additional injection of 9,000 skin test doses, and 6 of the 7 retested three months later reacted negatively. All the 37 children Dick tested two to four years after the last injection reacted negatively, as did 13 of the 14 who were given an additional injection of 9,000 skin test doses. Eight hundred and seventy-five injections were administered, and of these 730, or 83.4 per cent, were not followed by a reaction. Five of the 53 children who had reactions had nine severe reactions, 12 had fourteen moderate reactions and 36 had one hundred and twenty-two mild reactions. In this last group the vague complaints of irritability and restlessness the night of the injection, or itching, soreness or pain at the site of injection followed each injection.

**Unilateral Renal Ischemia and Hypertension**—Wilson and Chamberlain report the occurrence of atrophic pyelonephritis with hypertension in a girl of 12 who complained of frequent right temporal and occipital headaches and partial blindness for one year and whose blood pressure on admission was 230 systolic and 170 diastolic in the right and 210 systolic and 160 diastolic in the left arm. For ten days following admission the patient was kept at bed rest and given phenobarbital at regular intervals. During this time the lowest blood pressure obtained was 190 systolic and 130 diastolic. Several vasopressor tests failed to influence the blood pressure. Nephrectomy was performed. The pathologic changes in the specimen were similar to those seen in experimentally induced hypertension in dogs. The microscopic renal changes, especially the arteriolar changes, were in complete accord with the experimental observations of Goldblatt. The retinal changes also closely approximated the pathologic changes in the retina of the hypertensive dog. The severity of the vascular damage was demonstrated not only by the changes in the fundus of the eyes but also by the fact that a cerebral accident occurred some months before, as indicated by the history and by residual weakness of the facial muscles. Sclerotic changes involved large arteries and arterioles, as evidenced by thickening of the radial arteries. It seems safe to assume that arterial changes were widespread throughout the body. The involvement of the large arteries lends support to the theory that hypertension itself will produce secondary vascular changes if present for a long time and that renal ischemia is associated with sustained hypertension. During the last twelve months it has been obvious in this case that although the improvement in the retinal vessels has been striking, definite residua will be permanent. The remaining arteriolar changes represent irreversible pathologic changes. In all probability similar irreversible changes are present in the remaining kidney. The authors feel that this explains the remaining blood pressure of 120 systolic and 80 diastolic. The case emphasizes the fact that this particular patient would have had more benefit from earlier surgery.

**Peripheral Ligations in Relation to Blood Pressure**—According to the experiments performed by Allen on the dog it appears that this animal is apparently subject to a higher degree of psychic or nervous hypertension than man. The degree of ligations of various parts of the body, duplicated in the previously obtained with the kidney, confirm the interpretation that the phenomenon is not humoral or specific to the kidney but is purely nervous in character. A strong psychological component is obvious in all the experiments with ligation or clamping of the kidneys, testes, legs, tail and ears, but the occurrence of an elevated pressure under mild anesthetic conditions and psychic quietness indicates an additional nervous component. The experiments show that the rise of pressure after prolonged ligation of an organ may sometimes be matched by ligation of the tail.

in which case it is evidently a nervous response to the painful local inflammation. As acute hypertension from ligation of organs or from simple excitement occurs in epinephrectomized animals, the adrenals are apparently not concerned in the process.

**Malignant Testicular Tumors**—Pathologic material was available for study from 21 of the 26 patients with malignant neoplasms of the testis seen at the Peter Bent Brigham Hospital from 1913 to 1939. The series was representative of all the commonly recognized tumors arising in this location as well as teratoma testis with single tridermal metastasis and a chorion epithelioma with associated hypertension. According to Adams data from the study lend support to the theory that these tumors including seminomas and chorionepitheliomas probably are of common origin. It is held that they arise from a spermatogenic cell or cells. Such cells may be pleuripotential and give rise to tridermal metastasis. A case with single tridermal metastasis, each containing derivatives of all three germ layers is cited as evidence for such an occurrence. It is suggested that trophoblastic tissue is present in teratoma testis more often than is commonly supposed and that its presence accounts for the large amount of gonadotropic substance in the urine of a patient with such a tumor.

**Acute Appendicitis and Typhoid Inoculation**—Immediately after each new increment of troops was inoculated against typhoid at Fort Leonard Wood, Mo. Bowers and Shupe noticed that there was an influx of patients with acute appendicitis. While most of the cases subsided spontaneously under conservative management, 8 patients have come to appendectomy. The time relationship between the inoculation and the development of acute appendicitis was so striking that they investigated the situation and concluded that acute appendicitis on the basis of luminal obstruction by swollen lymphoid tissues was not a rare sequela of typhoid inoculation. They urge that all patients who complain of abdominal pain after such an inoculation be watched and that those in whom the pain accompanied by rebound tenderness becomes localized to the lower right quadrant be subjected to appendectomy. It is to be understood that the value of typhoid inoculation outweighs the danger of appendicitis.

**Meningitis Treated with Serum and Sulfonamides**—Kasich and Shulman state that 6 of 13 patients with meningitis admitted to the Station Hospital Fort Dix, N J, between Dec 29, 1940 and July 14, 1941 were treated with serum intrathecally or intravenously and with chemotherapy. At the daily spinal puncture 40 cc of fluid was removed and 15 to 30 cc of

antimeningococcus serum was injected by gravity into the spinal canal. This was continued until the cell count and the sugar content of the spinal fluid returned to normal. Sulfanilamide was given concurrently, 2 Gm for the first dose and then 1 Gm every four hours for seven days after treatment with serum was stopped. The patients who received intravenous treatment were given 90 cc of serum twice a day diluted in 200 cc of isotonic solution of sodium chloride. Serum reactions caused this method to be discontinued after a few injections and to continue with the sulfonamide medication alone. Of the 7 patients who received only chemotherapy, 6 received sulfanilamide, 2 Gm for the first dose and 1 Gm every four hours thereafter. When the temperature and the spinal fluid became normal chemotherapy was continued, 1 Gm every eight hours for five days. Spinal taps were done for diagnosis only. One patient was treated with sulfapyridine, 4 Gm for the first dose and 1 Gm every four hours thereafter. After the temperature was normal for four days a maintenance dose of 1 Gm was administered every eight hours for seven days. All the patients recovered, 3 had complications and 2 sequelae—1 partial left ear deafness and 1 weakness and loss of power of the left shoulder caused by a peripheral neuritis. The patients who were given chemotherapy alone had fewer unfavorable reactions and complications. In 11 of the 13 the diagnosis was definitely established on admission by finding gram negative intracellular diplococci in the spinal fluid and confirmed by culture and in 2 the spinal fluid under increased pressure, was turbid and contained a large number of cells, 100 per cent of which were neutrophils.

**Treatment of Trichophyton Foot Infection**—Rademacher commander of the Ninth Army Corps suggested treatment of trichophyton infection with sodium sulfathiazole. In a battalion of 570, there were found 75 cases of trichophytosis ranging from a mere scaling with slight fissures to macerated swollen feet with large fissures and crusting. Half of the group were treated with pure sodium sulfathiazole crystals dusted on the lesions daily and half with 50 per cent sulfathiazole in talc. The condition of practically all the patients was definitely improved within forty-eight hours. Thereafter half of the patients were treated with 50 per cent and the other half with 25 per cent sulfathiazole in talc. The results in the two series were equally good. Smaller percentages (5 to 10 per cent) of sulfathiazole would probably be equally effective. There is available a commercial product of 5 per cent sulfathiazole in a bland ointment that is satisfactory. Treatment must be controlled for if left to the patient it is not thorough and regular. All infected areas must be covered with a film of the powder. Criteria of cure were healing of all lesions and disappearance of all adherent cutaneous debris. Of the 75 patients 22 were cured within ten days, 9 were lost to follow-up from causes beyond control and 44 after being treated for a short time and obtaining much improvement responded no further. These patients were further treated with 10 per cent of powdered sulfathiazole in a 2 per cent salicylic acid ointment. The length of treatment varied from two weeks to a month. Five were lost to follow-up, 33 were cured and 6 are still resistant. If the 14 patients lost to follow-up are not considered, 55 or 90 per cent of the 61 remaining patients, were cured.

**Transfusion Reaction and Erythroblastosis Fetalis**—Aagaard reports 2 transfusion reactions which were probably due to the Rh factors in the transfused blood. To prevent such reactions, special studies (the agglutination test of Wiener

and Peters and the biologic test for blood compatibility) are indicated when any medical, surgical or partial or postpartal patient with blood dyscrasias, chronic blood loss or a history of obstetric complication requires repeated transfusions. A list of Rh negative donors should be available in every obstetric service.

**Removal of Iodized Oil from Spinal Subarachnoid Space**—The Kubic and Hampton method of aspirating iodized oil from the spinal subarachnoid space was used successfully by Jueis and Peterson in 13 of 17 cases. The method consists in aspirating the oil through the same spinal puncture needle through which it was injected. Although the procedure is basically simple, attention to the following points are essential for a successful aspiration: 1. The site for the puncture is best determined fluoroscopically. 2. The needle must enter the dural sac as close to the midline as possible. This position should be checked fluoroscopically before the oil is injected. 3. Multiple punctures must be avoided. 4. Suction with a small syringe (2 to 5 cc) must be extremely gentle if sucking a nerve root or a piece of membrane into the needle is to be avoided.

**Erythroblastosis Fetalis**—Buhler and his associates report the occurrence in dizygotic twins of the triad icterus neonatorum, hydrops fetalis and congenital anemia, heretofore considered as separate entities but now as fetal erythroblastosis. The theory of the Rh factor as the cause of the disease was confirmed by a study of the blood of the mother, the father and the twins. The father's blood was Rh positive, the mother's Rh negative and the infants' blood Rh positive with both guinea pig immune serum and human serum. The diagnosis at necropsy on both infants was fetal erythroblastosis. Of the mother's seven previous pregnancies (the first, one of the second and the fifth) only 3 children are living. 1 of these is one of twins. The other of these twins died two hours after birth. The third pregnancy resulted in a stillborn fetus with petechial hemorrhages of the pleura and epicardium, visceral congestion and extensive post-mortem autolysis. Erythroblastosis was suspected. Two years later a spontaneous abortion of a 3 month fetus occurred, at the sixth pregnancy two years later a 10 inch macerated fetus (following this delivery the mother was in severe shock and a transfusion of the husband's blood was attempted but after a few cubic centimeters were given chills, urticaria and purpuric lesions developed, she recovered on emergency treatment) was delivered and a year later she had an incomplete abortion, followed by dilation and curettage at eight weeks.

**Treating Malaria by Short Course Method**—Sanders discusses his experience with quinine and quinidine in the treatment of malaria from 1930 to 1940 inclusive. By 1935 he had treated 1,047 cases of malaria with quinidine alone. Until July 1933 the treatment consisted of four single daily doses of 10 grains (0.65 Gm). Then it was increased to five days with two doses (10 grains) the first two days. A statistical study disclosed 74 per cent one, 78 per cent two, 68 per cent three and 86 per cent four year cures, or a combined rate of 75 per cent. Eighty-one patients were treated with quinine, 7 with hydroquinine, 48 with cinchonine and cinchonidine, 7 with hydrocinchonine and hydrocinchonidine and 56 with atabrine. Of the patients treated with atabrine 37 per cent relapsed, this is comparable to that of quinine and quinidine. The other cinchona alkaloids, although only a few patients were treated with each, confirmed previous reports of their efficacy. During 1937, with the cooperation of thirty-two physicians, a comparison of quinine and quinidine in the treatment of 1,138 cases was made. From 10 to 20 grains (0.65 to 1.3 Gm) of quinine daily was as effective as 30 to 40 or 60 to 90 grains (2 to 2.6 or 4 to 5.8 Gm). The five day course of quinine was as effective as the longer course, that is, fourteen days with 10 grains two nights a week for the rest of the season. The relapse rate of quinidine was 15 per cent in benign tertian and 13 per cent in estivo autumnal malaria, while with quinine it was 20 and 30 per cent respectively. The author believes the short course of therapy is preferable to the long, as it allows a few parasites to remain in the body and immunizing substances to develop. Idiosyncrasy is about as common with quinidine as with quinine, 6 instances occurred among the 2,215 patients. This observation bears out the ratio ordinarily expected with quinine, 1:300 to 1:500. No patient has been sensitive to both quinine and quinidine. Women in all stages of pregnancy tolerate quinidine well. Quinidine probably does not cause amblyopia as quinine sometimes does. Patients in whom hematuria was caused by quinine have tolerated quinidine with no recurrence of the hemorrhage. Seven patients have been treated with sulfanilamide and sulfapyridine, 2 did not respond readily and were put on quinidine. Of the thirty or more cinchona alkaloids, most of them have antimalarial value. Treatment with atabrine should not be repeated in less than two months. There is a strange similarity between all the antimalarial drugs in that they "cure" 65 to 75 per cent or better. The acute cerebral or comatose type of malaria is probably best treated with quinine hydrochloride (15 to 30 grains) given as an infusion, and repeated if necessary. Frequently the patient with hemorrhagic malaria or blackwater fever, another difficult type to treat, has taken some quinine and it is advisable to switch to the other drug—quinine to quinidine or vice versa.

In no instance in a change from one drug to the other has the blood not been freed from parasites. For chronic malaria the author has found it best to give short courses (three) of treatment with ten to fifteen days of rest in between. Complications of pregnancy or deafness are better treated with quinine.

**Renal Damage Following Use of Sulfathiazole**—Burch and Winsor report 2 cases in which renal complications developed following the use of sulfathiazole. This brings the total to 31 cases but they do not believe that this represents the total number of patients who have sustained renal damage from its use. The diagnosis of renal damage from sulfathiazole is not difficult if the patient has been properly studied before and during treatment. Hematuria, oliguria, backache, renal colic, tenderness over one or both kidneys, progressive nephromegaly, decreasing renal function and azotemia in a patient receiving sulfathiazole should make one suspect renal damage. The presence of one of the changes alone or any combination of them is sufficient for a tentative diagnosis. If renal function is determined daily renal damage can be detected early. The prevention of injury to the kidneys by sulfathiazole is not difficult if certain rules are followed: the determination of previous treatment with any one of the sulfonamide drugs, evaluation of the patient's renal function and the nature of the urine being excreted before therapy, the determination of the patient's fluid balance before therapy and the correction of dehydration if such exists, the administration of alkalis, the maintenance of an alkaline urine and the determination of idiosyncrasy to any one of the sulfonamides. The drug should be stopped immediately once the slightest evidence of renal injury is discovered. Fluids should be administered in large quantities. The pelvis should be catheterized and the catheters should remain in place until a normal urinary flow has been reestablished. Irrigation will relieve ureteropelvic obstruction but will have no effect on tubular obstruction. The latter should be treated by an intense diuretic regimen.

**Infectious Syndrome Resembling Influenza**—Since the spring of 1940 Salzman has seen an infectious disease, both endemic and epidemic, probably due to a virus which resembles influenza but with certain definite characteristics that allow it to be differentiated from influenza. In addition to the picture of a general systemic infection, pulmonary and neurologic involvements may occur. The diagnostic characteristics are the leukocyte count, which shows a definite elevation during all stages of the disease. The count varies from 13,000 to 27,000 even in afebrile cases. Three types of the disease may be recognized:

the influenzal, the pulmonary and the neurologic. The influenzal type is most frequent. The onset is usually sudden, frequently without cough and sometimes with a slight sore throat. Nasopharyngitis is common. The temperature is rarely above 100 F. in the sporadic case, but in the epidemic case it is usually 102 to 103 F. The symptoms of generalized infection—malaise, exhaustion, backache and generalized aching—are frequent. Occasional soreness and localized edema of some group muscles, especially of the forearms and legs is not rare. After the acute phase of the infection subsides the patient may have no pains, but he complains of persistent and intense fatigue. The pulmonary type is similar to the influenzal group except that the lungs are involved. The neurologic type may be difficult to diagnose and, in occasional instances, may lead to abdominal intervention. Patients complain of severe lancinating but temporary pains in various parts of the body. The skin over the involved area is always hyperesthetic. These patients usually give the typical history of the acute phase of the infection some weeks before seeking medical advice. The onset of the neuritic pains (which occur in about a third of patients) can be traced back to a week or ten days after the onset of infection. Despite the fact that the sulfonamide drugs have thus far not been found to be of value in virus diseases, they have been almost specific for this group of patients. Sulfadiazine and sulfathiazole 1 Gm. repeated in one hour then 1 Gm. every four hours for twenty-four hours, then 1 Gm. every six hours for forty-eight hours, have been equally satisfactory. Thiamine hydrochloride, 10 to 15 mg. hypodermically every day was of considerable value for relieving the neuritic and neuromuscular pains. There was no mortality or serious pulmonary complication among 30 patients seen in the last eighteen months. A few were seen during the summer and early fall when influenza was not present.

**Immunization with Inactive Virus of Influenza B**—Human volunteers from 20 to 30 years of age were given subcutaneous injections in the left arm of 1 cc. of influenza B vaccine and in the right arm of 1 cc. of the complex influenza A distemper vaccine of Horsfall and Lennette. The neutralizing antibody titers of acute and convalescent serum specimens obtained about two weeks apart from 70 influenza patients were compared by Eaton and Martin with prevaccination and postvaccination serum specimens from 63 persons receiving the influenza B vaccine. The influenza patients showed greater increases in antibodies than did the vaccinated persons. This effect was related to the differences in initial antibody titers of the vaccinated and infected persons. The antibody levels two weeks after infection or vaccination roughly indicate that, as far as circulating antibodies are concerned, the response resulting from vaccination with influenza B virus treated with formaldehyde is similar to that resulting from infection. The increase in complement fixing antibodies after vaccination was less definite than the response to infection. The prevaccination and postvaccination antibody titers against influenza A and B show that some individuals showed a decided increase to influenza A but little or none to influenza B, while the reverse was true of others. Because of the present uncertainty as to the role of circulating antibodies in immunity to viruses, claims for effectiveness of any vaccine should not be based on considerations of antibody response. The results indicate that allantoic fluid preparations of the virus of influenza B treated with formaldehyde have a relatively high antigenicity as judged by the production of neutralizing antibodies.

**Infectious Mononucleosis**—Atypical and protean symptoms of infectious mononucleosis or glandular fever are not unusual and are frequently confused with some other more serious condition. Leavell and McNeel present 8 of 57 cases in which unusual manifestations were encountered. Diagnosis often cannot be established for a few days, the difficulty usually being due to the fact that infectious mononucleosis is not considered. If the disease is suspected, the characteristic blood picture and positive heterophil agglutination, which are generally present when the patient first consults the physician, are clearly diagnostic. Infectious mononucleosis should be considered in all patients with unexplained fever, Vincent's angina, atypical influenza, any glandular enlargement and unusual forms of encephalitis and lymphocytic meningitis. It should also be considered in patients with unexplained lymphocytosis, false positive Wassermann reactions, jaundice and unexplained abdominal pain.

**Mumps as Military Disease and Its Control**—Wesselhoeft and Walcott recommend four steps to be carried out when a case of mumps occurs in any military establishment. 1 The patient should be closely questioned as to when and where he might have acquired the disease, it being borne in mind that the average incubation period is eighteen days. If others in the command were simultaneously exposed they should be immediately placed under observation in separate detention. 2 The patient should be isolated. His equipment should be thoroughly aired in the sunlight or handled as facilities permit. 3 Arrangement should be made for the isolation of the unit. Contacts need not be detained separately until twelve days after the diagnosis of the original case. It is desirable to keep each

contact on separate detention for ten days, that is from the twelfth to the twenty-first day after exposure. This prevents further spread. 4 Convalescent serum, 20 cc into the gluteus muscle, should be given as soon as possible to those with negative histories and, if the supply is sufficient, to those with questionable histories. The early eradication of mumps in a unit of a large command is of utmost importance, because once an epidemic gains headway control is difficult, for example, in the last war the epidemic at Camp Wheeler comprised 5,756 cases. The medical officer in the hospital receiving patients with mumps should collect blood on the day of the patient's discharge for convalescent serum.

**Electroencephalogram and Flying**—In comparing the flying ability of 55 student fliers and 54 pilots with the electroencephalographic observations, Thorner and the Gibbss find that flying ability can be correlated with (1) the distribution of energy in the right occipital spectrum, (2) the dominant frequency and character of the control electroencephalogram (ink record) and (3) the amount of slowing that occurs with over ventilation. The data suggest that if correct criteria are used it may be possible to select a superior group of candidates for flying instruction, with a resultant reduction in the proportion of failures and an increase in the proportion of superior fliers.

**Sulfanilamide for Acute Rheumatic Heart Disease**—Davis states that the cardinal signs and symptoms in 7 cases of acute rheumatic carditis disappeared early and rapidly and remained so when sulfanilamide was administered early and repeatedly. The rheumatic manifestations did not seem to be intensified when sulfanilamide was given at the beginning of the carditis. The articular involvement in 1 case cleared completely. Sulfanilamide started early may have prevented the state of sensitization or counteracted the formation of toxins. The author agrees with Hedley that rheumatic carditis should be regarded as the chief manifestation and not as a complication of rheumatic fever, and that acute rheumatic fever is a systemic disease with articular involvement a secondary toxic reaction.

**Tuberculous Stricture of Bronchus**—Durkin and Vinson report the favorable outcome of a tuberculous bronchial stricture treated by high voltage roentgen therapy. When the patient, a woman of 30, was examined almost five years later she was completely free from pulmonary symptoms and had gained 35 pounds (16 Kg). Physical and roentgen studies revealed a small amount of fibrosis in the upper lobe of the left lung without evidence of bronchial occlusion. Bronchoscopy was not recommended.

**Immunization Against Diphtheria**—Fulton and his colleagues discuss the immunity judged by the Schick conversion rate produced in children inoculated with 0.1 and 0.3 cc of alum precipitated toxoid at intervals of four to six weeks. They have inoculated approximately 30,000 school children against diphtheria during the last two years. A proportion of the children were Schick tested before and after inoculation of 2,751 boys 74.5 per cent and of 2,150 girls 83.1 per cent reacted positively. The intensity of the Schick reactions did not appear to be affected by the age of the child. Pseudoreactions were observed in only 1.2 per cent of subjects. Approximately half of the children inspected for local tissue reaction showed some degree of reaction after inoculation. Local reactions were more common among Schick negative than in Schick positive reactors. Constitutional reactions following inoculation could not be observed. To determine whether the immunity conferred by the 0.1 and 0.3 cc doses was lasting the children

of two schools that had been Schick tested before and after inoculation were retested thirteen months after the second dose of alum precipitated toxoid 97.7 per cent of them were Schick negative. Further tests on the children of seven schools who had never been Schick tested showed that of 966 children Schick tested twelve months after their second inoculation 91.3 per cent were Schick negative. Two thirds of the positive reactions were trivial; many would probably have been regarded negative by less exacting observers. There was no diphtheria in any of these schools after inoculation and practically none in the whole town. Provided only preparations of alum precipitated toxoid of guaranteed potency are issued, inoculations of 0.2 cc and then 0.3 or 0.5 cc at an interval of not less than four weeks should provide an adequate degree of immunity against diphtheria without weakening the success of the immunization campaign by the occurrence of unduly severe tissue reactions. The optional increase of the second dose to 0.5 cc is suggested mainly to widen the margin of safety if the alum precipitated toxoid has not been stored in the refrigerator or is nearing its expiration date. For routine purposes children should be immunized with two doses at the age of 1 year, and then a single dose of 0.3 to 0.5 cc to stimulate their waning immunity on entering school at 5 years, and again at the age of 10. Preimmunization Schick tests are rarely called for, but Schick tests two to four months after inoculation serve as a useful control to the efficiency of the method employed.

**Sulfapyridine in Ophthalmia Neonatorum**—From September 1939 to January 1942 322 cases of neonatal ophthalmia were treated by Sorsby and his co-workers. Of the total 273 were treated with sulfapyridine by mouth and 49 by local medication. Sulfapyridine was used irrespective of the causal organism, and clinically there appeared to be no obvious specially selective action on gonococci. The contrast shown by the results obtained with sulfapyridine is striking: 61.9 per cent of patients were cured clinically within eight days by sulfapyridine as against 15.2 per cent by local methods and respectively 5.9 per cent required prolonged treatment of more than thirty days as against 26.1 per cent. Surprisingly there were as many rapid recoveries of nongonococcal as of gonococcal infections with sulfapyridine. Sulfapyridine is regarded as a specific against the gonococcus and feebly active against the staphylococcus and most of the other common organisms of ophthalmia neonatorum.

**Allergy, Enuresis and Stammering**—A history of allergy in the child or his family was obtained by Gordon in 85 (65 per cent) out of 128 bed wetters as compared to 28 per cent in 200 control children. Likewise there were 70 children who stammered, and of these 46 or 66 per cent had a personal or family history of allergy. The control figure for the 200 children was again 28 per cent. It is suggested that, among the manifestations of allergy, migraine is largely associated with enuresis and stammering and that headaches of various types may be a factor in the etiology. This being the case, and the fact that nightmares are common among allergic children, enuresis and stammering are not themselves direct allergic manifestations but result from the abnormal psychologic traits common to allergic persons.

**Chronic Meningococcal Bacteremia**—The clinical symptoms and physical signs of the 5 cases of chronic meningococcal bacteremia that occurred in a hospital ship between January 1940 and July 1941 Clarke points out, agreed well with the descriptions in the literature reporting cases occurring in the present war. Pain, fever, cutaneous spots and a palpable spleen were present. Signs of meningeal involvement were not

observed, but the pressure of the cerebrospinal fluid in 1 case was increased, although it was normal cytologically. The diagnosis in 2 cases with a positive blood culture was simple, the clinical picture and response to treatment in 1 case of tertian fever were so characteristic that no doubt was entertained, 1 patient was under observation for so short a time that dogmatic statements were not possible (he was admitted within three weeks from the same station as the patient with the tertian fever and all evidence points to the diagnosis being correct) and in 1 case subacute rheumatism was considered in the differential diagnosis but the length of the illness, the absence of articular swelling and cardiac signs and failure to respond to salicylates militated against a diagnosis of rheumatism. Sulfapyridine produced dramatic results in 2 cases, definite improvement occurred in 1 and in 1 the symptoms returned when the dose of the drug was reduced, but recovery ultimately occurred.

 Diphtheritic Diaphragmatic Paralysis Treated in Box Respirator J M Todesco—p 261

**Physiologic Effects of Blast**—The mode in which blast lesions occur and the effect that blast has on the cardiovascular system, on the respiratory mechanism and on cortical activity in rabbits are discussed by Krohn and his colleagues. In the experiments the trunks of the rabbits were protected while their heads were directly exposed to high blast pressures. The changes observed confirm earlier observations that thoracic and abdominal lesions which result from blast are due to the wave acting on the surface of the body and not to the pressure or the suction components of the wave acting through the nose and mouth. The thoracic and abdominal lesions are primarily due to the impact of the pressure component on the wall of the body. The lesions can occur when the suction component is excluded. Electrocardiographic records show that the heart beat in blasted animals is coordinate. The electrocardiograms of animals which survive high blast pressures may show a transitory anoxemia. Animals exposed to blast show an immediate fall in arterial blood pressure related to the peak of the pressure anoxemia. Animals exposed to blast show an immediate fall in arterial blood pressure related to the peak of the pressure experienced. There is a slight maintained fall in venous pressure. These "shock" symptoms are not due to vagal inhibition. The falls in pressure can be regarded as a "shock" effect of pulmonary or extrapulmonary trauma, but the changes in the systemic blood pressure can be explained as secondary to changes in the pulmonary blood flow. The reserve of the capillary bed is reduced, and the danger of a rise in the pulmonary arterial pressure and of pulmonary edema as a result of increased venous return is greater. The respiratory rate of rabbits which survive exposure to blast is prolonged and increased. When the lung is so severely damaged that whole lobes are consolidated, respiration is extremely labored because of changes in the elastic recoil of the lungs. Animals exposed to high blast pressures are not concussed. Immediate death unassociated with external trauma appears to be due to "shock" following internal injury, sometimes it is associated with occlusion of the larger air passages by blood clot. Delayed death is generally due to pulmonary edema but sometimes to intraperitoneal hemorrhage. Treatment should avoid overtaxing an already diminished pulmonary capillary reserve. Oxygen, morphine and venesection may be beneficial, while transfusion, general anesthesia and exertion are contraindicated.

**Perforated Peptic Ulcer**—Stewart and de R Winsor obtained figures for 1937-1940 from sixteen London hospitals and discovered a statistically significant increase in perforated peptic ulcer during the first heavy air raids of September and October 1940. The probable cause for the increase was anxiety. Of the perforations for the four years, 93 per cent were in men.

The ratio of gastric to duodenal perforation was 16:1. The peak incidence was in those aged from 50 to 60, this is in contrast to the peak between 20 and 40 in the September and October 1940 series. There was no significant change in age, sex or site among perforations in the air raid period. The monthly average for the four years was 25, excluding September and October 1940 it is 23, whereas in these two months it was 64.

 Methyl Chloride Poisoning A M Jones—p 29  
 Pregnancy and Diabetes R D Lawrence and W Oakley—p 45

**Effect of Liver Therapy on Erythropoiesis**—The changes that Davidson and his colleagues observed in films prepared from sternal marrow obtained from patients with pernicious anemia before and at various short intervals after liver therapy was instituted are presented. Within six to ten hours of the initial injection of liver extract the mean size of the nucleated erythrocytes is reduced, the nucleus stains deeper and the chromatin strands appear irregular and lumpy. The frequency of cell type II increases at the expense of type I. The predominant cell of this type has a basophilic cytoplasm, the principal feature that distinguishes it from type I is the nuclear change. This change is not accompanied by any increase in the percentage of mitotic figures that is commensurate with the decided change in the appearance of the bone marrow picture. No definite evidence of amitotic division was observed. After thirty-two to seventy-two hours type I cells become relatively infrequent and the picture is dominated by small type III cells, usually with a polychromatic cytoplasm and a small, relatively dense nucleus, the megaloblastic picture has by now become normoblastic. Again no significant increase in mitotic figures is seen. The low incidence of mitotic figures and the definite cellular changes would seem to support the theory that the maturation is a direct physicochemical process due to the action of the liver extract rather than the result of cellular mitosis. There is no proof of the existence of such a process. It is also possible that the frequency of cells seen in mitosis is due to the rapidity of the cytologic changes, so that only a small number may be recognizable at any given moment. This contention is supported by the finding of only a small percentage of cells in division in the bone marrow five to six days after liver therapy was begun, when many reticulocytes were present in the peripheral blood, indicating a decided activity of the bone marrow. The rapidity of the change in the bone marrow from a megaloblastic to a normoblastic picture supports the view that normoblasts can be derived directly from megaloblasts. Differential counts of erythroblasts on sternal marrow films obtained from patients with severe untreated nutritional deficiency anemia and hemolytic anemia give figures comparable to those obtained in cases of pernicious anemia three days after the institution of liver therapy. Under conditions of prolonged and severe strain a reversion of the normoblastic to a megaloblastic blood picture may occur. If this is correct it supports the thesis that megaloblasts and normoblasts belong to one developmental series of cells.

- Focal Infection and Allergy O Meyer—p 10
- Etiology of Torsion Fracture of Leg During Skiing F Jakob—p 12
- \*Gonococcal Arthritis Treatment and Cure by Sulfathiazole U Thiry—p 13

**Clinical Evaluation of New Chemotherapeutics**—Löffler and Hegglin point out that the new chemotherapeutics is being further investigated because so far no preparation has been found which is entirely free from undesirable secondary effects and because certain pathogenic micro organisms are inadequately influenced by the available drugs. In view of the excellent results obtained so far the introduction of new ones will be justified only if they surpass or at least equal the ones now available. New compounds will be expected to produce the same therapeutic effect with less undesirable secondary effects and with greater therapeutic action. The action and the secondary effects of the available chemotherapeutic agents must be thoroughly understood if new ones are to be properly evaluated. The authors present a comparative evaluation of sulfapyridine and sulfathiazole on the basis of 511 cases of pneumonia. These two preparations have reduced the mortality rate of pneumonia to such an extent that further improvement can hardly be expected. While sulfapyridine is somewhat more effective in the reduction of fever sulfathiazole has the advantage that its effect on the blood system is less harmful. The authors describe their observations with N-dimethylacrylsulfanilamide which is known also under the term *organon*. They used this new preparation in 10 cases of acute pneumonia and found that its clinical effect is inferior to that of sulfathiazole whereas its undesirable secondary effects particularly on the blood system are greater.

**Sulfathiazole in Gonococcal Arthritis**—Thiry reports the history of a dancer aged 24 who twelve days before hospitalization had become ill with sore throat and a feeling of stiffness throughout the body, particularly of the neck. A tuberculous or gonococcal spondylitis was suspected. A strongly positive gonococcal reaction established the diagnosis. Treatment with sulfathiazole was instituted and proved successful. Inquiry revealed that the patient's occupation played a part in the localization of the lesion because eight days before the dancer became ill forced extension of the right leg on the back had been done in the course of training. The author thinks that slight traumas may favor the localization of the gonococcus in the hip joint of a dancer. Roentgenograms taken at various stages showed the extent of regression of osseous lesions.

**Hutchinson's Teeth**—De Alzaga and Sundblad studied dental anomalies in children with congenital syphilis. They gained the impression that not all of the characteristics of Hutchinson's teeth need necessarily be combined. Bilaterality may be absent as is indicated in one of Hutchinson's own reports. The defects are not necessarily limited to the permanent teeth. While the majority of authors who have studied Hutchinson's teeth deny their occurrence in the first dentition, there are some, including the authors themselves who have observed them in the deciduous teeth. The frequency of Hutchinson's teeth in hereditary syphilis varies according to different investigators. The authors encountered dental anomalies in 51.21 per cent of 125 children in whom heredosyphilis

was certain or highly probable, though only 6 had typical Hutchinson's teeth. It is necessary to differentiate Hutchinson's teeth from the lesion that is characterized by the physiologic corrosion of the enamel on the free edge or from Fourner's dental vulnerability. While some regard Hutchinson's teeth as pathognomonic of a syphilitic infection, others deny that syphilis is the only etiologic factor, pointing out that rickets, deficient alimentation and endocrine disturbances may be important. The authors themselves encountered Hutchinson's teeth only in connection with hereditary syphilis. Two theories are most widely accepted about their pathogenesis in heredosyphilis: one assumes a direct specific action by *Spirochaeta pallida* while another assumes an indirect action of this organism by way of the endocrine glands. The authors report 6 cases in which they observed Hutchinson's teeth. In 3 the defect was in the permanent, in 3 in the deciduous teeth. All presented positive syphilitic reactions, but only 2 showed other clinical manifestations of heredosyphilis.

**Intestinal Obstruction in a Prematurely Born Infant**

—Ucha reports the history of an infant born prematurely during the eighth month of gestation. Since the infant did not expel meconium during the hours following birth, anorectal atresia was diagnosed. Rectal introduction of a Nelaton No 18 catheter indicated intestinal obstruction. Roentgenologic examinations were made without and with contrast medium. Tapid saline solution was administered rectally with pressure and induced the expulsion of a cylindric plug 10 cm in length, the examination of which disclosed meconium and small fragments of intestinal mucosa. The infant died on the fifth day, and necropsy corroborated the diagnosis.

**Boletín de la Soc Chilena de Obst y Ginec, Santiago****6 371-428 (Oct) 1941 Partial Index**

- \*Therapeutic Conduct in Convulsive Eclampsia L Matus—p 377

**Therapy of Eclampsia**—Matus injects into a vein 20, 30 or 40 cc of a 20 per cent magnesium sulfate solution or 60 cc of the solution intramuscularly, as well as hypertonic dextrose solution in large doses. The patient is isolated and put to rest. The injection is repeated within thirty minutes if the nervous excitement persists. Otherwise, intramuscular injections of 30 or 40 cc of magnesium sulfate solution is administered at intervals of four hours. As many as four or five injections are given. Intravenous injection of hypertonic dextrose solution is administered at the beginning of the treatment and is repeated in twelve hours. If the convulsions are not controlled by the first two or three injections, 20 cc of a 50 per cent sodium bromide solution and 40 cc of hypertonic dextrose solution is injected. The injections of magnesium sulfate are discontinued for the day. In grave cases 4 Gm of chloral is administered by rectum as supplemental therapy. With the onset of labor and dilatation of the cervix the membranes are ruptured. Otherwise pregnancy is not interrupted. The author warns against ouabain injections and preparations of the posterior part of the hypophysis in the course of labor in preeclamptic or eclamptic women. The former seem to have a harmful synergy with magnesium sulfate. Hypophysial preparations cause vascular spasm through which the convulsions are stimulated. Once the convulsions are under control the patient is given a daily intramuscular injection of 30 cc of a 20 per cent magnesium sulfate solution and a daily intramuscular injection of 40 or 60 cc of hypertonic dextrose solution. The treatment is discontinued when blood pressure, diuresis and urine are normal in puerperal women, and near normal in pregnant women. In the latter the treatment is reinstituted or intensified when labor approaches. At the beginning of the treatment the patients are put on the thirst and hunger diet for two or three days. The changes of diet from 0.5 liter or 1 liter of milk a day to a dry diet without salt to a diet with carbohydrates and later to a normal diet, depend on the course of the disease, the arterial blood pressure, diuresis and the urine. Vitamins in large doses are administered in the course of the dry diet and of the carbohydrate diet. The author treated 103 patients from 1937 to 1941. In 75 the convulsions were controlled by the aforementioned therapy alone. In 28 the convulsions diminished in frequency and intensity and the therapy was successfully supplemented or replaced by sodium bromide or chloral.

**Boletín de la Sociedad Cubana de Pediatría, Havana****14 49-112 (Feb) 1942 Partial Index****\*Hemorrhagic Purpura from Quinine Poisoning** R Pino Varas—p 49

**Hemorrhagic Purpura from Quinine Poisoning**—Pino Varas reports the case of a child 4 years of age who suffered from malaria and was given a total of 16.5 Gm of quinine in the course of treatment. There was no family history of hemorrhagic diathesis. The patient exhibited signs and symptoms of hemorrhagic purpura. The blood changes were of a toxic rather than a septic type. Purpura was controlled within one month by a therapy which consisted of liver extract, vitamin K and a diet abundant in milk and fruit juices.

**Lisboa Médica, Lisbon, Portugal****18 691-756 (Dec) 1941 Partial Index****\*Cardiovascular Changes in Typhoid** Electrocardiographic Study P Madeira Pinto—p 703

**Cardiovascular Changes in Typhoid**—Madeira Pinto made electrocardiographic studies in 20 cases of typhoid. Alterations of the auriculoventricular conduction of various types and of different intensity were observed in 6. They varied from simple increase of the conduction time to changes which indicated a complete block. Deformation and lowering of the S-T segment of the electrocardiogram with inversion or diphysism of the T wave and variations of the voltage of the T wave were observed in 12 cases. Extrasystolic arrhythmia was observed in 2. The electrocardiograms became normal in the first few days after disappearance of fever. However, the changes reappeared in 10 cases within twelve days when post-typhoid manifestations of cardiovascular character appeared. The electrocardiographic changes of convalescent patients lasted from two weeks to four months. The electrocardiographic alterations are, in the author's opinion, due to toxic irritation of the sympathetic nerves, to the metabolic disorders of the myocardium and to anatomic lesions of the myocardium. There is no relationship between the electrocardiographic alterations and the course of typhoid. Electrocardiograms are of no prognostic significance in typhoid.

**Revista Argentina de Reumatología, Buenos Aires****6 251-268 (Feb) 1942****Multiple Etiology of Acute Articular Rheumatism** G Costa Bertani—p 251**\*Mitral Stenosis in Children** Frequency and Diagnosis B Delgado Correa and Otilia Maccio—p 259

**Mitral Stenosis in Children**—The increasing frequency of cardiac localization of rheumatic disease in children induced Delgado Correa and Maccio to give particular attention to the early symptoms. Careful examination with the aid of electrocardiography, roentgenoscopy and at times with phonocardiography and phlebography, and the prolonged observation of the heart even in apparently pure articular forms led to the detection of a large number with mitral stenosis alone or associated with mitral or aortic insufficiency. Among 775 children with rheumatic disease 605, or 78 per cent, were found to have cardiac localization. Of these 317 had mitral insufficiency, 81 had mitral insufficiency and stenosis, 40 had pure mitral stenosis and others had aortic insufficiency and/or aortic stenosis alone or in combination with mitral, tricuspid and/or other cardiac lesions. The authors pay particular attention to the pure form of mitral stenosis, reviewing the 40 cases and an additional 34 cases in which there were no evident rheumatic antecedents. The 74 children varied in age between 4 and 15 years. Contrary to other investigators, who regard its occurrence as rare before the age of 14 or 15, the authors found that it is frequent even below the age of 10 years, 31 of 74 being of that age group. It was most frequent at the age of 11. Rheumatism is of greatest etiologic significance. The diagnosis of mitral stenosis is generally easy in children. Percussion often reveals an enlarged cardiac area. A thrill should be carefully searched for. Auscultation gives decisive information. The first sound may be accentuated, muffled or split. Occasionally auscultation discloses a slight systolic apical murmur. The mitral murmur is most plainly detected at the level of the second left inter-

costal space. Diastolic duplication and presystolic murmur are heard frequently in cases with rapid evolution. At the beginning of the diastole, mitral stenosis exhibits in place of the isolated sound, which is the second physiologic tone of the heart, two sounds, approximating the "ta-ta" of Durozier's murmur. Together with the first sound it produces a special murmur designated by Bouillaud "bruit de rappel." The detection of this murmur is of great importance for the diagnosis. Roentgenologic studies reveal prominence of the median arch, enlarged cardiac area and prominence of the left or of the right auricle. The electrocardiographic records disclose modifications of the P and T waves, alterations of the rhythm, preponderance of the right or left ventricles and the like.

**Revista Médica de Chile, Santiago****70 101-162 (Feb) 1942 Partial Index****Early Diagnosis and Treatment of Rheumatic Disease** E Cienfuegos—p 103**Some Aspects of Rheumatic Disease During Childhood** J Symon O and G Duffrau O—p 107**Early Diagnosis, Treatment and Prevention of Rheumatic Cardiopathies** Medicosocial Problem of Rheumatism in Children A Ariztia and O Illanes—p 117**Treatment of Medical and Surgical Disorders of Spleen** R Vargas Molinare—p 130**\*Timely Diagnosis of Gastric Cancer** H Alessandri R, F de Amesti, J Lerner M and M Ossandon—p 135

**Timely Diagnosis of Gastric Cancer**—Alessandri R and his associates stress the fact that early diagnosis of gastric cancer is not always a timely diagnosis. By timely diagnosis is meant that the cancer is still resectable and that there is no invasion of regional or distant lymph nodes. The degree of malignancy differs greatly in gastric cancers, in view of the extreme malignancy of some, early diagnosis is not necessarily a timely one. In cases of relatively slight malignancy the diagnosis may still be timely even though it is no longer an early diagnosis. Borrmann's classification is most suitable for practical purposes. Cancers of groups 3 and 4 of this classification are extremely malignant, their prognosis is unfavorable even if diagnosed early. Unfortunately, 80 per cent of all gastric carcinomas belong to this group. In the remaining 20 per cent, which belong to groups 1 and 2, the likelihood of timely diagnosis is considerable, because the neoplasms here are of a slow evolution and display little tendency to metastatization. The authors stress the importance of close cooperation between the radiologist and the gastroscopist in the timely diagnosis of gastric cancer.

**Archiv für klinische Chirurgie, Berlin****201 1-108 (Feb 26) 1941 Partial Index****\*Cause of Death in Venous Air Embolism, Experimental Study of Circulation and Respiration** H Bierhaus and H E Hintze—p 1**Problems in Vasography, with Special Reference to Arteriography** K Haszler—p 27**Complete Obstruction of Anastomosis Within First Few Days Following Gastric Resection** Anastomosis Phlegmon M Matyas—p 41**\*Effect of Intravenous Injection of Prostigmine, Sodium Chloride and Dextrose Solutions on Intestinal Motility** Experimental Study F Hamaguchi—p 50**Tumors of Region of Sella Turcica** H Kosie—p 89

**Cause of Death in Venous Air Embolism**—Bierhaus and Hintze produced venous air embolism in rabbits and studied the circulation and the respiration before, during and after the experiment. Air embolism produced a mechanical obstruction in the pulmonary circulation by blocking the arteries and capillaries of the lung with blood which contained air. Increased pressure in the pulmonary arteries elicits by reflex action a constriction of the right coronary vessels. Since, however, the right side of the heart requires more blood as the result of increased cardiac activity and this requirement is inadequately met, a heart death is easily explained. This death is not entirely due to reflex action, a number of other factors being involved. Unilateral or bilateral section of the vagus and administration of atropine do not alter the course of events in the pulmonary circulation following air embolism. The authors conclude that a vagus reflex cannot be the cause of death in air embolism. They believe that death is caused chiefly by mechanical factors involving the pulmonary circulation, although other components may constitute a factor.

**Influence of Prostigmine and of Solutions of Sodium Chloride and Dextrose on Intestinal Motility**—Hama-guchi describes animal experiments on the influence of prostigmine, of solutions of sodium chloride and of dextrose on the peristalsis of the small intestine. His studies were made on urethanized rabbits and revealed that hypertonic solution of sodium chloride produces a brief but noticeable increase in the tonus and the pendulum movements. Isotonic solution of sodium chloride exerts no influence on the motility. Hypertonic solution of dextrose reduces the tonus and causes disappearance of the motility. Isotonic solution of dextrose reduces the activity of the intestine but its effect is much less intense than that of the hypertonic solution. Not the simple existence of but the rapid increase in hyperchloremia or hyperglycemia is responsible for the effects of these two substances. Their effects are almost unchanged after exclusion of the vagi and the splanchnics. Prostigmine induces an intense and lasting stimulating effect on the tonus and the pendulum movements. Hypertonic solution of sodium chloride exerts a favorable effect on peritonitic intestinal paralysis by stimulating motility. In the presence of venous stasis hypertonic solution of sodium chloride temporarily suppresses the tonus of the intestine but the amplitude of the intestinal motility is increased.

**Open Pulmonary Tuberculosis in Children Under 10 Years**—Birkenfeld presents observations on 60 children with open tuberculosis. She defines as open cases in which the customary staining methods disclose tubercle bacilli in the sputum. Young children have no special types of open pulmonary tuberculosis but types closely associated with the primary infection are especially frequent. The hematogenous types of open pulmonary tuberculosis particularly lesions of the upper part of the lung with apical foci deserve particular attention. The mode of infection was familial in 32 cases extrafamilial in 6 and unknown in the others. In tuberculous lesions of the upper lobe with apical foci the infection was nearly always familial among 17 cases with open primary infiltrations there were 10 in which the source of infection was unknown. The clinical manifestation as well as the duration of the development varied greatly in children with open tuberculosis. Some relationship could be discovered between the quantity of the bacilli and the type of the lesion. The presence of a large number of bacilli usually indicates a cavity. In lymph node perforations atelectasis and foci with caseous softening, bacilli are often eliminated in small numbers and only for a short time. The open tuberculous lesion generally does not inhibit the physical development of the child. Psychic effects are likewise generally absent. While intercurrent disease plays an unimportant part in the development of open tuberculosis in young children tuberculous complications are comparatively frequent. Exudative pleurisy, cutaneous, abdominal, osseous, laryngeal and renal tuberculosis, spontaneous pneumothorax and empyema are some of the complications. The treatment presents no unusual problems. General treatment is of primary importance. The various forms of collapse therapy are employed when the general condition and the pulmonary lesions make an intervention seem promising. Caution is advised with regard to extensive methods of collapse. The prospects of cure are not favorable in the young child with open tuberculosis. A definite evaluation is possible only after ten years of observation and after puberty has been completed without exacerbation of the tuberculous process. The prognosis is not entirely unfavorable.

**Pathogenesis and Therapy of Alimentary Intoxication of Infants**—Biogenic amines particularly histamine and choline may play an important part in the pathogenesis of alimentary intoxication in infants. There is a similarity in the

manifestations of alimentary intoxication and experimental histamine shock. Dieckhoff studied the histamine and choline contents of the blood of infants with dyspepsia and alimentary intoxication. He found that the blood of infants without intestinal disorders contains from 20 to 40 micrograms of histamine per liter. During dyspepsia this amount is not greatly increased, but in the course of alimentary intoxications it amounts to from three to four times the normal quantity. The choline content of the blood of healthy infants fluctuates between 0.22 and 0.36 mg per hundred cubic centimeters. In dyspepsia there is no essential increase, but during alimentary intoxication it reaches from four to five times the normal quantity. A substance which contains histamine and other ferment-like substances and which had been used successfully in the treatment of alimentary intoxication was tested for its destructive action on histamine by *in vitro* tests and it was found that it inactivates the increased histamine content of the blood of intoxicated infants. The circulating volume of blood is reduced during alimentary intoxication, this reduction is caused chiefly by the loss of plasma which in turn is brought on by the increased permeability of the vascular wall. It is important to increase the circulating quantity of blood. This can be done by mobilizing the blood in the depots by means of beta-(*p*-oxyphenyl) isopropyl-methylamine which is isomeric with ephedrine and known also under the term veritol.

**Treatment of Allergic Diseases**—In order to avoid an inadequate diet in a boy who proved to be allergic to many essential foods, Stolte decided to neutralize the allergens, which presumably were proteins, by precipitating them with tannin. It was assumed that they could be absorbed after they had been decomposed so that they could no longer act as allergens. Earlier tests had proved that the boy was extremely allergic to eggs, milk, cheese, beans and peas. It was decided to make a cautious attempt with eggs. On the first day the boy was given a teaspoon of an egg that had been beaten into red wine. No reaction followed. On the following day he was given half of an egg and on the third day a whole egg, each time in wine, again there were no reactions. For the precipitation of the allergens in other foods, a powdered tannin preparation was sprinkled on like salt. The child was now able to eat beans, peas and other foods against which he had been allergic. When the tannin was omitted the reactions recurred, but they subsided again when the red wine and tannin therapy was resumed. The treatment was tried in many other cases with frequently equally favorable results. A report by Hansen states that while some white wines may give rise to urticaria, red wine never does probably because the tannic acid in it precipitates highly molecular substances.

Proteus Infection in Acute Intestinal and Nutritional Disturbances in Infants Ruth Marie Konsek—p. 69  
\*Plasma Therapy J. W. Camerer—p. 101

**Idiopathic Progressive Brown Pulmonary Infiltration with Hemoptysis, Anemia, Eosinophilia and Nephritis**—Glanzmann and Walthard describe a new clinically well defined disease entity. The patient, a girl aged 11½ years had periodic attacks of hemoptysis. At the age of 6 years the child had had scarlet fever. On the basis of a scarlet fever nephritis a probably embolic focal nephritis developed which led to chronic hematuria. The recurrent loss of blood produced anemia with leukopenia and periodic blood eosinophilia. Although some thrombopenia could be ascertained there were no indications of a general hemorrhagic diathesis. Roentgenograms of the lungs revealed spotted shadows particularly in the two lower lobes. The case represents a peculiar hereditary familial pulmonary defect in which probably as the result of inherited

weakness and defective formation of elastic fibers, circulatory disturbances develop in the pulmonary capillaries. The capillaries are given insufficient support by the elastic fibers, they swell into the alveolar lumen, and during the phase of expiration they are inadequately pressed out by the elastic fibers, so that, in the absence of cardiac defects, stasis and hemorrhages take place into the pulmonary alveoli. The alveoli become filled with cells. A progressive brown pulmonary induration develops with extraordinary hemosiderosis of the lungs and complete iron incrustation of the collagenic and particularly of the elastic fibers. Changes in the framework may cause circulatory disturbances, because the veins which course in it are kept gaping, as is the capillary system. The prognosis of the disorder is unfavorable. Death ensues after two or three years.

**Pectin in Early Stage of Poliomyelitis**—Brunthaler calls attention to the fact that a considerable number of patients with poliomyelitis have diarrhea in the early stage. Having used the apple diet in the treatment of enteric diarrheas, he resorted to this treatment in cases of diarrhea in which poliomyelitis was suspected. The impression was gained that not only the intestinal disturbance but also the suspected basic disease was favorably influenced. In 13 children of ages between 5 weeks and 5 years with symptoms suggestive of poliomyelitis he administered at once 20 cc of a 3 per cent of pure pectin solution into the gluteal region. The cerebrospinal fluid could not be examined in all cases, because permission was not granted. In some of the cases in which the fluid was examined negative results were obtained, in 4 cases results were positive. Observations on a large clinical material will be necessary to decide the effect of pectin in poliomyelitis.

**Plasma Therapy in Infants**—Camerer employed plasma transfusions to combat dehydration, particularly in cases of manifest intoxication. Improvement in the treatment was imperative not only because the number of intoxications in infants had more than doubled in two years but also because the mortality was extremely high (66 per cent). He administered 50 cc of plasma per kilogram of body weight, as suggested by Bessau, but later reduced the amount to 25 and even to 20 cc per kilogram of body weight. Administration of plasma produced rapid improvement in the general state of the patient, disappearance of toxic symptoms, improvement of the turgor, increase in weight and improvement in appetite. The mortality rate of intoxications without plasma therapy in 58 cases and with plasma therapy in 46 is compared. The total mortality was reduced to nearly one half under the influence of plasma therapy, and when the fatalities of the first twenty-four hour period are deducted the rate is only about a third of what it had been before plasma therapy was instituted. Plasma therapy was used also in 61 cases with severe, frequently pre-toxic dyspepsia and in 6 without dyspepsia in which vomiting had caused severe dehydration. Plasma therapy presents a distinct advance in the treatment of acute dehydration.

**Action of Desoxycorticosterone on Salt and Water Economy**—Adrenalectomized animals and patients with Addison's disease exhibit disturbances in the water and salt metabolism, as well as disorders in the carbohydrate, fat and protein

metabolism. Some investigators place the stress on the salt and water economy, others emphasize the carbohydrate metabolism and still others assume that the cortical hormone has a much more general and fundamental function in the cellular metabolism. Heni reports a case of Addison's disease in which 10 mg of desoxycorticosterone acetate was administered together with 10 Gm of sodium chloride and 5 Gm of sodium citrate. There has been a gain of 9 Kg in fourteen days. Records of water intake and elimination disclosed that this increase in weight was entirely due to water retention, which was manifested as edema. After the desoxycorticosterone was discontinued, the retained water and sodium chloride were eliminated and the weight decreased to normal values. A repetition of the desoxycorticosterone medication again resulted in water retention. Similar observations were made by American investigators. Heni administered desoxycorticosterone to 13 persons without adrenal defects. All of them exhibited a noticeable decrease in the elimination of urine and of sodium chloride. Reduction of the hematocrit value, the hemoglobin, the erythrocytes and the total protein content indicated a considerable dilution of the blood. The water retention which caused a gradual increase in weight could be intensified by the simultaneous administration of sodium chloride. The question as to where in the salt water economy the desoxycorticosterone has its point of attack could not be solved in the described experiments. The chief indication for the use of desoxycorticosterone is true adrenal insufficiency. To avoid harmful effects it is best to begin with small doses. In view of the effect on the sodium chloride and water economy, desoxycorticosterone can be given also in hypochloremic uremia, in severe postdiarrheal dehydration and in serious nutritional disturbances and alimentary intoxications. The favorable effect in severe burns is probably a result of modification of the water economy. In toxic circulatory weakness of diphtheria and other infectious diseases desoxycorticosterone should be given in large doses together with considerable amounts of sodium chloride.

**Influence of Chloroform on Serum Colloids as Basis of a Serum Reaction**—Knüchel points out that in extraction of blood serum or plasma with fat soluble substances such as chloroform, ether and petroleum ether a turbidity appears. Serum of healthy subjects or of those without infectious disease always showed a high degree of turbidity, whereas serum from patients with acute or chronic infections had a comparatively low degree of turbidity. The author investigated the physical or the physicochemical conditions that cause this turbidity or are responsible for its absence. The studies included the measurement of the dynamic surface tension and ultramicroscopic observation of the turbid fluids. It was found that the body which causes the turbidity is a protein cholesterol compound of the globulin fraction. Clinical observations and animal experiments suggest that the degree of turbidity reflects to a certain degree the state of immunity. The turbidity test promises to furnish information on the existence and the course of infectious diseases or with regard to the state of immunity. It could replace the more complicated determinations of the cholesterol content.

**Action of Short Waves on Flow of Bile**—Leskovar shows that with the application of short waves to the gallbladder two effects can be expected: (1) action on the hepatic parenchyma, (2) action on the smooth musculature of the extrahepatic biliary system. The author is concerned chiefly with the effect on the hepatic parenchyma. Experiments on 6 rabbits and 5 dogs demonstrated that a mild choleeresis is induced when short waves (6 meters) are applied for from fifteen to thirty minutes to the upper part of the abdomen. The choleeresis action of the short waves is not as great as that of a mineral water with a considerable magnesium content. Short wave treatment does not influence the biliary secretion elicited by the food stimulus. Determination of the dry residue of the bile indicated that short wave treatment does not produce contractions of the gallbladder that lead to the expulsion of bladder bile. Examination of the liver bile in 2 dogs disclosed that short wave treatment increased its water content in 1 case and decreased it in the other.

## Book Notices

**Unconsciousness** By James Crier Miller Cloth Price \$3 Pp 329  
New York John Wiley & Sons Inc London Chapman & Hall  
Limited 1942

This book represents a serious attempt to clarify the meaning of the term unconscious. The author states in the preface "The enigma of unconsciousness has been approached from many angles from the neurological at the one extreme to the philosophical at the other. It has been the subject of careful experimentation on the one hand and of soaring theorizing on the other. The problem has embraced such different phenomena as fainting, hypnosis, inattention, creativity, repression and instinctual behavior. Some who have interested themselves in these questions have seen that all these sorts of unconsciousness cannot be identical, and they have often insisted that they do not even have similar characteristics. Therefore various terms have been invented, compounds of the word conscious, in order to distinguish and explain these different phenomena. Such words are subconscious, preconscious, foreconscious, superconscious, coconscious and so forth. The results of this neologizing however has not been increased clarity but greater confusion. Moreover, many dissimilar sorts of behavior are still called unconscious, without any efforts being made to define the various senses of this wide term. The author attempts to distinguish the various meanings of the word unconscious and to differentiate and demonstrate variations in human behavior which have been classified as unconscious. To do this the author presents sixteen different meanings or definitions that may be classified as pertaining to unconsciousness: 1 Inanimate or subhuman incapable of discriminating or behaving. 2 Absent minded day dreaming anesthetized—unresponsive to stimulation. 3 Not mental. 4 Undiscriminating (applied to the individual or to his actions). 5 Conditioned acting sheerly on the basis of conditioning (applied to an individual), conditioned merely conditioned responses (applied to his actions emotions). 6 Unsensing (applied to an individual) unsensed (applied to his actions, emotions, needs, drives). 7 Unnoticing or unattending (applied to an individual) unnoticed or unattended (applied to his actions ideas emotions needs drives). 8 Insightless, lacking insight in the sense used by the gestalt school of psychologists (applied to an individual) not involving insight (applied to his actions, ideas). 9 Unremembering (applied to an individual), unremembered (applied to his actions emotions, needs drives). 10 Acting instinctively, behaving on an unlearned basis (applied to an individual) unlearned or inherited (applied to his actions, ideas emotions, needs, drives). 11 Unrecognizing (applied to an individual), unrecognized (applied to his emotions needs, drives). 12 Acting involuntarily (applied to an individual), involuntary (applied to his actions ideas, emotions). 13 Unable to communicate (applied to an individual), incommunicable (applied to his actions, ideas, emotions needs drives). 14 Ignoring (applied to an individual) ignored (applied to his actions ideas needs emotions). 15 Unconscious has come to have a specific psychoanalytic meaning. Originally unconscious processes were to Freud those unavailable to consciousness, which he likened to an "organ of perception." Concerning unconscious processes in this basic sense Freud made several propositions, and these are all represented by the particular freudian meaning of unconscious which in German he abbreviated UBW and which in English is abbreviated UCS. These propositions concerning unconscious processes are (a) that they are dynamically repressed away from consciousness the "organ of perception," (b) that they can be made available to consciousness only by special techniques such as hypnosis and psychoanalysis and (c) that they are not under voluntary control. 16 Unaware of discrimination (applied to an individual) unavailable to awareness (applied to his actions, ideas emotions, needs drives).

Although the author approaches the subject from the standpoint of the experimental and laboratory psychologist he has demonstrated his definitions with clinical material. The book is well written and the bibliography is exhaustive but it would seem that the author writes about psychoanalytic concepts particularly the unconscious, without much real understanding of

the subject. He quotes Freud's basic writings freely but makes little or no reference to the many excellent observations made by other students of psychoanalysis since Freud's original contributions. However, this does not seriously detract from the value of the book with reference to its main theme.

**Functional Neuroanatomy** By Wendell J S Krieg Ph.D Assistant Professor of Anatomy College of Medicine New York University New York Cloth Price \$6.50 Pp 553 with 274 illustrations plus section atlas by the author Philadelphia Blakiston Company 1942

Not many books are throughout so expressive of a personality that one feels certain that the author wrote because he enjoyed doing it—because like a true artist something within him cried out for expression. This is such a book. Not only is it well written and extremely well illustrated but it brings to the teaching of neuroanatomy a new and an interesting approach. The teaching of neuroanatomy needs a new approach. Probably no other subject is generally more poorly taught and more thoroughly disliked by the students than this. Hardly more than one out of fifty of them acquires sufficient from his course in neuroanatomy to make it worth his while. Here is a method, a book and in large measure the material whereby neuroanatomy can become one of the most intriguing of medical subjects. Every teacher who will take the time to become thoroughly familiar with Krieg's book and his method can, if he has a drop of the real teacher's blood in his veins, revise his course for the better.

With the exception of Rasmussen's valuable but much briefer and more diagrammatic book on pathways in the central nervous system the present book is unique in neuroanatomy. Krieg has presented the nervous system not as uninteresting cold, functionless slides of neural tissue but as an active dynamic mechanism. He is concerned here with how it is constructed, how the various parts are integrated, with how they operate and with what they do. In his presentation he has grouped those structures which form one system together and has discussed them as parts of a mechanism. Thus one finds the auditory system (the ear, cochlear nerve, cochlear nuclei, trapezoid body, lateral lemniscus and medial geniculate body) presented together. The same is true of the visual system, the somesthetic system, the pyramidal and the extrapyramidal motor systems, and others.

Not the least important part of this textbook are the illustrations all but twenty-nine of which have been drawn by the author himself for this book. Many of them are three dimensional so that the course of the neural pathway or the location of the nucleus under consideration is clearly demonstrated. All are well conceived and with but few exceptions (notably figures 30, 150 and 151) are unusually well drawn.

Like all other books, this one has its faults. However, they are neither numerous nor important. The majority of them seem to arise because the author is presumably neither a physiologist nor a clinical neurologist. Thus, on page 36 muscular contracture usually arises from overaction of unopposed intact muscles rather than from shrinkage of connective tissue in the paralyzed muscle. Nor is it necessary to keep paralyzed muscles "alive by direct electrical stimulation" in order to insure their recovery. On page 40, all modern neurophysiologists would disagree with the statement that the afferent end organ concerned in the knee jerk is located in the tendon. On page 71 the statements that destruction of the spinal accessory nerve results in an inability to turn the head to the opposite side and to shrug the shoulder are incorrect. Few clinicians would agree with the statement on page 178 that homonymous hemianopsia commonly arises as a result of the accumulation of fluid in the temporal horn of the lateral ventricle, which stretches the fibers of the visual radiation. Few would agree with the generalization made on page 185 to the effect that loss of the pupillary reflex on accommodation while the pupillary reaction to light is retained, is due to severing the neuron running from the calcarine cortex to the accommodation center. The old 'onion skin' distribution of sensation of the face presumed to result from the distribution of the sensory fibers in the brain stem, shown in figure 134 b is not in accord with recent clinical observations. The statements on page 213 that the motor division is of necessity sacrificed in the operation of retrogasserian neurectomy and that even when this division is sacrificed this

"seriously handicaps mastication" are inaccurate. The statement on page 264 that sections above the midbrain do not give rise to any abnormality of tonus results from attempting to carry over physiologic experiments on lower forms to the sub-human primates and man and is not true for the latter, as the author clearly shows in his discussion of the extrapyramidal cortical system. Furthermore, the discussion of the spasticity resulting from cortical lesions (p 337) is not accurate. The author attempts (pp 336 to 340) to divide Brodmann's area 6 into a premotor and an extrapyramidal area. This is not in accord with the ideas of other workers in this field and only serves to confuse the student. The statement (p 399) that with right sided cerebellar lesions "the right arm is held stiffly away from the body" is incorrect. There are certain annoying colloquialisms throughout the book, such as "nigra" for substantia nigra, "oblongata" for medulla oblongata, "gray" for gray matter and "dura" for dura mater. At times grammatical construction is poor. This is particularly true in the use of words of reference. For example, on page 171, fourth paragraph, what does "them" in the sixth line refer to, and does "they" in the tenth line refer to the optic tracts or to the cerebral peduncles? On page 178, second paragraph, first line, to what does "such cases" refer? On page 336, line 13, does "it" refer to area 6a, which is the subject of the preceding sentence, or to the strip region, which is the subject of the paragraph? There are but few typographic errors. Among the most obvious are the following: on page 63, line 16, figure 30 probably should read figure 33. The same is true on page 65, line 25. In the legend to figure 218, page 356, "Intercranial" should be Intracranial, and in the legend to figure 224, page 362, "fourth ventricle" should read "temporal horn of the lateral ventricle."

Again it should be emphasized that these faults are few and do not detract materially from the value of this book. The book is designed for and will prove most useful to those who wish to learn the structure of the nervous system. For that purpose it is probably the best book that has ever been written. It will not prove as useful, however, as a reference book.

The atlas at the end of the book which correlates the appearance of sections stained by the Weigert method, which are the chief laboratory material of students of neuroanatomy, and a three dimensional diagram of the important nuclei and tracts will prove most useful and has been beautifully drawn.

There is a useful index but no bibliography, although a few source books with useful bibliographies have been cited.

*The Eclipse of a Mind* By Alonzo Graves. Cloth. Price \$5. Pp 722. New York: Medical Journal Press, 1942.

This is the story of a gifted but psychopathic newspaper reporter who suffered two mild illnesses in his late teens which are not adequately described but which were colored by depression. At 30 he had a borderline episode the precise nature of which was not recognized and which did not require hospitalization. Subsequently he had five hospitalizations, at 37, 40, 41, 42 and 45. These illnesses presented certain unusual clinical features. They were florid paranoid schizophrenic states marked by a wide variety of delusions and hallucinations but occurring always in a setting of manic excitement with some elation. Each time, as the hyperergastic state subsided, the delusional and hallucinatory material gradually dropped out of the picture and the patient was able to return to a more or less normal life. Large portions of the hospital record of each admission are included in the text and it is dismaying to find that in spite of long discussions of the abundant paranoid schizophrenic material the case was persistently diagnosed "manic-depressive psychosis" merely because the powerful emotional tides caused such extreme fluctuations in the intensity of the underlying delusional process. This is not calculated to increase confidence in state hospital statistics. In no place was the pertinent question raised why it is that some patients manifest their paranoia in a setting of depression and others in a setting of overactivity and elation.

On the occasion of the patient's fourth hospitalization Dr. Parkman, the compiler of the volume, set the patient to work typing out his own history, his reminiscences of his early life, his comments on his various strange experiences, on his delu-

sions, on his hallucinatory experiences, and on the hospital notes themselves. The work was begun in 1933 while the patient was still quite ill and continued over several months as he improved. Consequently comments on his original comments frequently had to be added in footnotes as he gathered additional insight. At places the hospital notes and the patient's more or less relevant comments are printed in parallel columns.

This strange autobiography is interspersed with many essays on a wide array of topics: police reporting, prostitution, white slavery, hypnotism, political and economic problems, the boom years and the depression, and thumbnail sketches of many of his companions in the hospital. In chapter 65 there is a moving, challenging and skilful description of life in a state hospital, which he calls "a worm's eye view of a mental hospital." There are further chapters on his sex life, his dream life and the meaning of his emotional fluctuations to himself. The method by which the material was gathered is described on pages 540-544. The naïveté of the editor in accepting as conclusive the patient's own explanations of many things is exemplified in many places, as for instance on page 541, where he accepts the patient's rationalizations of his impotence as an adequate explanation.

Gradually the patient evolved a masochistic reaction to his whole experience. He left for Russia in September 1934, and no data seem to be available on his condition since 1935.

At best one might say that the book contains the raw material on which a scientific study might be made. Unfortunately, to the reviewer it seems doubtful whether an analytic dissection and synthesis of the text would repay the effort without having the patient there to investigate directly and to fill in the many essential gaps which exist despite the mass of material offered. It is characteristic of the book's defects that the first adequate clinical history of the illness is found on pages 502-504, when it becomes evident that the patient suffered from masked semi-psychotic states even in childhood. The relation of this fact to the development of a psychopathic personality is nowhere considered.

So much labor has gone into compiling the volume that one regrets not being able to find in it more that is of value.

*Mental Hygiene for Community Nursing* By Eric Kent Clarke, M.D. F.A.P.A. Professor of Psychiatry and Pediatrics, University of Minnesota Medical School, Minneapolis. Cloth. Price, \$3.50. Pp 267. Minneapolis: University of Minnesota Press, 1942.

This is an excellent book designed to aid nurses in public health and school services, or in industry, in an understanding of problems of mental health and disease. The community nurse is in a particularly favorable position to have early contact with disturbed or potentially disturbed children and adults. If she is sufficiently informed to see that these cases are referred early for proper diagnosis and treatment, much subsequent mental illness or social disability may be prevented. The problems of physical health which the nurse must deal with are often complicated or caused by emotional difficulties, early recognition of which may greatly facilitate treatment.

The author systematically discusses the mental health problems of childhood, adolescence and adult life. His approach is that of the psychiatrist experienced in modern child guidance methods and points of view. The material is well organized and many case discussions are included. In many instances the case discussions are purposefully oversimplified in that many obvious dynamic causative or contributing factors in a given case may be overlooked or omitted. This permits a pointing up of factors the author is particularly interested to bring to the attention of nurses.

Dr. Clarke points out the particular obligation of the community nurse to understand and utilize the community resources for study and treatment of emotionally or socially disturbed children and adults. He places wise limitations on her responsibility, which is not that of the psychiatrist or of the social worker. He points out particular fields of useful activity, especially in dealing with mothers and their children in which the psychiatrically oriented nurse can offer wise guidance and counsel. He concludes with a chapter on the mental hygiene of the community nurse herself.

This is an excellent book which can be profitably read by nurses as a useful review of mental health problems.

## Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT, HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS, BUT THESE WILL BE OMITTED ON REQUEST.

### PROTECTIVE CLOTHING AND OINTMENTS FOR WORKERS EXPOSED TO CHROMATES IN TANNERIES

*To the Editor*—A number of men working in a leather tanning factory have been getting a dermatitis of their forearms and occasionally their arms and lower abdomen. There is a moderate amount of pruritus with this eruption. The tanning solution that they come in contact with is made from potassium bichromate, glucose and sulfuric acid. The resulting solution is known as a chrome tanning solution. The hides are hung in vats filled with water and a certain percentage of chrome tanning solution is added. After these hides are taken out, other hides are added and more of the chrome tanning solution is added, also some sodium bicarbonate to reduce the acid content. The men affected are those who carry the poils of the chrome tanning solution and those hanging and removing the hides from the vats. Usually there is no dermatitis until they have been working at this from three to six months. Removing to other work and the use of a soothing ointment completely cures this condition. My diagnosis is a sensitivity dermatitis, but my problem is one of protection against the dermatitis. I would appreciate any information you can give me as to the protection of these men against the dermatitis.

Philip L. Wolgin, M.D., Elizabeth N. J.

*ANSWER*—Dermatitis is of frequent occurrence among workers in tanneries. Chromate tanning solutions are among the principal causes. Concentrated solutions of the alkaline bichromates will cause chronic ulcers called 'chrome holes,' especially if they enter into abrasions of the skin. Such ulcers are fairly common among workers in tanneries. Exposure to chromic acid and the chromates may in time also cause allergic eczematoid dermatitis. These patients seem to have the allergic type of chrome dermatitis, as shown by the fact that they became sensitized after three to six months' exposure. The treatment outlined is the correct one, as their complete recovery proves.

Effective preventive measures used in most modern tanneries against this type of dermatitis consist in the wearing of impervious sleeves, aprons and gloves. These could formerly be obtained from rubber manufacturing concerns, but since rubber is now difficult to obtain on account of the war priorities, the sleeves and aprons may be made from oilcloth or any of the water impervious synthetic resins such as phlofil, koroseal, vinylite, cellulose acetate or waterproof cellophane. Sleeves should be worn over the rubber gloves and fastened at the wrist. No information has been found on manufacturers of such protective clothing and the workers usually must make them for themselves.

Protective ointments offer less protection than garments such as described, but if protective ointments are used they should be of the water insoluble type, such as mixtures of hydrous wool fat 70 per cent and castor oil 30 per cent. To this may be added 2 per cent of a wetting agent such as duponol to facilitate its removal after work.

There are several types of protective ointments on the market which are similar in composition to the foregoing formula. Some of these are:

West No. 33 West Disinfecting Company, 4216 West Street, Long Island City, N. Y.

Phy 6 Milburn Company, 908 Henry Street, Detroit.

Sav Skin, Doak Company, 2132 East Ninth Street, Cleveland.

Chrome Ointment, Wambaugh Chemical Company, Goshen, Ind.

Tecto, Duke Laboratories, Inc., Stamford, Conn.

Practi-Kreme, Prack Laboratories, Inc., 42 West Fifteenth Street, New York.

Daily change to clean work clothes and cleansing showers immediately after work are of great value in preventing dermatitis among tannery workers.

### CHRONIC CUTANEOUS LESION OF FINGERS

*To the Editor*—May I have your advice concerning the treatment of a long standing eczema of the fingers which has not responded to roentgen or other local treatment by a dermatologist? The patient, a man of 32, says the condition started at the age of 12 when he was accustomed to bite his nails. There is a family history of allergy but no incriminating agent has been uncovered. The lesion is worse in winter when the patient has been accustomed to wear wool gloves, but cutaneous tests to wool antigen have been negative. So have other cutaneous tests to common foods and common environmental allergens. However, a cutaneous test with trichophytin did give a strong local reaction. Oidiomycin was negative. There is no evidence of epidermophytosis of the toes at present, although the patient has had this condition in the past. I am told that desensitization with trichophytin may produce a constitutional reaction unless great care is used and that the treatment would probably be ineffective, particularly in a case of such long standing.

Clifford Kuh, M.D., New Haven, Conn.

*ANSWER*—From the meager description given, any attempt at a diagnosis is not justified, but from the expression "eczema of the fingers" it seems likely that a superficial dermatitis involving all or most of the fingers is present. Four of the diseases commonly involving the fingers and coming under this head are (1) contact dermatitis, (2) fungous infection, (3) neurodermatitis and (4) pompholyx.

The first is the result of sensitization to any one or several of the substances with which the hands come in contact in work or at other times. After a long persistence of the disease the sensitization is always multiple. Study of the patient's habits at work and during his leisure, especially study of acute exacerbations if such occur, may lead to discovery of the offending substances. The cutaneous tests cited in the query with wool antigen, foods and other allergens were apparently scratch or intradermal tests which do not apply to contact dermatitis. Patch tests made on normal skin of the forearms may be of value in detecting the causal substances. Soap is one of the commonest offenders, and such dermatitis is always worse in winter when the dry air adds to the drying effect of soap. Wool gloves, even though there is no sensitization to wool, would irritate the inflamed skin. Cotton gloves should be worn under them. Avoidance of all irritants, the use of oil or one of the sulfonated oil detergents for cleansing and soothing local applications, such as calamine powder 4 parts, zinc oxide 4 parts, starch 7 parts and sufficient rose water ointment to make 30 parts, applied thinly night and morning after cleansing gently with oil. A light bandage or thin cotton gloves may be worn over it. Soft ointments do not succeed as well with contact dermatitis as do drying applications. One per cent phenol or a somewhat larger proportion of menthol may be added.

In the diagnosis of the second possibility, infection with a fungus, the trichophytin local reaction cited is no proof that the patient is now suffering from a fungous infection. It shows only that at some time in the past he has had such an infection. Fungous disease of the fingers may sometimes be diagnosed directly from the cutaneous lesions but usually requires proof of cultures or discovery of the fungus by direct microscopic examination of the scales or roofs of vesicles. Local treatment is usually successful in clearing a fungous infection but difficulties are encountered, especially in cases of long duration. If the dermatitis is a dry one, painting daily with 20 to 50 per cent of tincture of iodine in alcohol, or the application once a day of weak Whitfield ointment 2 to 4 per cent salicylic acid with twice as much benzoic acid in rose water ointment, will often succeed. If the infection is resistant, 0.5 per cent thymol may be added to the ointment or an ointment or chloroform paint of chrysarobin 2 to 5 per cent, may be necessary. The patient must be warned of the great danger of carrying the latter to his eyes. The hands should be kept covered. The advice with regard to desensitization with trichophytin is correct. Attempts to accomplish this are attended with considerable risk of unpleasant reactions and even the possibility of increased sensitivity.

The mention of a family history of allergy and the fact that the patient in childhood was a nail biter with the information that the disease is always worse in winter, suggest that the dermatitis of twenty years' duration may be on a nervous basis. The negative scratch or intradermal tests (if the conjecture regarding these is correct) do not favor this diagnosis but do not disprove it. The patient's neurocirculatory and mental reactions should be studied and he should be quizzed on the habit of rubbing or picking his fingers. Involvement of the flexures at the elbow and knees, the eyelids, the nape or the external surfaces of the extremities should be looked for. If this is determined to be the correct diagnosis, rubbing, scratching or picking should be strictly interdicted and the zinc paste with phenol or menthol should be given him with instructions to use it in place of scratching when the paroxysms of itching come on. Cool wet dressings of saturated boric acid solution are of value in allaying the itching, the lotion being dabbed dry after

an application of from fifteen minutes to an hour and the zinc paste applied. In this case, as in the case of contact dermatitis, soap and water should be avoided and wool should not be worn next the skin. The cause of the trouble should be explained to the patient and his cooperation required, by the avoidance of scratch mechanical irritation. Rest should be insisted on, best by change or a vacation of some length. The discussion of this subject by Becker and Obermayer (Modern Dermatology and Syphilology, Philadelphia, Montreal and London, J B Lippincott Company, 1940) is an excellent one.

The fourth possibility considered is frequently recurring attacks of pompholyx, a disease on a constitutional basis which resembles ringworm infection clinically but is related to neurodermatitis in its etiology. Vesicles on the sides of the fingers are typical of this condition, deeper than the vesicles of contact dermatitis, in fact, on the palms and soles they are quite deep. They occur in groups, and itching is quite severe. For a vesicular eruption, use cool wet dressings or baths of aluminum subacetate solution, 1 part to 16 of water, kept on for an hour at a time, then apply the cuticolar lotion of Fantus and Dymewicz (Cuticolar Preparations, *J Am Pharm A* 27 878 [Oct] 1938), an addition of a skin color powder to bentonite suspension. This is dabbed on and allowed to dry. The more severe the attack the longer should the wet applications be used and the shorter the interval of cuticolar lotion. A solution of potassium permanganate in water may be used as wet dressings or baths in place of the aluminum solution.

When the vesicles have dried up, the zinc paste may be applied thinly. To prevent recurrences the same general treatment as that used for neurodermatitis is indicated.

#### HEBERDEN'S NODES

To the Editor—I should like to obtain the latest information on the prognosis and treatment of Heberden's nodes

M D, Virginia

ANSWER—These "little hard knobs frequently seen on the fingers" were first described by Heberden in 1802, but his description of them was so meager (only fifty-three Latin words, translated into seventy-nine English words) that many diverse clinical, pathologic and roentgenographic definitions of the condition have since arisen. Certain physicians of the last century regarded Heberden's nodes as manifestations of gout, but current opinion is that they have nothing to do with gout but are an expression of primary (idiopathic) osteoarthritis. When primary osteoarthritis affects fingers it most commonly affects terminal phalangeal joints, sometimes midphalangeal joints (later affected) and the "thumb base" also, but metacarpophalangeal joints are rarely if ever affected. Although osteoarthritic midphalangeal joints may become somewhat nodular, and although Heberden himself did not specifically confine his digitorum nodi to the terminal phalangeal joints, it is the terminal phalangeal joints which exhibit the most nodular osteoarthritic processes, hence current definitions generally restrict the term "Heberden's nodes" to the involvement of the distal phalangeal joints of fingers. No analogous changes affect the toes.

Osteoarthritis of terminal phalangeal joints may arise (1) from acute trauma (traumatic Heberden nodes) as a result, for example, of baseball injury (baseball finger) or of catching a finger in a door or window, or (2) spontaneously, without a history of any specific injury (true Heberden nodes, the idiopathic type which Heberden described). The first or traumatic type is characterized by degenerative cartilaginous and hypertrophic bony changes indistinguishable from those which occur in the idiopathic type. But the clinical history of the traumatic type is readily distinguishable from that of true, or idiopathic, Heberden nodes: there is a definite history of acute injury followed at once by pain and swelling of periarticular soft tissues, in the course of several weeks or months hypertrophic osseous changes affect the injured joint, in a relatively short time the articular enlargement becomes painless and remains unchanged through life.

In contrast, the true, or idiopathic, Heberden nodes make their appearance insidiously, occasionally in young or middle aged persons but generally in persons aged 45 or more. The first symptoms may be numbness and tingling of the affected finger, with mild transient aching and tenderness on pressure, in this early stage the finger may be objectively and roentgenographically normal. As the disease progresses, tenderness and aching become more chronic and periarticular thickening and inflammation appear, roentgenograms may now show beginning thinning of the interosseous space, indicative of cartilaginous destruction. Slight marginalipping introduces the osseous reaction. The bony node slowly increases in size, although the periarticular reaction may begin to subside. Roentgenograms may then reveal

cartilaginous destruction and irregular destruction and hypertrophy of marginal and subchondral bone. This destruction often leads to lateral or mesial displacement of terminal phalanx. Finally, nodes lose their tenderness, the swollen and thickened periarticular soft tissues contract over the persistent bony knobs, and thereafter the Heberden node remains as a relatively painless but rather unsightly nuisance. The pathologic histologic structure of these nodes has been described in detail by Brogster (*Verhandl d deutsch Gesellsch f inn Med* 40 640, 1928).

An occasional complication is the appearance of synovial cysts, cystic nodules on the dorsal aspects of the fingers at, near or between the terminal and midphalangeal joints. These small gelatinous cysts, attached to tendon sheaths, occasionally become inflamed and sometimes are opened and evacuated surgically. Thereafter the walls collapse and the nodule recedes, but it may reform. Usually the cysts need not be opened, because often they will slowly recede spontaneously. Similar lesions may affect persons without Heberden's nodes, their pathologic reactions have been described (Weber, E P, and Freudenthal, W, *Proc Roy Soc Med* 31 345 [Feb] 1938).

The cause of true, or idiopathic, Heberden nodes is not known but is doubtless the same as that of primary osteoarthritis, of which it is an expression. Age certainly is an important predisposing or conditioning factor, for the incidence of Heberden's nodes is notably related to age. Stecher in his recent study (*New England J Med* 222 300 [Feb 22] 1940) reported their increasing incidence in white persons and Negroes of advancing years. Their incidence among persons less than 50 is small, but after this age it increases rapidly, so that the nodes appear in about 6 to 20 per cent of elderly white men and 15 to 30 per cent of elderly white women. They are about twice as common among white women as among white men and about as common among Negro men as among white men, they are more common among Negro men than among Negro women but much less common (about a third as common) among Negro women than among white women of similar ages. Attritional changes due to "aging" of cartilage have been held responsible by some workers, but this cause seems dubious when it is recalled that premature idiopathic Heberden nodes can affect persons in their teens, this occurred, for instance, in a girl aged 15 studied by Burt (*Rheumat Dis* 1 52 [Jan] 1939). As stated, sex seems to be an influencing factor in Monroe's series Heberden's nodes affected nine times as many women as men (Monroe Oxford Loose-Leaf Medicine, chapter XV, 1939, p 367), and in 93 per cent of Burt's 40 consecutive cases of Heberden's nodes the persons affected were females. Many patients who have Heberden's nodes remark on an apparent familial tendency to the condition. But these nodes occur so frequently that it is common to find that a parent of a patient was similarly affected. Inflammatory or degenerative changes affecting the nutrient vessels of cartilage have been considered by some investigators to be the cause of the degenerative changes in cartilage which initiate Heberden's nodes, thus Kovacs reported a decrease in the number of capillaries near Heberden's nodes (*THE JOURNAL*, Dec 8, 1934, p 1803). But other workers have found no consistent evidence of related vascular abnormalities. Heberden's nodes frequently occur among persons who use the hands excessively but seem to be as common, or even more common, among "dowagers" and other persons of the leisure classes who certainly do not traumatize the fingers much. It must be concluded that the basic cause of Heberden's nodes is not age or trauma, vascular deficiency or "hereditary articular inadequacy" but some other as yet unknown factor.

Cartilage has little or no capacity for repair, hence little can be done to replace what has been destroyed or to "cure" Heberden's nodes. But measures can be adopted which will lessen the patient's worry and pain. The patient should first be assured that he does not have a progressive, deforming disease like rheumatoid arthritis but does have a common condition which probably will be more painful to his pride than to his joints. Although trauma may not be a basic cause it is a sure aggravating factor, and the more the affected fingers are traumatized the more annoying are symptoms likely to be. Daily use of various types of physical therapy (contrast baths, paraffin packs, hot soaks and dry heat from an electric "heater") is helpful in relieving pain. Results of roentgen therapy in the main have been disappointing. Theelin recently was advised for the relief of painful swollen Heberden nodes (*St Louis K K Northwest Med* 39 452 [Dec] 1940), but its value has not been confirmed or the rationale for its use explained. Also unsubstantiated by other investigators is the claim of Elliott that the nodes can be reduced in size by the use of adhesive plaster bandages or metallic bands intermittently (*M J & Rec* 136 509 [Dec 21] 1932).

## PAINFUL NODULES OF LEGS

To the Editor—A Jewish housewife aged 46, amenorrheic for the past two years, became ill in June 1941 with pain and swelling of both legs up to the knees. This confined her to bed and the swelling subsided spontaneously. When first seen in October she had had since June pain in the left calf which became worse at night and inability to walk on the left leg. Examination revealed that the left calf was tender with a sensation of a lump in that area and that the left leg was slightly swollen. The rest of the examination gave normal results. The blood Wassermann reaction was negative; there was moderate secondary anemia and no lesions were apparent in roentgenograms of the long bones. There was a history of colitis in 1935 and of several peculiar small hard nodules on the skin, one of which after biopsy in a reputable dermatologic clinic in 1933 was diagnosed as atypical fibrosarcoma. Three such nodules were present on the left shin. The patient's brother had what was diagnosed as neurofibromatosis. Treatment with large doses of iron and injections of thiamine hydrochloride and the vitamin B complex gave no relief. Biopsy of one of the cutaneous nodules in 1941 rendered a diagnosis of benign angiofibroma. The left leg is now normal but a similar condition has developed in the calf of the right leg in which tender cordlike masses can be palpated. Edema is not present. There has been no substantial weight loss throughout the course. The patient is bedridden and unable to walk and complains of pain in the right leg.

M D New York

ANSWER—It would be more helpful toward making a correct diagnosis if more information was given as to the character of the lesions themselves and their sequelae. Was only the subcutaneous tissue involved? Was the skin freely movable? Was it discolored? Were scars or atrophy found after healing?

The nodules which were present before the attacks of pain and swelling of the legs and which were diagnosed as fibrosarcoma undoubtedly have no relation to the later events. These probably were a relatively common type of benign fibrotic tumor occurring most often on the lower extremities and known under several different names such as fibroma durum, nodular subepidermal fibrosis and histiocytoma. Tumors of this type average 1 cm in size, are firm and may be reddish brownish or purplish. They are set in the dermis and sometimes rise a little above the skin level or are flush with it. Once they attain their maximum size there is little tendency to change for long periods. They may be excised or destroyed by the cautery or by surgical diathermy. The entire tumor must be removed or destroyed otherwise it recurs.

The deeper painful swellings of the calf suggest two disorders. The first, a type of erythema induratum which appears in women of middle age with poor peripheral circulation, is particularly painful and disabling and more destructive. In the treatment of this condition one seeks to improve the circulation by appropriate measures depending on the factor impeding it. Arsenic, as in the Asiatic pill or in solution of potassium arsenite, is effectively used. Roentgen therapy is helpful.

The second disease which comes to mind is the Weber-Christian syndrome, called relapsing febrile nodular nonpurpurative panniculitis. In this the subcutaneous fat tissue is involved and the lesions are irregular or rounded bluish or erythematous nodules 0.5 to 10 cm in diameter. They appear at irregular intervals of weeks or months and are accompanied by fever and malaise. Their common site is the thighs but they may appear anywhere on the trunk and the extremities. They finally involute to leave atrophic slightly depressed scars. Women are the usual subjects. The essential tissue changes are edema and necrosis of the fatty tissue with focal inflammation. The disease has been thought by various observers to be due to iodide or bromide intolerance to infection with the tubercle bacillus or streptococci or to focal infection. Such conditions should be sought and eliminated if found and appropriate therapy employed. If none of these are found in the background it may be useful to try cautiously therapy with the sulfonamide derivatives and with roentgen rays. Otherwise rest and supportive treatment are indicated. Most of the patients recover, though there may be exacerbations for a number of years.

## SULFONAMIDES AND ROENTGEN THERAPY

To the Editor—There was a statement in the literature two years ago to the effect that patients receiving sulfonamide derivatives should not be subjected to any irradiation. Nothing has been heard to my knowledge about this issue since. If for instance these drugs have not had sufficient effect in a case of erysipelas, how long is one supposed to wait after the last dose before starting irradiation? I consider this issue important in practice and would deeply appreciate your opinion.

M D Massachusetts

ANSWER—Kelly and Dowell (*Radiology* 32:675 [June] 1939) in 1938 observed a number of patients in whom cyanosis developed after the administration of large doses of sulfanilamide. They concluded that such large doses were definitely inhibitory to any beneficial effect the roentgen rays might produce and they questioned whether anemia or other changes in the blood of the sulfanilamide cyanosed patient might prevent any such beneficial effect. Kelly and Dowell further found that sulfa-

thiazole is less objectionable, and they said that the combination of roentgen rays and sulfathiazole is still on trial.

Epstein (*J. Invest. Dermatol.* 2:43 [April] 1939), experimenting on 5 volunteers and himself, claimed to have demonstrated that sulfonamide derivatives caused definite symptoms of photosensitivity after exposure to erythema doses of ultraviolet rays. Sensitization to chemotherapy as a sequel to exposure to strong sunlight and to ultraviolet rays has been discussed by several other investigators. M. B. Marks (*J. Pediat.* 16:503 [April] 1940) reported 2 cases of cervical adenitis in which the local and general symptoms became much worse after treatment with 75 to 100 roentgens, while sulfonamide therapy was being administered and he implied that roentgen treatment and sulfonamide derivatives should not be used together. He also stated that after this sensitization has taken place a photoallergic state may exist for a considerable period. He concluded that the use of roentgen rays concurrently or shortly after sulfonamide derivatives was contraindicated, as the combination may lead to unpleasant and serious side effects.

Reimann (*Arch. Int. Med.* 68:325 [Aug.] 1941), in a review of the significant publications of 1940-1941, did not mention roentgen therapy at all. Long (*Canad. W. A. J.* 44:217 [March] 1941), in discussing the care of patients receiving sulfanilamide, stressed the importance of keeping such patients out of the direct rays of the sun and away from sources of ultraviolet rays, because a certain number who acquire a cutaneous rash in the course of therapy with sulfonamide derivatives do so because of photosensitization. He further stated that any patient receiving these drugs should stay out of the sun until three days after withdrawal of the drug. Flocks, Fellowes and Kerr (*Am. J. Roentgenol.* 44:115 [July] 1940) studied the combined action of roentgen rays and sulfanilamide on *Staphylococcus aureus*. In vivo experiments were conducted on mice in groups of 20 with an untreated control group. The combined action of the drug and the roentgen rays allowed fewer survivors than either the drug or the roentgen rays alone, and the authors concluded that they had not demonstrated a synergistic action of sulfanilamide and roentgen rays. In a case of erysipelas cited by Marks in which sulfanilamide might have caused a reaction, sulfapyridine was substituted with excellent results.

Radiologists in general apparently have not become aware of any contraindication to the use of sulfonamide medication in connection with roentgen therapy, but it would seem important that some further studies be made.

At present the opinion of Kelly and Dowell may be accepted that the combined use of roentgen rays and the sulfonamide derivatives is to be avoided. Apparently this simultaneous use causes an unexplained reaction detrimental to many patients. Sulfanilamide and the early sulfonamide derivatives are definitely incompatible with roentgen therapy. Nothing is known about the compatibility of the later derivatives at present, but roentgen therapy is not to be employed when the drugs are used. If the drugs must be administered, they should be given alone until more observations have been completed.

EFFECT OF ADMINISTRATIVE WORK ON  
MEDICAL SKILLS

To the Editor—In the past two years many army physicians with extensive clinical training and ability both regular and reserve officers have been placed in administrative positions. Often after a year or two in such positions they are returned to active clinical or surgical work. Isn't it true that they are likely to lose clinical and surgical skill by failure to practice for periods of years or months at a time?

M D Illinois

ANSWER—It is impossible to give a positive general answer to this question. It can perhaps be considered from two angles: first, sensory and tactile skill, e. g. diagnostic acumen and operating dexterity; and, second, the ability of the administrative medical officer to keep up with current advances in medical or surgical practice. Neither of these questions can be answered precisely. It would seem, however, that the finer skills of diagnosis or treatment, either medical or surgical, would become blunted by lack of practice over a period of months and it might take a variable length of time to reestablish them, depending on their nature. With regard to the second question, although it is theoretically possible for an administrative medical officer to keep up with the current literature in his field, it is doubted whether in practice this frequently occurs. On return to medical or surgical practice in the armed forces or elsewhere, therefore, a man who had been in administrative work would probably be faced with considerable extra work along both lines before he could be considered to have recaptured his original skill and mastery of current advances. This entire question deserves more adequate evaluation and might well be reviewed by the policy making officers in the Surgeon Generals' offices.

RELATION OF EXCRETION OF ARSENIC IN URINE  
TO ARSENIC POISONING

*To the Editor*—In conducting a series of examinations on men working in a chemical plant processing reftort ash, which contains insoluble compounds of lead, arsenic and cadmium, it was discovered that these men were excreting from 0.08 to 0.19 mg of arsenic per hundred cubic centimeters of urine. Other men in no way exposed to arsenic showed from 0.005 to 0.008 mg per hundred cubic centimeters, this being assumed to be normal or due to traces of arsenic in the reagents used for testing. One man, who showed local irritation of the conjunctivas, the nasal mucosa and the skin and complained of miosis, was found to be excreting 0.1 mg per hundred cubic centimeters of urine, but this amount dropped to 0.006 mg on his leaving the department. I am unable to find any statistics on the excretion of arsenic with reference to what threshold constitutes a danger signal. Suggestions will be appreciated.

M D, Ohio

*ANSWER*—No fixed amount of arsenic as detected in the urine may be accepted as the point of demarcation between arsenic absorption and clinical arsenic poisoning. A number of important factors necessitate this statement, such as arsenic tolerance and the duration of the period in which arsenic appears in the urine. In connection with recent investigations on experimental arsenic intake in human beings, as much as 23 mg of arsenic has been found in the daily output of urine without apparent arsenic poisoning. Approximately the same output continued for several days. Conversely, in known clinical arsenic poisoning as little as 1.36 mg of arsenic represented the maximum urinary content per liter during the period of subacute poisoning. Some arsenic may be found in the urine of all persons. This represents a portion of the trivial intake with ordinary food, drink and in some instances tobacco. In Washington, D. C., men and children without known exposure to arsenic presented a urinary content of 0.06 and 0.065 mg of arsenic per liter, respectively. Male consumers of apples sprayed with a spray containing some arsenic seldom show a urinary content of the poison per liter greater than 0.3 mg, although occasionally one has presented a level of a maximum of 0.7 mg. None of these consumers exhibited provable arsenic poisoning. The arsenic content of the urine of orchardists who handled arsenic sprays at the peak of exposure averaged only 0.22 mg per liter. In general it appears tenable that any value of arsenic in urine to a peak near 0.7 mg per liter may be regarded as within normal limits, although possible exception may be taken to this statement. Higher values, up to about 3 mg, may be regarded as representing an intake of arsenic unusual and undesirable except in connection with arsenical therapy. Persistent output on this order probably is of clinical significance. In the present instance the detection of 0.19 mg of arsenic per hundred cubic centimeters of urine is likely to be associated with evidence of intoxication, although single tests are of limited value. When exposure has persisted over a long time, examination of the arsenic content of the hair may be of greater diagnostic value. With due regard for the rate of growth of hair, samples may be collected at different lengths of the hair growth, which procedure may yield values for different time periods.

## CARE OF CHILD WITH BIRTH PALSY

*To the Editor*—Kindly advise me if there are books or pamphlets available on the care of the child with mild spastic (birth palsy) paralysis in the home by the parents.

F H Hodges, M D, Pikeville, Ky

*ANSWER*—"Born That Way," by Dr. Earl R. Carlson (New York, John Day Company, 1941), embodies the experience of a patient who is a doctor. He states that the purpose is to "hearten and help every person suffering from a handicap, whether physical or mental." Dr. Carlson has spastic paralysis himself and is an authority in this field.

Another book for the lay person used by nonmedical workers with spastic paralysis is "New Pathways in the Treatment of Children with Spastic Palsy," by Gladys Gage Rogers and Leah C. Thomas (New York, Macmillan Company, 1935).

Another book that may prove of some value is "A Primer on the Prevention of Deformity in Childhood," by Richard B. Raney, M.D., published by the National Society for Crippled Children in the United States of America, Inc., Elyria, Ohio. The instruction given is written up in the simplest manner, so that this handbook can be used by other than medical men.

## TOXIC POSSIBILITIES OF SULFUR PURIFICATION

*To the Editor*—Kindly send me information concerning the toxic or poisoning symptoms which may occur to one who fires a crucible in the process of sulfur purification. How may these symptoms be avoided?

M D, New Jersey

*ANSWER*—In the smelting and purification of sulfur there are so many special procedures possible that this reply deals only with the simple procedure of sulfur purification by settling and skimming in the molten state. Sulfur from Sicily and possibly other Mediterranean sources is admixed with gypsum, punice and marl. On heating, this gangue, depending on its weight, either settles out or reaches the surface as a slag. Some sulfurs contain arsenic, and this impurity is not necessarily removed in the manner described. Sulfur from the Louisiana-Texas area of this country usually is much purer and as mined may consist of more than 99 per cent of the pure element. Subsequent heat treatment may not be so much for the purposes of purification as for the preparation of rolled sulfur or flowers of sulfur. In all of these simple operations the chief offending material is sulfur dioxide, although under some circumstances hydrogen sulfide may be evolved. Under some circumstances where the cost of fuel is high the sulfur itself is burned in order to procure the molten state for purification. In this manner as much as one third of the sulfur may be lost, and in this country such a step is wasteful. In the absence of exhaust systems some 6 per cent of sulfur dioxide may contaminate the atmosphere. Primarily, sulfur dioxide is a respiratory tract irritant. As little as 0.001 per cent may produce coughing, and slightly higher concentrations may produce conjunctivitis, pharyngitis, bronchitis and the like. Prevention centers about the nonproduction of sulfur dioxide, or, if this is inevitable, the collection and removal of the gas to non-dangerous areas. It is possible to conduct this operation in closed systems, although this may not be necessary since exhaust facilities for open systems may prove efficacious. The tolerable limit being near 10 parts per million, efforts should be made to maintain working conditions approximating this level. Under some circumstances it may be necessary to rule out the presence of arsenic and hydrogen sulfide. If present in harmful quantities, additional measures as indicated should be introduced to eliminate these unwanted exposures.

## HYPERTENSION AND VITAMIN A

*To the Editor*—After seeing a report on the treatment of hypertension by high concentration of vitamin A, I decided to try it in 1 case. Can you give me any information as to the toxic effects of overdosage of vitamin A and whether or not 200,000 units could be given indefinitely? I shall appreciate any information or references.

H F Binswanger, M D, Chicago

*ANSWER*—From a practical point of view the toxicity of vitamin A is negligible. There is no important reason save cost why 200,000 units might not be given orally daily for an indefinite period. Whether or not this will have therapeutic value remains to be demonstrated.

## ANTISERUM FOR DRUG ADDICTION

*To the Editor*—In *Queries and Minor Notes* in *The Journal*, Sept. 27, 1941, page 1141, there was published an answer concerning antiserum for drug addiction in which a paper by Leo Hirschlof was mentioned. May I add that J. Morgenroth (Berl. klin. Wchnschr. 40: 471, 1903) was able to refute incontestably the production of an "antitoxic serum" as pretended by Hirschlof as well as by Volenti (Arch. di farmacol. sper. 17: 248, 1914, Arch. f. exper. Poth u. Pharmacol. 75: 437, 1914). Also Pellini (1914, Arch. f. exper. Poth u. Pharmacol. 75: 437, 1914). Also Pellini and Greenfield (Narcotic Drug Addiction. I. Formation of Protective Substances Against Morphine, Arch. Int. Med. 26: 279 (Sept. 1920) as well as Hoefer and Herzfeld (Arch. f. exper. Poth u. Pharmacol. 99: 383, 1923) could not obtain an increase in the resistance after the injection of serum or casein. It must be said that there are no scientific principles on which the lessons of immunology can be in any way applied to the treatment of alkaloid addicts, and every action described as having been obtained with serotherapy is the typical action of plain serum. In such cases, the treatment therefore is merely the so-called protein therapy.

P O Wolff, M D, Buenos Aires, Argentina

## POSSIBLE DEATH FROM "ETHER CONVULSIONS"

*To the Editor*—In reference to the answer to the question on possible death from "ether convulsions" in *The Journal*, March 14, 1942, page 935, I call it to your attention that the intravenous injection of ether is regarded by many anesthetists as a specific treatment for this condition. There is also considerable evidence that a mask or other breathing apparatus beyond the lips should be removed (in order to prevent building up of carbon dioxide, thought to be one potent precipitating factor of convulsions under anesthesia) and that addition of oxygen to the inhaled atmosphere, as by a nasopharyngeal catheter, may be of benefit.

## TRAUMA OF THE HEART DUE TO NONPENETRATING CHEST INJURIES

REPORT OF CASES WITH RECOVERY  
OR LONG SURVIVAL

LOUIS H SIGLER M.D.

BROOKLYN

Trauma of the heart and adjoining structures caused by nonpenetrating injuries to the chest and other parts of the body is often overlooked because of the prevailing idea that the chest wall and the cushion effect of the lungs prevent such trauma. This paper attempts to discard this idea and help establish criteria by which the condition may be recognized.

The heart and adjoining structures are affected much more frequently in the course of bodily injury than the literature would indicate because only the most serious injuries or cases of fatal involvement appear to attract attention and are recorded. Thus of 197 cases collected from the literature by Warburg<sup>1</sup> up to 1938 there were only 9 survivals for one and one-quarter years or more and in the rest death occurred either immediately or a short time after the accident. Of 168 cases collected from the literature by Bright and Beck<sup>2</sup> there were only 12 survivals and recoveries. In the remaining cases death occurred soon after the accident. Cases are not reported in which the cardiac injury was mild because such cases do not yield sufficient clinical signs to attract the attention of the average physician who is not trained to recognize damage to the cardiovascular system.

It stands to reason that reports such as these are not satisfactory for determining the incidence of cardiac damage in bodily injuries.

### EXPERIMENTAL PRODUCTION OF HEART INJURY

Before I discuss the clinical features of traumatic injury to the heart it is of interest to review in brief some of the available experimental studies. Of these the work of Schlomka,<sup>3</sup> Kulbs and Straus,<sup>4</sup> Bright and Beck,<sup>2</sup> and Kissane, Fidler and Koons<sup>5</sup> are the outstanding contributions.

From the Cardiac Service Department of Medicine Coney Island Hospital.

Dr. George Webb gave the author the privilege of observing patient 3 who was in his surgical service at the Coney Island Hospital. Dr. Hans Gottlieb reviewed some of the foreign literature used as reference.

<sup>3</sup> Schlomka, G. *Commotio cordis*. *Klin Wchnschr* 12:1677, 1933. *Influence of Blunt Injuries on Heart in Sensitized Animals*. *Experimental Studies*. *Ztschr f d ges exper Med* 92:522, 1934.

<sup>4</sup> Kulbs, F. and Straus, L. H. *Heart and Trauma*. *Experimental Investigation*. *Klin Wchnschr* 11:1572-1574, 1932.

<sup>5</sup> Kissane, R. W., Fidler, R. S. and Koons, R. A. *Electrocardiographic Change Following Injury to Dog*. *Ann Int Med* 11:907, 1937.

Schlomka applied blows to the chests of rabbits and cats by a small wooden mallet and studied their effects on the cardiovascular system. Some of the animals died during the process from ventricular fibrillation, severe conduction disturbances or failure of the right side of the heart. Most animals survived and showed various electrocardiographic abnormalities as ectopic contractions, conduction disturbances, changes in the electrical axis and in the R-T segment and T wave, the last two of which resembled those of coronary occlusion. There was a drop in the arterial blood pressure and a rise in venous pressure. Acute cardiac dilatation, mainly right ventricular, was observed in many animals soon after the injury and in some later after the regression of symptoms. Cutting off all nerve connections with the heart before the experiment did not alter the effects of the blow.

The most interesting observation was that postmortem studies of the heart revealed no structural damage in 90 per cent of cases, even in animals that died during the experiment. Only 10 per cent showed some abnormalities such as small hemorrhages in the myocardium or in the conduction system.

Schlomka concluded that the cardiac manifestations of trauma are due to coronary spasm producing myocardial ischemia. The spasm is caused by the direct effect of the vibratory force on the coronary vessels and not by reflex action.

In other experiments the same author showed that animals sensitized with heterogen serum were more subject to cardiac injury by blows to the chest than were normal animals and the damage was greater. Coronary spasm evidently is more easily induced under such a state and is more prolonged.

Kulbs and Straus observed that injury to the heart induced by trauma is more apt to occur in animals under the effect of digitalis, thyroxin and epinephrine, which increase the sensitivity of the heart.

Bright and Beck applied direct strokes with a metal dilator to the exposed hearts of 25 dogs. Three died during the experiment—1 of rupture of the heart and 2 of ventricular fibrillation. The rest survived the experiment and showed an increase in the heart rate, a drop in the arterial and a rise in the venous pressure, faint and distant cardiac sounds of the "tick-tack" type and swelling, discoloration and extravasation of blood in the myocardium. Half of the dogs showed evidence of blood stained pericardial effusion. Various arrhythmias were observed and the electrocardiogram showed slurring and notching of the QRS complex, with a high R-T take-off and negative T wave, all of which returned to normal in a few weeks.

At autopsy two or three months after injury the hearts showed scarring of the myocardium in 14 instances. The rest of the hearts showed no trace of injury.

Kissane, Fidler and Koons did electrocardiographic studies on 15 dogs traumatized by blows on the chest. The most frequent manifestations were changes in the QRS-T segment and in the T wave, which appeared a few minutes to a few hours after the injury. Various arrhythmias were observed and ventricular fibrillation occurred.

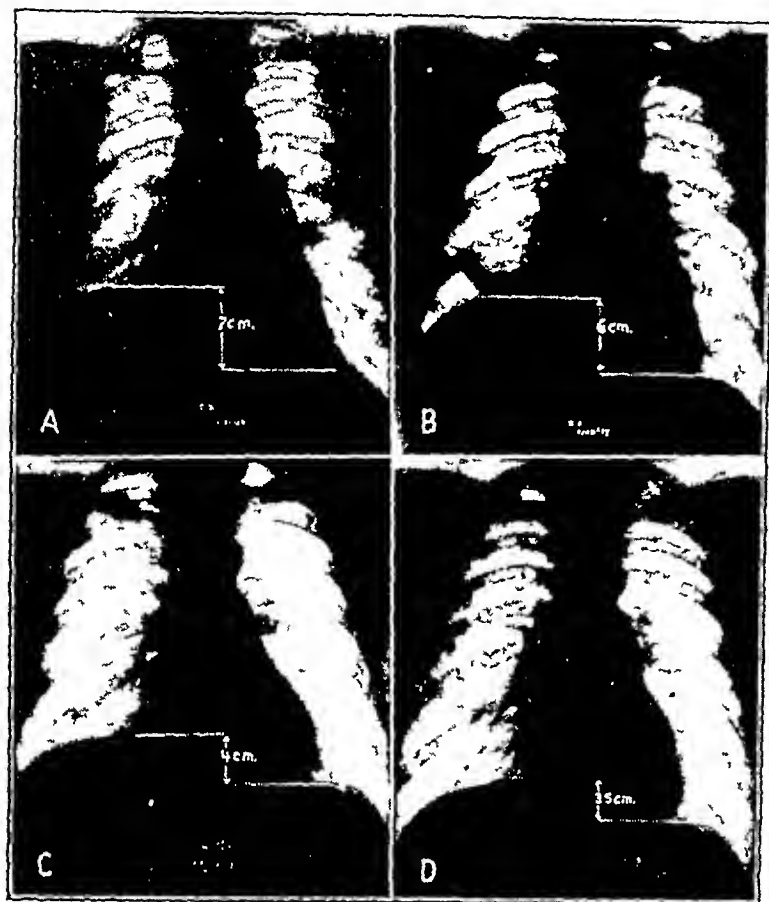

Fig 1 (case 1)—Chest, (A) one week, (B) one month, (C) four months and (D) one year after the accident. The distance between the right and the left diaphragmatic dome is shown in centimeters.

#### TYPES OF IMPACTS PRODUCING CARDIAC INJURY IN MAN

The types of blow or impact that may result in cardiac injury in man are (1) direct blow to the chest, especially if applied to the precordial region, (2) compression of the chest in the anteroposterior position by two solid objects, (3) sudden extreme increase in intra-abdominal pressure by external violence, (4) lifting of an extremely heavy object or other severe strain thrown on the body, (5) disturbance of the vagosympathetic system to the heart produced either by direct injury or reflexly.

It must be stressed that it is not the latent force but the velocity of travel of the force when it strikes the body which produces the injury.

Factors which help increase or diminish the effects of the striking force on the heart are

1 The flexibility and resilience of the thoracic cage. In youth the chest is much more resilient than in advancing age, hence a striking force is more apt to damage the heart in a young than in an old person.

2 The presence of coronary disease in advanced age is a sensitizing factor for the production of cardiac disturbances, if not actual cardiac damage, by comparatively little force.

3 A definite psychoneurotic tendency or vagosympathetic imbalance is a factor that lends itself to greater cardiac disturbances produced by an injury.

#### STRUCTURAL CARDIOVASCULAR DAMAGE CAUSED BY INJURY

Damage may occur in the pericardium, myocardium, coronary vessels, valves, the great vessels springing from the heart and the adjoining organs, as the lungs and pleurae. In many cases more than one of these structures may be involved. It is interesting to find that, as in experimental animals, some patients who die of cardiac injury show no organic changes on postmortem examination, for example, the instance reported by Deutsch<sup>6</sup> in which a boxer aged 26 died soon after he received a blow to the chest. The autopsy revealed no structural damage of the heart or other organs, death being due, according to the author, to ventricular fibrillation.

Pericardial damage may consist of pericarditis with or without effusion, or of pericardial rupture or of hemopericardium. The last is illustrated by Moullin's case.<sup>7</sup> A man aged 20 was hit over the sternum with a football. A massive hemopericardium developed requiring many aspirations. He made a complete recovery.

Late sequelae of pericardial involvement may be massive constrictive pericarditis, as in the case reported by Glenn.<sup>8</sup> A salesman aged 46 injured his chest in an automobile accident. He was well enough to go to work two months later. Two years after the accident nausea, persistent precordial pain with radiation to the left shoulder, a paradoxical pulse, orthopnea and abnormalities in the electrocardiogram gradually developed. He died a year later. The autopsy revealed a densely adherent pericardium with massive adhesions of the right lung and the diaphragm and narrowing of the lumen of the inferior vena cava. The heart and valves were normal.

Myocardial injuries may be in the form of contusions, lacerations and temporary or prolonged ischemia with infarction due to transient or permanent involvement of the coronary system respectively.

Myocardial contusions, according to Bright and Beck,<sup>2</sup> may occur frequently. In many cases the damage is overlooked. In some it may result in death, as in the case recently reported by Barber and Osborn.<sup>9</sup> A sailor

Fig 2 (case 1)—Tracings taken over a period of more than 1 year. For description see the text.

aged 22 was found in an unconscious state and died of pulmonary edema four hours later. It was learned that a wheel of a loaded 5 ton trailer passed over the front of the thorax. Autopsy showed acute edema of the

9 Barber, H., and Osborn, G. R. Brit Heart J 3: 127, 1941.

lung and severe contusion of the left ventricle and many small groups of heart muscle fibers were ruptured. There was no enlargement of the heart and the pericardium was normal.

Lacerations of the myocardium may be partial—not involving the entire thickness of the muscle wall—or complete—the rupture penetrating the entire thickness of the wall. It may involve any of the four chambers. The majority of reported cardiac injuries which result in death consist of rupture of the heart.

In most cases rupture occurs during the accident and death follows soon after. In some cases rupture may occur later as in the case reported by Gunewardene.<sup>10</sup> A boy aged 9 years had his chest compressed against a wall by a cart. He showed no external injuries, felt well and attended school the following day. Ten days later while playing he suddenly experienced pain and died instantly. Autopsy showed rupture of the left ventricle.

Rupture of the heart may occur not only from direct violence to the chest but also from a fall from some height, as in the case reported by Howat<sup>11</sup> or from striking other parts of the body as the pelvis in the case reported by Saphir.<sup>12</sup> The rupture may occasionally involve the interventricular septum as in the case reported by Wischegordzewa<sup>13</sup> and in case 3 of this paper.

Trauma to the coronary vessels resulting in myocardial damage appears to occur frequently, judging from the reported cases in recent literature. In many cases the myocardial damage is presumably due to prolonged coronary angiospasm as in animal experimentation, since no pathologic changes in the coronary vessels may be found on postmortem examination. The case reports of Fischer<sup>14</sup> and Schwach<sup>15</sup> are examples. In some cases there may be clinical and electrocardiographic evidence of myocardial infarction due to coronary occlusion as in cases 1 and 4, and in those reported by Kampmann<sup>16</sup>, Kienle<sup>17</sup> and Schmincke.<sup>18</sup> The causes of coronary occlusion may be direct trauma of a coronary vessel with intravascular thrombosis or compression of a coronary artery by hemorrhage adjacent to the vessel wall or capillary rupture and intimal hemorrhage in the artery resulting in the thrombosis as shown by Paterson.<sup>19</sup> The last is more apt to occur in cases of coronary sclerosis, in which a rich capillary network has been observed by Winternitz and his co-workers.<sup>20</sup> It is possible that in some cases showing clinical and electrocardiographic evidence of coronary occlusion the findings are due to localized contusion of the heart muscle rather than to intarction caused by occlusion.

Rupture of valves occurs infrequently. Muller<sup>21</sup> found no such injury in 21 cases of cardiac damage

that came to autopsy. Adam,<sup>22</sup> however, collected 14 such cases from the literature. Other cases were reported by Reinhold,<sup>23</sup> Agostoni,<sup>24</sup> Elkin,<sup>25</sup> Barber and Osborn<sup>26</sup> and others. Case 5 in this paper is an example.

Injury to the great vessels may rarely occur and lead to thrombosis. A case of pulmonary artery throm-

Fig. 3 (case 2)—Auricular flutter, auricular rate about 246, ventricular rate 90 to 110 with a 2:1 and 3:1 ratio.

bosis following a thoracic injury is cited by Hart<sup>27</sup> and one of superior vena cava thrombosis by Ochsner and Dixon.<sup>28</sup>

Late effects of cardiac injury that may be observed many months or years after an accident are ventricular aneurysm and calcification of the heart, pericardium and adjoining structures. An example is case 2. Others are reported by Soleil,<sup>29</sup> Joachim and Mays<sup>30</sup> and Mille.<sup>31</sup>

#### CLINICAL MANIFESTATIONS OF CARDIAC INJURY

Injury to the heart may occur without any subjective or objective manifestations. This is especially true if the injury is not severe. If carefully followed, however, even the mild grades of injury may show manifestations by which the injury can be recognized.

The first manifestation, especially if the injury is severe, may be a dazed feeling, dizziness or complete loss of consciousness. This occurs immediately after the injury or later and usually lasts a short time unless the accident is fatal in which event the patient may never be aroused. This may be followed by mild, vague or dull epigastric or precordial discomfort or pain. Several hours or days later after a "latent period," the typical anginal syndrome may develop, coming on after excitement or exertion. In some it is preceded by a severe spontaneous attack lasting many hours due most

likely to an occlusive process or to infarction caused by persistent angiospasm. In addition to or instead of pain there may be substernal oppression, choking sensation or extreme weakness, associated with cold, clammy perspiration. The anginal syndrome may recur thereafter for many months or years, as in case 4.

Kohn<sup>32</sup> was the first to call attention to so-called traumatic angina pectoris, although other writers before him reported cases which conform to the description. Recently several cases were reported by Barber,<sup>33</sup> Campbell<sup>34</sup> and Boas.<sup>35</sup>

Next to the anginal syndrome, dyspnea is the most frequent symptom. This usually occurs only on exertion if the damage to the heart is not severe. If damage is severe or if massive pericardial effusion is present, dyspnea may occur even at rest.

Other complaints may be cough, palpitation, a "fluttering" feeling, weakness, nausea and even vomiting. These are more apt to occur if any type of tachycardia or arrhythmia develops.

appear with recovery, or they may persist in greater or less degree, especially if valvular damage has occurred.

Of the various arrhythmias, the ectopic contractions, auricular fibrillation, auricular flutter and those caused by heart block have been reported and have also been observed by me. These arrhythmias may occur at times in the absence of demonstrable cardiac damage and may be induced by injuries which could not conceivably produce such damage. Thus auricular fibrillation was observed by Sigler and Schneider<sup>36</sup> and by Hay and Jones<sup>37</sup> after such a remote cardiac insult as that caused by electric shock. The various arrhythmias may develop immediately or a long time after the accident.

The electrocardiographic changes observed are similar to those seen in experimental animals previously discussed. Besides the various arrhythmias, and various degrees of auriculoventricular block, abnormalities in the QRS complex, in the QRS-T segment and in the T wave may occur. The changes are usually progressive and may be exactly like those seen in infarcts.

Fig. 4 (case 2)—A, anteroposterior view, B, left lateral view, and C, right oblique view. Areas of calcification are shown by the white patches and streaks in the heart shadow. There is a moderate cardiac enlargement, mainly to the left.

The objective manifestations that may appear a short time after the accident are circulatory collapse, characterized by a rapid and thready pulse, a drop in blood pressure, pallor, and cold, clammy perspiration. A rise in temperature and an increase in the leukocyte count and in the rate of sedimentation of the blood cells may also occur in the cases of severe involvement within a day or two after the accident or later.

The area of cardiac dulness and its shadow on the roentgenogram may remain perfectly normal throughout the period of damage. This is true especially if pericardial effusion is not present. In some cases this area becomes enlarged, owing to pericardial effusion or to cardiac dilatation. The first sound may be shortened, muffled, weakened or greatly diminished in intensity and at times hardly audible. A gallop rhythm, as well as a pericardial friction rub, may appear and persist at times many days. Endocardial murmurs may develop which vary in intensity, quality, location and radiation, depending on the site of structural damage. These may dis-

appear in the anterior or posterior wall of the left ventricle, which they may indeed represent. Examples are shown in figures 2, 5 and 7 and in the reports of Kampmann,<sup>17</sup> Kienle<sup>17</sup> and others.

The diagnosis of trauma of the heart should not be difficult to make if one bears the condition in mind and if each case of bodily injury is submitted to repeated search for active signs and symptoms of cardiac disease and electrocardiographic changes. Heart disease due to other causes must be ruled out in every case.

#### REPORT OF CASES

**CASE 1**—A white man aged 47, an electrician, was beaten up by gangsters to the point of unconsciousness. When he regained consciousness he complained of slight pain in the chest and various parts of the body. Two days later the pain suddenly became severe and was associated with pallor, cold clammy perspiration and a drop in blood pressure. The following day there was an elevation in temperature to 102 F, a moderate leukocytosis and an increase of the blood cell sedimentation rate. His family and his past personal history were negative. He had never had heart disease before nor any condition which would predispose to such disease.

33 Barber, Hugh. Trauma of the Heart, *Brit. M. J.* 1:433, 1938.

34 Campbell, M. Angina Pectoris Following a Crushing Accident, *Brit. Heart J.* 1:177, 1939.

35 Boas, E. P. Angina Pectoris and Cardiac Infarction from Trauma or Unusual Effort, *J. A. M. A.* 112:1187, 1939.

36 Sigler, L. H., and Schneider, J. J. Electrocardiogram in a Case of Electric Shock, *Am. Heart J.* 11:236, 1936.

37 Hay, J., and Jones, H. W. *Brit. M. J.* 1:559, 1927.

I saw him in consultation with his family physician, Dr Eli Eisenberg, about one week after the accident. At that time he showed no evidence of injury to the chest wall or other superficial evidence except for slight ecchymosis of the lids. The rate was 77 beats a minute and the rhythm regular. The first sound was somewhat muffled and the pulmonary second sound greatly accentuated. Murmurs were not heard. The lungs showed absent breath sounds and flatness from about the sixth rib downward posteriorly and at a corresponding level anteriorly and laterally, and there was diminished mobility of the chest wall in that region during respiration. The abdomen, pelvis and extremities were normal.

My impression was that he had sustained an injury to the heart and in view of the pulmonary findings I considered in addition the presence of pulmonary atelectasis of the lower lobe of the right lung caused by bronchial occlusion due to hemorrhage.

His symptoms gradually subsided and there was a progressive increase in the expansion of the lower lobe of the right lung and improvement in the character of the first heart sounds. A slight cough with very slight bloody expectoration continued for about three months at the end of which time expansion of the lung had definitely increased. At the end of one year he had completely recovered.

The electrocardiographic tracings speak for progressive changes due to myocardial infarction, involving mainly the anterior wall of the left ventricle but also partly the posterior wall.

**CASE 2**—A white man aged 44, a plasterer, fell off a scaffold and hit the left precordial region against his right fist, which was pinned between his chest and the ground. He was unconscious for about five minutes. When aroused, he complained of extreme weakness and some precordial pain but managed to finish his day's work.

Toward evening the pain became severe and the weakness more pronounced. He was treated by a physician for about six months for a supposed injury to the chest wall and left shoulder the physician not realizing that there was damage to the heart. Gradually the pain and weakness greatly subsided but would appear when the patient walked two or three blocks or up one flight of stairs. This persisted for about three and one-half years, when one day a spontaneous attack of extreme weakness and severe palpitation suddenly developed. He was removed to a hospital at which he stayed thirty-one days.

The report submitted to me from that hospital was that repeated readings (electrocardiogram) consistently show auricular flutter, auricular rate at 250, ventricular rate from 55 to 136. The hospital diagnosis was coronary thrombosis which

Fig 5 (case 3)—Chest (A) two weeks (B) five weeks and (C) three and one-half months after the accident.

Figure 1 shows four roentgen views obtained one week, one month, four months and one year respectively after the accident. None show any increase in the size of the heart. The right dome of the diaphragm is definitely higher than the left in A and in a somewhat less degree in B where a triangular area of opacity is seen representing atelectasis of the right middle lobe which is apparently beginning to expand. In view C the right dome of the diaphragm is much lower and the area of opacity is not seen. In view D the right diaphragmatic dome is at approximately a normal level. Figure 2 shows six electrocardiographic tracings obtained between one week and twenty-six months after the accident. In A, obtained one week after the accident, the QRS complex is of low voltage in all standard leads and the T wave is diphasic in the second lead and negative in the third. The precordial lead 4 shows a negative QRS deflection, with the absence of an R wave and there is a high QRS-T take-off. In B, obtained one month later, the T wave is negative in the first, second and fourth leads and there are some changes in the QRS complex, with elevation and coving of the QRS-T segment in the fourth lead. In C, obtained two months later, the T wave in the first lead is slightly positive while in the fourth it is still definitely negative but the QRS-T segment in the latter now approaches the isoelectric level. In D, obtained about six months after C, the T wave in the standard leads is normal while in the fourth lead it is still slightly negative. The QRS complex in all leads has increased in voltage. In E and F, obtained about ten and seventeen months respectively after D, the T wave in the fourth lead is somewhat diphasic.

was most likely based on the symptoms, for no mention was made in the report of other clinical or electrocardiographic changes that would substantiate this diagnosis.

Following his discharge from the hospital the symptoms persisted and he had an occasional fainting sensation. The dyspnea and palpitation became more severe from time to time. On one occasion he was admitted to the Coney Island Hospital, where he stayed several weeks during which time repeated electrocardiograms showed auricular flutter with a variable 2:1 and 3:1 ratio as in figure 3.

Teleroentgenograms in the anteroposterior, right oblique and left lateral positions are shown in figure 4, all views of which show areas of calcification in the heart muscle and pericardium. I had seen the patient in consultation on and off for a period of about thirteen months since the onset of auricular flutter, and each time flutter persisted. More than two years later I was told that he was in a veterans hospital, that the flutter still persisted and that he presented significant myocardial failure.

There was no history of heart disease previous to the accident or of any other illness which might have predisposed to such disease. The only sickness that he had had was pneumonia, fourteen years before the accident, from which he had fully recovered with no sequelae. He always worked hard before the accident and never had any complaints.

Not at any time after the accident was there clinical or roentgen evidence of fracture of any of the bones of the chest or any other injury to the chest wall.

This case, then, may be considered one of contusion of the heart and pericardium resulting in the anginal syndrome. Gradual calcification of the myocardium and pericardium occurred and resulted in the onset of auricular flutter about three and one-half years after the accident, when calcification reached a degree sufficient to produce irritation of the auricles. The subse-

Fig. 6 (case 3)—A, one month after the accident. The T wave is negative in the first and second lead. B, two weeks after A. The T wave is more negative in the second lead and the QRS voltage is somewhat higher in all leads. C, four months after the accident. The T waves in the first and second lead are positive but the voltage is low in the former. The tracing is approaching the normal.

quent downward course was due to persistent auricular flutter, which lasted about two years and at this writing is still continuing.

**CASE 3**—A youth aged 21, a salesman, while driving his automobile collided with a street stanchion and was thrown against the steering wheel and the windshield. He was momentarily unconscious and when aroused complained of pain in the sternal region. He was admitted to the service of Dr. George Webb at the Coney Island Hospital.

His family and his previous personal history were negative. He had had no heart disease before nor any other condition that would produce heart disease.

On admission he was fairly well oriented. His heart rate was 120 a minute, the pulse was of poor quality and his blood pressure was 82 systolic and 64 diastolic. Several teeth were broken and there was bleeding from the lips.

The following day the shock became more severe, the pulse was very weak, the blood pressure was unobtainable and the heart sounds were inaudible. Neurologically he showed horizontal nystagmus, definite engorgement of the retinal vessels, nuchal rigidity, a moderate Kernig sign, absence of abdominal reflexes and bilateral Oppenheim reflexes. All deep reflexes were depressed. He showed extreme confusion and disorientation. A diagnosis of multiple cerebral hemorrhage was made, but the spinal fluid was under normal pressure and showed no abnormal conditions.

His cerebral symptoms gradually improved. The precordial pain, however, persisted. Examination six days after admission revealed the heart to be of normal size, the rate 115 a minute and the rhythm regular. The first sound at the apex was accentuated, as was the second sound at the base. There was a short presystolic gallop rhythm and a long soft systolic murmur heard between the third left costosternal junction and the apex.

The temperature reached a maximum of 103 F about ten days later. Dyspnea became severe. The heart progressively increased in size. A pericardial friction rub developed about fourteen days after admission and lasted three weeks, its maximum intensity being over the midsternum. The signs and symptoms gradually began to subside and complete clinical recovery occurred about four months after the accident. His heart remained slightly enlarged to the right, as shown in figure 5C, but the sounds were of good quality, and a short soft systolic murmur was heard over the left sternal border in the third interspace.

Electrocardiograms obtained one month, six weeks and four months after the accident are shown in A, B and C respectively of figure 6. The T wave was negative in the second and third leads in A and B and returned to nearly normal in C.

Roentgenograms of the chest obtained about two weeks, five weeks and three and one-half months after the accident are shown in figure 5A, B and C, respectively. The heart shadow is definitely enlarged in A, with a suggestion of the presence of pericardial effusion. In B, the shadow has greatly receded but considerable enlargement is still present to the right. In C, the transverse shadow of the heart bears a normal relationship to the transverse diameter of the chest, but there is some bulging of the right border.

I was informed four years after the accident that the patient's health was good and that he had no complaints.

This is a case, then, of severe myocardial contusion, pericarditis with effusion and possible rupture of the intraventricular septum, following an accident, without injury to the chest wall.

**CASE 4**—A man aged 52, a theater manager, while walking to the moving picture operator's booth in a dark corridor tripped against a stack of reels and fell to the floor. He was unconscious for some time, and when consciousness returned he complained of severe pain in the left shoulder and in the right ankle. He was removed to a hospital in severe shock, and there a fracture of the right fibula was found. An electrocardiogram taken later showed myocardial infarction.

Since then he has been subject to recurring attacks of retrosternal pain radiating to the left arm and epigastrium, which appears on the slightest exertion.

The heart is of normal size and shape, and rhythm is always regular. The first heart sound is diminished in intensity. The lungs show no abnormality.

Repeated electrocardiograms taken over a period of eighteen months, three of which are shown in figure 7, reveal evidence of infarction in the posterior basal wall of the left ventricle which is evidently organized and permanent. There is a persistence of the QsTs type of waves of almost the same appearance, except for slight variation in the voltage of the T wave.

There was nothing in the past history that would predispose to heart disease. He had always worked hard and never had any complaints before the accident. He has some peripheral

Fig. 7 (case 4)—A, about four weeks after the accident. The QsTs type of complex. The R T segment in the second and third leads is slightly elevated. B, about seven months after the accident. The T wave is less negative in the second and third leads and the fourth lead which would indicate some improvement in the condition. C, about twenty months after the accident. The tracings are practically identical with those of B except for the T wave in the second lead which is slightly less negative.

arteriosclerosis, and it is likely that he had antecedent coronary sclerosis, although he had never had the anginal syndrome before.

At the present writing, about nineteen months after the accident, he is still subject to the anginal syndrome.

The case then is one of infarction of the posterior wall of the left ventricle caused by injury to the heart. The infarction was undoubtedly due to coronary artery thrombosis which was precipitated by the injury.

CASE 5—A man aged 39, while carrying a ladder with another person through a passageway, was thrown against an iron fence when a heavy gate was unhinged and fell on the patient the full weight of the gate pressing on his back. Sharp precordial pain soon developed which radiated to the back, and he was obliged to quit work. Since then the pain would come on after comparatively slight exertion and would be associated at times with palpitation.

I had seen him about five months after the accident, when there was a soft diastolic murmur at the third left interspace close to the sternum which radiated to the apex and to the second right interspace. There was some left ventricular enlargement and the ascending aorta showed a slight bulge fluoroscopically.

There was no history of syphilis and the blood serologic reaction was negative. There was no history of rheumatic fever or any other disease that might predispose to the aortic insufficiency which the findings indicated. His age would rule out arteriosclerosis as a possible etiologic factor, and there was no evidence of arteriosclerotic changes in the palpable vessels and in the visible vessels in the retina. Just before the accident he had passed an examination for life insurance.

An interesting feature observed the first time that I examined him was that his blood pressure was normal being 118 systolic and 70 diastolic with a pulse pressure of 48. This is a very unusual finding in aortic insufficiency. About one year later, however, his blood pressure was 150 systolic and 68 diastolic, with a pulse pressure of 82 which is commonly seen in this condition. The ascending part of the aorta on this examination showed greater dilatation and a systolic murmur was heard in addition to the diastolic murmur previously found. The size of the left ventricle likewise has increased.

The rapid progression of signs further substantiated the diagnosis of traumatic damage to the aortic valve with the onset of aortic insufficiency. Early some of the characteristic features were absent and it was only after the persistence of the condition for about one and one-half years that all features developed.

#### SUMMARY

Trauma of the heart and the adjoining structures caused by blows to the chest or to distant parts of the body occurs much more often than the literature would indicate. This paper describes briefly the results of the available experimental work on the subject, the types of force that may produce cardiac injury in man and the resulting forms of injury. The symptom complex and electrocardiographic manifestations of cardiac injury are briefly described. Emphasis is placed on the importance of bearing in mind the possibility that trauma of the heart may occur in any bodily injury and such patients be subjected to frequent cardiac examinations including repeated electrocardiographic studies.

**An Intellectual Challenge**—There are supposed to be 635,013,559,600 possible bridge hands that any one person might have dealt to him. And even if he should in a lifetime of bridge playing, hold the same hand twice the other three hands would be different and anyway he wouldn't remember the first time. Hence every bridge hand and every bridge situation is different and absolutely new, whereas in chess or checkers, for example each game starts with the identical situation. It is this inexhaustible newness of situations which provides bridge with one of its chief appeals—an intellectual challenge.—Knight, Robert P. Contract Bridge *Bull. Menninger Clin.* 6:68 (May) 1942.

## HEAD INJURIES

### A NEW TREATMENT FOR POSTCONCUSSIONAL HEADACHES AND DIZZINESS, PRELIMINARY REPORT

J. Y. MALONE, M.D.

MILWAUKEE

The postconcussional syndrome is being recognized more and more frequently as an oft occurring sequela of a concussion of the brain. It is usually characterized by a triad of symptoms which includes headache, dizziness and emotional disturbances. To gain a clear conception of this common condition it is first necessary to define concussion. One of the better definitions of concussion was presented by Strauss and Savitsky<sup>1</sup> as "a series of events resulting from a blow to the head severe enough to cause disruption of intracranial equilibrium." This statement is broad enough to allow for many of the theories of its pathophysiology.<sup>2</sup>

A general discussion of this disorder and its treatment seems timely, since undoubtedly there will soon be many more patients with this condition owing to the increased frequency of concussion resulting from war injuries. Unfortunately a great number of these patients are labeled neurotic. This is because psychogenic factors very frequently complicate the clinical picture if social or economic factors persist too long. Therefore any treatment which speeds recovery tends to eliminate the development of psychogenic factors.

#### PATHOLOGY

Neurosurgeons<sup>3</sup> have repeatedly reported that during an operation with the patient under local anesthesia no pain is felt except when certain well defined areas are touched. McNaughton<sup>4</sup> proved this to be the case. He found that some of the arteries, especially the middle meningeal, carry with them a plexus of nerves which when stimulated gives rise to the sensation of pain. The dura mater is insensitive to pressure, traction, heat and electrical stimulation except in a few small areas. The dural sinuses and cerebral arteries are similarly constituted, and the brain tissue is devoid of sensation.

The pathologic changes involved in this syndrome are not very clear. A number of investigators believe the disorder is primarily on an organic basis, whereas equally competent observers advance indisputable evidence of its being a pathophysiologic derangement. Penfield<sup>5</sup> has hypothesized that the development of dural adhesions is the basic cause of the symptoms. He has actually demonstrated in a number of cases thin adhesions in the subdural space overlying the cerebral hemisphere. Histologically these lesions are composed of a thin layer of blood undergoing the process of organization and adherent to the arachnoid as well as to the dura. When pressure was applied by means of a curved instrument on the under surface of the dura during the course of an operation under

arteriosclerosis, and it is likely that he had antecedent coronary sclerosis, although he had never had the anginal syndrome before.

At the present writing, about nineteen months after the accident, he is still subject to the anginal syndrome.

still is employed by a number of clinicians. The purpose is to have the air 'break up' the subdural adhesions.<sup>10</sup> In a certain percentage of cases in which the disorder is particularly obstinate Penfield advised bilateral trephination with mechanical disruption of the offending membranes.

Brahdy<sup>11</sup> recently presented a series of 6 cases in which he tried the effect of ergotamine tartrate without help.

It may thus readily be seen that there is a definite place for any preparation which can be simply administered and yet relieve the distressing symptoms of this common disorder. Neurosurgical therapy, which has heretofore offered the best means of alleviation of pain, is not always readily available and even if it were, could not be successfully adapted in every case. With these shortcomings in mind, I proceeded to search for a simpler but efficient method. Knowing the vaso-dilating effect of prostigmine and believing that in many of these cases the disorder was on the basis of a disturbed vascular physiologic change, I decided to treat a number of suitable cases with this synthetic autonomic drug. Two of the more typical cases are here-with described, and the summaries of the other cases are presented in outline form in the accompanying table.

In the course of the examination of the patients under discussion the following objective signs were relied on in evaluating the amount of labyrinthine vertigo present in any particular case: (1) spontaneous nystagmus with the patient's head extended backward, to the right and to the left, (2) nystagmus after quick movements of the head, (3) caloric tests,<sup>12</sup> and (4) ophthalmic examination.

#### REPORT OF CASES

**CASE 1**—Peter S. aged 40 first seen on April 20, 1940, gave a history of having sustained a head injury two years before. Although he did not complain of any severe form of headache the dizzy spells which he suffered were often severe enough to necessitate bed rest for two or three days. Potassium iodide and histamine did not alleviate the symptoms, nor did insufflation of the eustachian tubes periodically for one year.

Examination revealed a normal ophthalmic state with clear fundi, normal visual fields and normal extraocular movements. Clockwise rotary nystagmus to the right and counterclockwise rotary to the left were noted as was lateral nystagmus ahead in the three primary positions. The caloric action was much prolonged, with accompanying past pointing to the right. One degree nerve deafness on the right was elicited.

Therapy consisted of 1 cc of solution of prostigmine methylsulfate 1:2000 intramuscularly twice weekly and a 15 mg tablet of prostigmine bromide three times daily by mouth. The following observations were made during the next six months:

- May 1 No bad spells to date
- May 13 No bad spells. Dizziness much less. Nystagmus almost absent. Patient is working again.
- June 3 No nystagmus and very little dizziness.

12 Barany R. Untersuchungen über den vom Vestibularapparat der Ohren reflektorisch ausgelösten rhythmischen Nystagmus und seine Begleiterscheinungen (Ein Beitrag zur Physiologie und Pathologie des Bögenkanalapparates). Berlin C. Coblentz 1906.

June 5 Very dizzy and nystagmus very active. Drank several bottles of beer last night.

June 12 On restricted fluids during past week. Symptoms and signs as of June 5.

July 1 Told to force fluids and return in twenty-four hours.

July 2 Symptoms and signs very prominent again.

August 5 Forced fluids during past twenty-four hours. Symptoms and signs not as bad as on July 2.

October 4 Forced fluids during past twenty-four hours, with only occasional dizziness. Poorly sustained lateral nystagmus to the right.

October 5 No symptoms or signs.

November 25 Forced fluids during past twenty-four hours without any symptoms or signs. Treatment stopped.

**CASE 2**—S. F. a housewife aged 59, sustained a head injury on Jan 31, 1940. Since that time she had suffered from frontal and occipital headaches, photophobia, almost constant dizziness and occasional diplopia especially when looking to the left.

Examination on February 3 revealed blurring of the disk margins and enlarged retinal veins. Spontaneous clockwise rotary nystagmus was noted when the patient looked to the left and counterclockwise to the right both types being present in all primary positions. Caloric tests elicited a prolonged response with past pointing. On February 22, after having been in bed since the time of the accident the patient showed no change in symptomatology. The dizziness was severe enough to enforce complete bed rest.

Therapy consisted of 1 cc of solution of prostigmine methylsulfate 1:2000 intramuscularly twice weekly and a 15 mg tablet of prostigmine bromide three times daily by mouth.

On March 3 she was out of bed and moving about. There was no nystagmus, and the results of caloric tests were normal. Therapy was discontinued.

The patient was seen on September 11 and there had been no recurrence of symptoms.

It is notable that this patient experienced no improvement whatever with twenty-three days of continuous rest in bed. Yet when prostigmine therapy was initiated considerable improvement was noted within one week, and complete recovery occurred in twenty-eight days.

#### COMMENT

The results obtained through the use of prostigmine for the relief of the distressing symptoms of the so-called postconcussional syndrome tend to throw a new light on the etiology of this disorder. It is not intended to discount entirely the evidence accumulated by Penfield and some of the other investigators in this field but rather to contribute additional proof that the syndrome, in part or in some cases at least, has as its etiologic basis an altered vasomotor activity.

Prostigmine is a synthetic autonomic preparation having an action similar to that of physostigmine but lacking many of the disadvantages of the latter drug. Chemically it is the dimethylcarbamate ester of 3-hydroxyphenyl-trimethyl-ammonium methylsulfate or bromide. Its mode of action has not as yet been definitely demonstrated, but it is believed that Ammon's<sup>13</sup> conception is the correct one. This investigator has shown that prostigmine inhibits the action of cholinesterase on acetylcholine, which is liberated at the myoneural junction and which is believed to act as the transmitting agent for the nervous impulse as it passes from the nerve fibers to the effector organ. It would be expected therefore that prostigmine would act as a potentiator of any acetylcholine effects which might occur in vivo. It is a well known fact that acetylcholine is a powerful vasodilator, and, similarly, the administration of prostigmine to the intact organism results in a vasodilat-

ing phenomenon Perlow<sup>14</sup> has found this dilatation to be primarily arterial rather than arteriolar or capillary

It seems not irrational to hypothesize that, in the relief of symptoms due to the postconcussional syndrome, prostigmine acts on the labyrinthine and cranial blood vessels. Many investigators have shown that spasm of a blood vessel is often pain producing, as may be noted by the conception of many that the excruciating pain of angina pectoris is due primarily to a transient spasm of the coronary vessels.

Helfand<sup>15</sup> found in a series of 22 cases of the syndrome that many of the findings were of a functional (reversible) nature and postulated that they were primarily vasomotor in origin. Wolf<sup>16</sup> concluded recently that the best evidence of the cause of intracranial pain at present is that it is an alteration in the tonus of the involved arteries and the meningeal arteries in particular. This fits in very well with the results obtained with prostigmine.

Zacks,<sup>6</sup> as previously mentioned has described degenerative changes in the nuclei of the cochlear and vestibular nerves, as well as an altered irritability of the vasodilators and vasoconstrictors, with resultant areas of localized altered circulation.

It will be noted that in 4 of the cases the forcing of fluids<sup>17</sup> after apparent recovery resulted in a severe exacerbation of symptoms, but as recovery was more complete forcing fluids did not cause recurrence of symptoms. Thus, forcing fluids may be used to determine when recovery is complete.

Dederding<sup>18</sup> observed in cases of Meniere's syndrome that more frequent and severe attacks occurred when there was evidence of retention of body water. He consistently noted improvement when the patients were relatively dehydrated by restriction of the fluid intake and the use of pilocarpine or mercurial diuretics. Furstenberg,<sup>19</sup> working with the same type of patient, concluded that, if ammonium chloride was substituted for sodium chloride, no distressing symptoms arose when the water intake was increased. Thus it is evident that the labyrinth and cranial contents are functionally disturbed by whatever factors lead to a retention of an excess of fluids. It is probable that the improvement of such symptoms afforded through the use of prostigmine is due mainly to the increase of circulatory efficiency allowing the electrolytic balance to return to normal. It is possible that during the process of vasodilatation organic changes, such as adhesions, are mechanically broken up.

In conclusion it seems logical to state that in this series of cases the symptoms were basically of a pathophysiologic nature and, more specifically, organic changes producing an alteration of the involved vasomotor tonus. The value of prostigmine in alleviating and eventually abolishing the symptoms is striking, and it is suggested that this drug be employed in all cases

of the postconcussional syndrome in which the symptoms are distressing enough to require therapeutic intervention. As adjunctive therapy it may be advisable to replace sodium salts with ammonium and to restrict excess fluid intake until the "force fluid" test shows that recovery is complete. If, after a fair trial with prostigmine, there is little or no relief of symptoms, more complicated surgical intervention may be necessary.

## INVOLVEMENT OF THE BRAIN STEM IN THE PRESENCE OF SUB- DURAL HEMATOMA

JACK NELSON, M.D.

NEW YORK

One of the most striking characteristics of subdural hematoma is its capacity for producing complex and variable symptomatology. From the time of its emergence as a disease entity out of the group of pachymeningitis hemorrhagica interna, the effective therapy for this condition has remained essentially unchanged and the problem has been posed as one of diagnosis. Accordingly, the study of subdural hematoma has been concerned largely with the clinical appearance of the disease as a syndrome requiring early and forthright recognition for its successful treatment.

Even from the earliest reports, the impression is gained of the diverse and shifting character of the presenting picture. In the clinical study of Trotter<sup>1</sup> in 1914 the main characteristics of the condition were already described. Trauma, often slight, was considered the invariable cause, a latent interval of hours to days was noted, followed by the prodromal symptoms of headache and generalized retardation. The period of severe symptoms which followed was characterized by a variable state of consciousness and relatively few neurologic signs, chief among them being hemiparesis, occasional swelling of the optic disks, pupillary changes and oculomotor weakness. Trotter concluded that "the variable and apparently capricious clinical course of such chronic hemorrhages, far from rendering the diagnosis exceptionally difficult, constitutes a clinical type at once well marked and characteristic." And he advised early operation with bilateral trephination.

In 1925 Putnam and Cushing<sup>2</sup> reviewed the problem and listed the syndrome as including (a) the general effects of increased intracranial pressure, such as headache, vomiting, somnolence, bradycardia and papilledema, (b) the signs of meningeal irritation such as the positive Kernig sign and neck rigidity, and (c) the evidence of local pressure, such as paralyses, spasticity, aphasia, occasional sensory disturbances and, rarely, convulsions. Mention was made of oculomotor abnormalities, but these were not discussed.

Kaplan in 1931<sup>3</sup> reported 8 cases in which he called attention to the presence of pupillary dilatation on the side of the lesion and indicated its importance as a

lateralizing sign. However this was contrary to the experience of Munro<sup>4</sup> who found no such correlation. Others, including Laudig, Browder and Watson<sup>5</sup> and Voris<sup>6</sup> have studied this problem further with inconclusive results. Gardner<sup>7</sup> emphasized the latent period and adduced evidence in support of the theory of slow osmotic enlargement of the clot. Fleming and Jones<sup>8</sup> recalled attention to the frequent bilateral occurrence of the hematomas and discussed the bearing of this fact on the clinical picture. Significant contributions in other respects were made by Leary,<sup>9</sup> Munro<sup>10</sup> and Kunkel and Dandy.<sup>11</sup> And yet despite these and other advances in the knowledge of subdural hematoma, the presenting syndrome is often so elusive that Carmody in 1941<sup>12</sup> was able to write in substantial agreement with most other authors: 'It is being increasingly recognized that subdural hematoma can simulate almost any brain lesion—and operative exploration is the one way of ruling it out.' And there is evident a tendency toward the more frequent use of trephination in an exploratory manner whenever the presence of subdural hematoma is even suspected.

The present report concerns a group of cases in which the clinical appearance is such that the diagnosis of subdural hematoma is generally not even considered and the patient therefore not given the benefit of operative exploration. There have recently come under our care 6 such cases, in which the clinical symptomatology has simulated indigenous lesions of the brain stem. The failure to recognize the cause resulted in the adoption of a conservative policy with regard to therapy. In 2 cases this terminated in death and the discovery of subdural hematoma on autopsy. In 1 other, after some delay, trephination was performed for ventricular puncture and the hematoma discovered in the course of this procedure. And in the 3 remaining cases the appropriate diagnosis was made only after a delay during which the signs had progressed. In all these cases attention had been directed to the brain stem by the presence of ocular signs which relate to the function of the midbrain and pontine nuclei.

Certain ocular signs which are not attributable to the brain stem are known to occur in subdural hematoma. Putnam<sup>2</sup> remarked on the appearance of pupillary changes, conjugate deviation, ptosis and strabismus and accorded them a diagnostic but no localizing significance. Kaplan's study<sup>3</sup> of pupillary dilatation as a lateralizing sign of subdural hematoma has already been referred to. Jelsma,<sup>13</sup> in an analysis of 42 cases collected from the literature, found disturbance of the ciliary part of the third nerve, extraocular muscle weakness or simple abducens paralysis in more than one fourth of the cases. A review of 48 cases in the neuro-

logic service from 1932 to 1940 revealed (in the order of incidence) anisocoria, impaired pupillary reaction, ptosis and paralytic strabismus, with ocular palsies not uncommon. With the exception of pupillary changes (the causation of which is not clear in this connection) all these signs may be ascribed to involvement of the third, fourth or sixth cranial nerves in their peripheral course along the base of the skull—presumably by pressure or traction.

However, in the group of cases of subdural hematoma under present discussion, the oculomotor signs were paralysis of gaze and of convergence, nystagmus and even, at times, disorganization of gaze.<sup>14</sup> These signs cannot be satisfactorily explained by involvement of the nerves in their peripheral course at the base of the brain. They represent damage to the brain stem proper and are referable to impairment of function of the oculomotor nuclei, the region of the quadrigeminal plate, the abducens nuclei, the para-abducens region and the posterior longitudinal bundles—all being structures within the substance of the midbrain and pons. It was as a consequence of this symptomatology that the observers chose a conservative course rather than the surgical procedure so urgently required.

A survey of the literature of subdural hematoma reveals the sporadic occurrence of similar cases with signs of brain stem disease.<sup>15</sup> Though in individual instances these have been striking, attention has never previously been directed to them as a group. One case, which was carefully studied by Lord,<sup>16</sup> is deserving of special mention in that it exemplifies our problem most clearly.

A man aged 43 entered the hospital with the complaint of occipital headaches for the previous six weeks together with weakness, unsteadiness, somnolence and occasional nausea. There was no history of trauma.

The patient was poorly attentive. The cranial nerves were normal. The neck was stiff. There were slight right finger to nose ataxia and the suggestion of a Romberg sign.

Under observation the left pupil became widely dilated, and it reacted sluggishly to light. Subsequently there appeared paralysis of upward gaze with weakness of convergence. The right lower extremity showed increased knee jerk and Babinski and Gordon signs. The spinal fluid was tinged with blood and was xanthochromic. The findings were assigned mainly to lesions of the left cerebral peduncle and the quadrigeminal plate and the diagnosis was made of hemorrhage (or tumor with hemorrhage) into the midbrain.

Surgical intervention was not advised. The course was downhill to death on the nineteenth hospital day. Autopsy revealed bilateral frontoparietal subdural hematomas, and careful section of the midbrain showed no pathologic changes.

#### REPORT OF CASES

Six cases which have come under our own observation are now described.

**CASE 1—History.**—M. C., a woman aged 50, was admitted on March 4, 1940 in a somnolent condition with a complaint of intermittent drowsiness of one week's duration. She was

14 The phrase disorganization of gaze as used by the neurologic examiners who observed these cases was intended to denote the dissociation of conjugate movement in such fashion that the harmony normally obtaining between the two eyes is disturbed though there is no individual muscle weakness. One type of such dissociation of gaze has been described by L. Hermitte under the title ophthalmoplegia internuclearis anterior and attributed to lesions of the internuclear pathway of the posterior longitudinal bundle.

a known alcoholic addict, and it was subsequently learned (in the course of investigation at the conclusion of the case) that she had been struck on the head in the course of an argument one week before.

*Physical Examination*—The patient was obese, somnolent and moderately dehydrated. Her temperature and respirations were normal, but the pulse rate was 62 and the blood pressure 180 systolic and 110 diastolic. There was no evidence of trauma of the head or stiffness of the neck. The right pupil was greater than the left, both reacted sluggishly to light. Both horizontal and vertical nystagmus were present. There was slight right facial weakness of central type, with weakness of the right arm and both legs. The reflexes were overactive, more so on the right, with bilateral Babinski signs. The remainder of the examination disclosed a hard nodule in the thyroid, some medium moist rales at the left base and a heart of normal size, with forceful sounds and a systolic murmur at the base, with the aortic second sound louder than the pulmonic.

A lumbar puncture revealed xanthochromic fluid with initial pressure of 70 mm of water. Other findings were normal in the spinal fluid, blood and urine.

*Course*—The following day the patient was seen by the neurologic consultant, who found her drowsy but still able to give her name and fairly cooperative. The pupils were dilated and fixed to light, there was ptosis of the right upper lid. Paralysis of right lateral and upward gaze were present (and there was mention of paralysis of the right abductor at the same time). The weakness and spasticity of the limbs and bilateral hyperreflexia, more on the right, were as noted previously, and, in addition, deep sensation was impaired on the right. There were no sucking or grasping reflexes present.

The diagnosis of pontine and midbrain hemorrhage was made. The course was steadily downhill, and the patient died on the fourth hospital day.

*Autopsy*—There were moderate left ventricular hypertrophy and sclerosis of the aorta. The lungs showed confluent lobular pneumonia, and examination of the liver disclosed some degree of fatty change. The main findings related to the head. The scalp showed no evidence of injury. Removal of the calvarium disclosed a subdural hemorrhage which appeared in the form of a blood clot limited to the right side of the vault and base of the skull. The blood clot when removed weighed 70 Gm, and there was some adherence of the clot to the dura on the vault of the skull. At the base of the skull there was also a slight subdural hemorrhage in the anterior fossa on the left side. On the surface of the brain, over the right parietal lobe and near the longitudinal fissure, there was visible a ruptured pial vein from which a small clot protruded conspicuously. The brain showed considerable molding of the right cerebral hemisphere and flattening of the left hemisphere. On section, the brain, including the midbrain and pons, showed no lesions on careful gross inspection.

This patient presented outstandingly horizontal and vertical nystagmus, followed by the appearance of dilatation, with fixation of both pupils, ptosis of the right lid and paralysis of upward and of right lateral gaze. There were further, bilateral pyramidal signs, more on the right, and impairment of deep sensation of that side. Ptosis of the lid is, as has been noted, commonly found in cases of subdural hematoma and has been attributed to pressure or traction on components of the third cranial nerve. However, the presence of pupillary dilatation and gaze paralyzes directed attention to the midbrain and pons leading, in this case, to a diagnosis of midbrain hemorrhage with consequent conservatism in therapy. On autopsy the patient was found to have a subdural hematoma with no lesion in the brain stem on careful gross inspection.

*CASE 2—History*—M L, a white man aged 54, was admitted to the neurologic service on July 11, 1940 with the complaint of occipitoparietal headaches for nine weeks, becoming progressively worse. More recently there had been dizziness, with nausea, transient amnesia and drowsiness. In the few days before entry the family had remarked that the patient was at times disoriented and confused. There was no past history of alcoholism, but the patient had suffered a moderate blow on the head about three weeks before the onset of symptoms.

*Physical Examination*—The patient was drowsy, with incessant yawning and dozing. Though responding to simple commands, he was disoriented for time, place and person, and there were gross recent memory defects and compensatory confabulation. His blood pressure was 150 systolic and 100 diastolic and his pulse rate was 76. There was no external evidence of injury. The fundi were normal. The pupils were small and irregular and reacted to light and near fixation. Gaze was normal, and there was no nystagmus. Other cranial nerves were normal. There was moderate hypertonus, more on the left, with bilaterally equivocal plantar reflexes. Sensation was intact within testable limits. The provisional diagnosis was of an expanding intracranial lesion but with no localization possible.

On lumbar puncture the spinal fluid was bloody because of the traumatic insertion of the needle but was not otherwise abnormal. The serologic reactions were negative.

*Course*—Under observation the patient became more stuporous, though with intermittent periods of alertness. On the third day there appeared a left lower facial paresis, pyramidal signs on the left and ocular signs, consisting in bilateral lid ptosis, definite isolated paralysis of the left internal rectus and weakness of the left external rectus movements, without gaze paresis or nystagmus. The impression was that of a rapidly developing midbrain and pontine lesion, though subdural hematoma was considered. Ventriculography was advised.

On the fifth hospital day, bilateral trephines were made over the occipital regions. An old dark subdural hematoma was found on the right, and 75 cc of dark red blood with clot was evacuated. There was immediate improvement and, though the postoperative course was unsettled, with recurrent stupor, occasional disorientation and persistent diplopia, this improvement continued. On the thirteenth postoperative day there was still present isolated paralysis of the left internal rectus. On the thirty-seventh postoperative day the patient was discharged with residual diplopia and occasional headaches but otherwise well. On reexamination some months later there was moderate paresis of movement of the left internal rectus but no other abnormality.

This patient presented the general signs of drowsiness, disorientation and confusion together with left sided pyramidal signs and bilateral lid ptosis. The associated paralysis of the left internal rectus movement was considered a manifestation of involvement of the oculomotor nucleus—part of a brain stem lesion. Trephination, however, revealed a subdural hematoma and after its removal there was incomplete but progressive clearing of the signs. The appearance of paralysis of the left internal rectus long after the initial injury and during the period of expansion of the hematoma indicates that the midbrain lesion resulted from pressure transmitted from above. Apparently this pressure was great enough to cause actual damage in the oculomotor nucleus—anatomic damage which was not completely reversible.

*CASE 3—History*—H F, a white man aged 40, unmarried, was admitted to the neurologic service on July 24, 1940 with a complaint of increasing weakness. The patient was a chronic alcoholic addict with epileptic seizures occurring 2 or 3

since the age of 18 years. More recently the seizures had become more frequent and more severe following drinking. In the three years before the present entry there had been four hospital admissions for postalcoholic convulsions and on two of these occasions there had been evidence of fractured skull. On the last of these previous admissions in March 1940 there had been noted essentially a right pupil slightly larger than the left, a suggestive left central facial weakness and left sided pyramidal signs. The possibility of subdural hematoma was then entertained but the patient refused treatment and left the hospital. Since that time, however, the left arm and leg showed increasing weakness accompanied by drooping of the left eyelid together with right frontal headaches.

*Physical Examination*—The patient was somnolent but easily roused and quite cooperative. His pulse rate was 60 and his blood pressure 125 systolic and 80 diastolic. There was an old scar with deformity over the occiput. The fundi showed slight blurring of the disks more on the left. There was some ptosis of the left lid, the pupils reacted poorly to light and the left pupil was smaller than the right. Ocular movements were outstandingly impaired with almost complete paralysis of upward gaze and vertical nystagmus on the attempt and there were definite weakness of downward gaze and absence of convergence. There was some weakness of right eye adduction but other movements were normal and no disorganization of gaze was noted. There were further left lower facial weakness, paresis of the left arm and leg and bilaterally overactive reflexes, with impaired abdominal and bilateral Babinski reflexes. Sensation was intact.

Lumbar puncture revealed initial pressure of 180 mm of water with entirely normal spinal fluid and negative serologic reactions.

*Course*—The impression was of subdural hematoma. During the night the patient became more stuporous and the following morning bilateral temporal trephines were made. On the right the dura was normal. On the left was found a chronic subdural hematoma under pressure and 100 cc of dark clotted blood was evacuated. The response was immediate and dramatic with clearing of the sensorium and remission of the physical signs. Five hours postoperatively, but for a residual anisocoria the ocular signs had cleared completely. After an uneventful convalescence the patient was discharged improved on the twenty-seventh postoperative day.

In this case the previous history, the course of the illness and the physical signs all supported the finding of subdural hematoma. The ptosis and anisocoria are, of course, often found in such cases. The remaining ocular signs, however, were considered most unusual for this condition. The almost complete paralysis of the upward gaze, with vertical nystagmus, the weakness of the downward gaze and the failure of convergence all indicate involvement of the midbrain proper in the region of the oculomotor nuclei and the quadrigeminal plate. Though the precise cause of this involvement is not clear the almost immediate disappearance of the oculomotor signs postoperatively stands against an intrinsic lesion of the brain stem and favors an effect from the hematoma itself—presumably transmitted pressure.

*CASE 4*—J. T., a man aged 46, white, married, a brick layer, was admitted to the neurologic service on Dec. 9, 1939, with increasing stupor. Three days before entry he had been found semiconscious in the street but without evidence of injury at that time. He was taken home and while under home care showed persistent stupor, incontinence, right sided weakness and inability to speak clearly.

*Physical Examination*—The patient though conscious was lethargic and inattentive and did not respond to questions. There were pitting edema over the scalp, with depression at the

vertex, and several old scars supraorbitally and over the occiput. The pupils were irregular but equal and reactive. The patient could not converge. There was ptosis of the left lid, but no other ocular abnormalities were noted. Right facial weakness of central type was present as were paralysis of the right arm and to a lesser degree of the leg. Further, the right abdominal reflex was easily exhaustible, and there was a right Babinski sign.

A lumbar puncture revealed an initial pressure of 240 mm of water. The fluid was pinkish, with 4,200 red blood cells per cubic millimeter and 40 mg of protein per hundred cubic centimeters. A Pandy test and serologic tests were negative.

*Course*—Roentgen examination showed a lineostellate fracture at the vertex without evidence of depression. The impression at this time was of craniocerebral injury with cerebral laceration. The patient was kept under observation. On the following day he became more responsive, answering questions and being able to move the right arm. At this time, however, there appeared ptosis of the left upper lid (previously noted), double external rectus weakness, failure of convergence and disorganization of both horizontal and vertical gaze (one observer noted in addition weakness of lateral gaze to the right). The impression was of contrecoup hemorrhages of the brain stem and a conservative policy was advised. Under further observation for ten days the patient continued to be intermittently disoriented but on the whole improved.

However, on the twelfth day after entry there were a recurrence of stupor and an increase in right sided paresis. A diagnosis of subdural hematoma was then entertained, and bilateral frontoparietal trephines were made. On the left, a large subdural hematoma was found from which was evacuated 200 cc of brownish liquid and clotted blood. There was immediate return of consciousness. The postoperative course except for intermittent stupor showed steady improvement with clearing of the pyramidal and ocular signs in about one week. The patient was discharged well on the twenty-third postoperative day.

While this patient was under observation for fractured skull and right sided pyramidal signs, there appeared ocular signs which indicated involvement of the midbrain and pons and dictated conservatism in approach. Subsequent recurrence of stupor and right sided paresis led to trephination and the finding of left subdural hematoma, the removal of which was followed by the rapid clearing of all signs.

*CASE 5—History*—M. D., a woman aged 49, a housewife, was admitted to the psychiatric division of Bellevue Hospital with the complaint of increasing weakness of the left side. The patient was a known chronic alcoholic addict who gave a vague history of having bumped her head about a week before entry. This was followed by headaches, intermittent disorientation (according to the daughter) and left sided convulsive seizures on successive days.

*Physical Examination*—The patient was apathetic, moderately confused and disoriented and in a postalcoholic state. Her blood pressure was 100 systolic and 70 diastolic and her pulse rate 100. Tenderness of the skull with contusions over the right frontal area was observed. The optic disks were normal. There was an incomplete left homonymous hemianopia to gross testing. The left pupil was greater than the right both reacting sluggishly to light. The eyes tended to turn to the right with nystagmus in that direction. There were further, left lower facial weakness, hemiparesis on the left (increasing to hemiplegia after her left sided seizures) and a left hemianesthesia.

Lumbar puncture showed initial pressure of 220 mm of water. The fluid was faintly xanthochromic. The Pandy test was suggestively positive. A few red blood cells and white blood cells were noted.

*Course*—Under observation the patient had an irregular course. The following day there were noted, in addition to the left sided pyramidal signs previously found, a paresis of left lateral gaze, with nystagmus on gazing to the right. And two days later there appeared increased drowsiness, complete paralysis of left lateral gaze and much impairment of upward gaze. The impression at this time was of midbrain and pontine involvement in addition to hemorrhage in the right cerebral hemisphere. Conservative measures were advised.

However, the pulse rate fell to 70, the patient became more drowsy, the left sided paresis progressed to hemiplegia and there was nystagmus in all directions. The diagnosis of subdural hematoma was entertained, and on the fourth hospital day bilateral parietal trephines were made. On the right was found a large subdural hematoma containing dark red liquid and clotted blood. The postoperative course showed steady improvement, the ocular signs cleared completely, but the hemiparesis and hemihypesthesia remained in some degree. On the twenty-ninth postoperative day the patient was discharged as improved.

*Readmission*—Approximately three months later the patient was readmitted to the hospital with a persistence of jacksonian seizures. At this time there were found a spastic left hemiparesis, together with left sided impairment of superficial and deep sensation, including vibration and stereognosis. There were, however, no ocular abnormalities. Encephalography revealed definite dilatation of the right ventricle. The diagnosis was of gliosis and atrophy following the initial cerebral injury. The patient was discharged and given phenobarbital therapy.

*Comment*—This patient gave evidence of lesions in the right cerebral hemisphere. The ocular signs were anisocoria and deviation of gaze to the right. While under observation, there appeared paralysis of left lateral gaze and impairment of upward gaze, which signs led to the diagnosis of midbrain and pontine hemorrhage in addition to the lesions in the right cerebral hemisphere. Subsequently, after the progression of signs, trephination was done, and there was disclosed a right subdural hematoma. After its evacuation the oculomotor abnormalities disappeared, though the right cerebral hemisphere remained irreversibly damaged.

*CASE 6—History*—J. T., a Negro aged 28, was admitted to Bellevue Hospital, psychiatric division, in an intoxicated condition and unable to give any history.

*Physical Examination*—The patient was stuporous and uncommunicative. There was no evidence of injury about the head. The pupils were equal and reactive to light and convergence. The other cranial nerves were normal. There were, further, bilaterally overactive reflexes with absent abdominal but normal plantar reflexes.

Lumbar puncture showed normal pressure. The fluid was crystal clear and colorless.

*Course*—The patient remained dull and somewhat confused with increasing restlessness and incontinence and, on the fourth day, increasing diffuse headache. At this time the pupils were miotic and fixed to light, and there was impairment of convergence and upward gaze but no nystagmus. There were, further, bilateral pyramidal signs, more on the left, with questionable hemihypesthesia on that side. The right upper extremity displayed a rhythmic tremor described as parkinsonian. The patient was transferred to the neurologic service.

During the following days the pupils became dilated and fixed to light, with disorganization of gaze and a tendency toward bilateral ptosis. The impression was that of alcoholic polioencephalitis superior. The patient became drowsier, passed into a coma and died on the eighth hospital day.

*Autopsy* (confined to the head)—There was hemorrhage in the temporal muscle. The calvarium was normal and without fracture, as was the base. On removal of the dura, a large

subdural hematoma was found over the left cerebral hemisphere covering the vertex and also extending into the base. This hemorrhage was about 6 ounces (180 cc) in amount and was composed of dark reddish brown clotted blood. No membrane formation was seen. The convolutions over the left hemisphere were molded, but there was no lesion of the brain tissue. Over one of the convolutions in the posterior part of the frontal lobe, just anterior to the junction between the Rolandic and Sylvian fissures, was a small, torn pial vein. Convolutions of the right hemisphere showed distinct flattening, with obliteration of the sulci, and there was considerable flattening at the base of the brain. The basal ganglions were intact, and the midbrain, pons and cerebellum were normal on careful gross inspection. The vessels at the base were normal.

This patient presented the following ocular signs: miotic and fixed pupils, which then became dilated and fixed, and impairment of convergence and of upward gaze, followed by dissociation of gaze. Further there were bilateral pyramidal signs more on the left, a parkinsonian tremor of the left arm and suggestive left hemihypesthesia. Under observation the patient had a downhill course and died. On autopsy, a subdural hematoma was found, but the brain stem was entirely normal except for flattening.

#### GENERAL COMMENT

The pathogenesis in general of those ocular signs in subdural hematoma which are referable to lesions of the brain stem is probably manifold, with differing mechanisms coming into play in different cases. Not infrequently a subdural hemorrhage in the usual location is accompanied by hemorrhage elsewhere. Even a brief review of autopsy material in the cases of subdural hematoma (other than those just described) from the Bellevue neurologic service has disclosed the occurrence of contrecoup lesions with associated hemorrhage around the cerebellum or within the brain stem. Though these occur most commonly in the more acute injuries, their appearance with chronic subdural hematomas is not unknown. In one case of long duration autopsy revealed, besides a left subdural clot, hemorrhage within the fourth ventricle and under the surface of the cerebellum. In this patient the ocular signs were pinpoint size pupils which were fixed to light and right internal and left external rectus paresis.

In other cases a subdural hematoma in the usual parasagittal or parietal location, being large, extends down under the brain into the basilar fossae and may reach to the brain stem. In yet other instances the hematoma may itself occur in an unusual place. Hematomas have been reported by Dandy<sup>17</sup> over the lateral surface of the temporal lobe and also under that lobe in the middle fossa. The same author has found the lesion also at the sella turcica. The subtentorial location of subdural clots in relation to the cerebellar hemispheres has been described by a number of authors, among them Munro,<sup>18</sup> Peet<sup>19</sup> and Schreiber.<sup>20</sup> Aring and Evans,<sup>20</sup> in their report on this type of lesion, summarized the findings of others and added a case in which there was a clot in the superior longitudinal

fissure between the cerebral hemispheres. In certain cases therefore, subdural hematoma either by virtue of its own aberrant location or through associated brain stem or basilar hemorrhage can cause the signs of brain stem disease.

*Notes on Pathogenesis*—However, in the cases under present discussion none of these mechanisms could have been operative. Rather, there must have been transmission of pressure from the expanding supratentorial lesion to structures at the base of the brain. In cases 1 and 6 the 2 cases in which autopsy was performed the brain stem revealed no lesions beyond the flattening already noted. In case 3 the ocular signs cleared almost immediately after operation thereby indicating that there was no intrinsic brain stem damage but rather a disturbance of function caused by pressure from above and relieved with the removal of that pressure. In the remaining cases, 2, 4 and 5 the signs of brain stem involvement appeared several days to weeks after the initial injury and during the period in which the signs of an expanding intracranial mass were increasing. After operation in these cases the ocular signs cleared slowly over a period of weeks to months in 1 patient with residual defect. Here one may postulate that transmitted pressure was sufficiently severe or of such duration as to bring about secondary hemorrhage into or softening of brain stem structures. That such secondary hemorrhage can occur into the midbrain as a result of extrinsic pressure has been showed by Van Gehuchten<sup>21</sup> and by Moore and Stern.<sup>22</sup>

The precise mode of the transmission of pressure from the supratentorial space to the brain stem is possibly through the formation of a temporal pressure cone.<sup>23</sup> Unfortunately in the 2 cases in this group which came to autopsy, the question was not specifically considered at the postmortem examination, and therefore judgment on this point cannot be made. Nevertheless, this mechanism offers a plausible explanation for the findings and merits consideration. Schwarz and Rosner<sup>24</sup> in a recent thorough study of the subject have found the herniation of the hippocampal gyrus through the incisura of the tentorium to occur in 83 per cent of the patients with expanding supratentorial lesions coming to autopsy. The tumors, in their cases occurred at almost any point over the cerebral hemispheres, with perhaps a predilection for the areas surrounding the sylvian fissure. That subdural hematoma in its character of an expanding lesion, is at times a cause of such tentorial herniation has been recognized. In 1 case in the series of Schwarz and Rosner there was a subdural hematoma and Aring and Evans, in their article to which I have already referred described 2 others. In a report of some years previously, Spatz and Stroescu<sup>25</sup> described a case in which bilateral subdural hematoma was the cause of herniation through the tentorium and

they showed how such herniation could press on the diencephalon and brain stem.

The clinical picture of the temporal pressure cone has been studied by a number of authors.<sup>26</sup> Jefferson in 1938<sup>27</sup> emphasized the secondary effects of tentorial herniation in its production of pressure on the midbrain and described cases in which the clinical picture featured fixation and dilatation of the pupils together with decerebrate states. Schwarz and Rosner, in their study previously referred to found disturbance of oculomotor function among the most prevalent of all signs of tentorial herniation and they mentioned 4 cases in which there was limitation of upward gaze. There is little doubt then that herniation of the medial part of the temporal lobe through the tentorium may be caused by subdural hematoma and that such herniation may press on the brain stem, causing functional impairment or structural damage according to the severity of the pressure. Though there is no proof that this mechanism was operative in the cases described, I advance it as a hypothesis requiring further study and confirmation.

*Clinical Syndrome*—It will be recalled that the diagnoses originally entertained in some of these cases were of lesions of the midbrain of one type or another. Wernicke's alcoholic psoencephalitis superior was diagnosed in 2 cases, tumor in another and hemorrhage into the brain stem—due either to hypertension or to contrecoup injury—in the rest. It would be interesting to see whether these cases present a consistent and recognizable clinical picture in such fashion that the true diagnosis might have been made more frequently and in time to permit more effective surgical treatment.

In all but 1 of the cases there was a history of trauma of the head and in most of the patients (including the one from whom no history of injury was obtainable) there was a background of alcoholism. The duration of the symptoms was from two to four months in 2 of these cases and from days to weeks in the others, this is in contrast to the much slower course of tumors of the brain stem, which generally develop over a period of months or years. On the other hand, the onset of signs in these cases was slower and more insidious than in cases of hemorrhage, the symptoms of which occur dramatically and, in the case of contrecoup damage to the brain stem, might be expected to date from the time of the initial injury. Furthermore, though the clinical picture was on the whole progressive, in most of these cases there was a fluctuating course with regard both to the state of consciousness and to the ocular signs themselves. Although a patient with tumor of the brain stem may show shifting states of consciousness, a pronounced fluctuation of signs is rather characteristic of subdural hematoma as against the more steady progression that is usually associated with tumor.

Finally the distribution and degree of the brain stem signs deserve notice. In indigenous disease of the brain stem the local signs might be expected to be outstanding, and they are often found to involve chiefly the

hindbrain or else the entire brain stem in scattered fashion bilaterally. In these cases the signs were generally slight or moderate compared with the rest of the picture, and they related chiefly to the midbrain without evidence of involvement of the cranial nerve nuclei below the abducens.

Alcoholic polyencephalitis superior may be distinguished from these cases by its character as a deficiency disease—the alcoholism is outstanding, and there are signs of general malnutrition. Changes in the skin and mucous membranes bear witness to lack of specific vitamins. The mental picture is characterized by restlessness or somnolence and often with disorientation. Lastly, apart from the oculomotor disorders and ataxia, localizing neurologic signs are not prominent.

To summarize, the condition in the cases reported was characterized by a history of trauma of the head, a background of alcoholism (predisposing to trauma of the head), the development of signs over a period of days to a few months and a variable and fluctuating course. All together, these features go to make up a clinical picture consistent with subdural hematoma and certainly warranting the suspicion of that condition. And, when that diagnosis is even suspected, the presence of signs of disease of the brain stem should not be considered to contraindicate exploratory trephination.

*Notes on Paralysis of Gaze*—A word of caution is in order with regard to the diagnostic significance of oculomotor signs. It is not sufficiently recognized that these signs are not entirely specific and that impairment is sometimes manifest as the result of generalized depression of the sensorium. Kestenbaum<sup>28</sup> has pointed out that any gaze movement involves various levels of activity. Hence in stupor there often occur nonspecific disturbances of these functions. Upward gaze is the first to suffer, followed by convergence, and in deep coma no gaze movements whatever may be elicited. In the review, already referred to, of 48 cases in the Bellevue neurologic service between 1932 and 1940, there was a fairly high incidence of all kinds of oculomotor disturbances in stuporous and semicomatose patients, and a similar incidence obtains with respect to a number of published series. I have tried to select only those cases in which the level of cooperation was such as to warrant the analysis of eye movements.

CONCLUSIONS

In cases of chronic subdural hematoma there occasionally appear signs referable to disease of the brain stem. Because radically different approaches to therapy depend on the appropriate diagnosis in such cases, and particularly because timely surgical intervention is of such dramatic benefit in subdural hematoma, it is important that this fact be kept in mind and that indications for exploratory operation be considered accordingly.

When the other clinical findings warrant the suspicion of subdural hematoma, the presence of signs of involvement of the brain stem should not stand in the way of operative exploration.

99 St. Marks Place

INCIDENCE OF LEAD POISONING IN THE CITY OF BALTIMORE

JOHN M. McDONALD, M.D., D.P.H.  
Director, Bureau of Occupational Diseases, Baltimore City Health Department

AND  
EMANUEL KAPLAN, Sc.D.  
Chief, Division of Chemistry, Bureau of Laboratories, Baltimore City Health Department  
BALTIMORE

Since 1935 the Bureau of Laboratories of the Baltimore City Health Department has provided a routine laboratory service for the quantitative estimation of lead in blood and other body fluids as an index of abnormal lead absorption in cases of suspected lead poisoning.<sup>1</sup> The cooperation of those physicians and hospitals who made use of this service was solicited in order to make available the clinical histories of the persons whose bloods were examined for lead. In this way considerable information was obtained about the local occurrence of both industrial and nonindustrial lead poisoning.

A summary of the incidence of lead poisoning in the city of Baltimore during the period 1931-1940 is shown in table 1. These data were obtained from the follow-

TABLE 1—Lead Poisoning in Baltimore, 1931-1940

| Year  | Total Cases | Fatal Cases |       | Nonfatal Cases |       |
|-------|-------------|-------------|-------|----------------|-------|
|       |             | Adult       | Child | Adult          | Child |
| Total | 228         | 7           | 49    | 86             | 86    |
| 1931  | 3           | 1           | 2     |                |       |
| 1932  | 51          |             | 2     | 12             | 37    |
| 1933  | 5           | 1           | 2     | 2              |       |
| 1934  | 10          |             | 6     |                | 4     |
| 1935  | 22          |             | 10    | 5              | 7     |
| 1936  | 35          | 1           | 8     | 10             | 11    |
| 1937  | 26          |             | 2     | 16             | 8     |
| 1938  | 19          | 2           | 6     | 4              | 7     |
| 1939  | 23          | 1           | 4     | 11             | 1     |
| 1940  | 34          | 1           | 7     | 21             | 5     |

ing sources: (1) reports of occupational lead poisoning, (2) reports of deaths from lead poisoning and (3) cases ascertained in a follow-up of the blood lead laboratory service.

All the fatal cases were reported to the Bureau of Vital Statistics. However, there is little tendency to report nonfatal lead poisoning. Lead poisoning in children is not a reportable disease in Maryland. Since 1934 at least 117 cases of nonfatal lead poisoning have occurred in all ages, yet 89 per cent of these cases were ascertained only as a result of a follow-up study of the blood lead laboratory service. The table includes 40 cases of nonfatal lead poisoning which occurred in 1932 as a result of the use of discarded storage battery casings for fuel.<sup>2</sup> Fatal lead poisoning was a far more frequent happening in children than in adults. Eighty-six per cent of the deaths recorded in table 1 were those of children, the primary cause of death in practically all being either lead poisoning or lead encephalitis. On the other hand, in 5 of the 7 adult deaths lead poisoning was reported merely as a contributory cause.

The high frequency of fatal lead poisoning in children reported from Baltimore as compared with other areas

The population of the city of Baltimore is about 47 per cent of the total population of the state of Maryland.

838,700), which constitutes only 0.65 per cent of the population of the United States registration area. Based on cases reported in children during the ten year period 1931-1940, the death rate from lead poisoning in Baltimore would seem to have been about fifty times as high as in the remainder of the general population of the United States. That this situation was not generally appreciated is evident from the following statement which appeared in a statistical report<sup>3</sup> on lead poisoning:

A tabulation of deaths from lead poisoning in eighteen American cities in which lead-using industries are more or less concentrated gives the following results. In the aggregate there were 179 deaths during the period 1929-36 of which 30 occurred in New York City, 29 in Baltimore, 28 in Philadelphia, 22 in Boston, 16 in Chicago, 15 in Cleveland and 10 in Providence.

This statement implied that the relatively large number of deaths from lead poisoning in Baltimore had occurred as a result of industrial exposures. However, the implication was not in accordance with the known

TABLE 3—Lead Poisoning in Children in Baltimore 1931-1940

| Age Years | Total | White |        | Colored |        |
|-----------|-------|-------|--------|---------|--------|
|           |       | Male  | Female | Male    | Female |
| Total     | 135   | 25    | 19     | 46      | 40     |
| Under 1   | 1     | 6     | 7      | 1       | 5      |
| 1         | 26    | 15    | 7      | 10      | 13     |
| 2         | 45    | 3     | 1      | 2       | 4      |
| 3         | 13    | 1     | 1      | 15      | 10     |
| 4         | 10    | 1     | 1      | 6       | 7      |
| 5-9       | 27    |       |        |         |        |
| 10-14     | 13    |       |        |         |        |

facts. Actually 36 cases of fatal lead poisoning were reported in Baltimore during the period 1929-1936. Only 4 of these deaths occurred in adults. On the other hand 32 deaths or 89 per cent of the total, were due to nonindustrial lead poisoning, that is to say, they were deaths of children mostly resulting from the chewing of objects painted with lead-containing paint.

3 Hoffman F. L. Lead Poisoning in 1936 and in Earlier Years. Monthly Labor Review. Bureau of Labor Statistics. U. S. Department of Labor. February 1938. Serial No. R 669.

These facts again demonstrate the general lack of adequate statistical information on mortality and morbidity from lead poisoning, a condition which has been repeatedly mentioned in the literature.<sup>4</sup>

During the period 1931-1940 a total of 135 cases of lead poisoning occurred in children in Baltimore City. The age, sex, and color distribution of these children is shown in table 3, which includes both fatal and non-fatal cases. The average age in this group is 4 years. However, the group includes 37 colored children of an average age of 7½ years who were concerned in the 1932 outbreak of lead poisoning associated with the use of storage battery casings for fuel.<sup>2</sup> The average age of the remaining 99 children is 2½ years. Practically all had a history of pica associated with the chewing of objects painted with lead-containing paints. The age specific morbidity rate for lead poisoning during the ten years 1931-1940 based on this group of 99 children is more than five times as high among the colored population (137 per hundred thousand) as it is among the white population (25 per hundred thousand). The colored group constitutes approximately 19 per cent of the total population.

During the same time 93 cases of lead poisoning occurred among adults. Colored persons were involved

TABLE 4—Occupational Distribution of Persons with Lead Poisoning in Baltimore 1931-1940

| Occupation                | Number of Cases |       |         |
|---------------------------|-----------------|-------|---------|
|                           | Total           | White | Colored |
| Total                     | 228             | 123   | 105     |
| Painter                   | 24              | 22    | 2       |
| Lead arsenate worker      | 13              | 13    |         |
| Acetylene burner          | 12              | 11    | 1       |
| Enamel worker             | 10              | 10    |         |
| Paint maker               | 8               | 5     | 3       |
| Gasoline tank cleaner     | 8               | 8     |         |
| Junk metal worker         | 5               | 1     | 4       |
| Solder grinder            | 3               | 3     |         |
| Printer                   | 1               | 1     |         |
| Miscellaneous occupations | 5               | 4     | 1       |
| Nonoccupational adult     | 4               | 1     | 3       |
| Nonoccupational children  | 135             | 44    | 91      |

in 14 of these cases. The age specific morbidity rate among colored adults over the ten year period (12 per hundred thousand) is less than the rate among the white persons (16 per hundred thousand). For the five years 1936-1941, which reflect the increase in our knowledge of the occurrence of lead poisoning (table 1), the corresponding morbidity rates in adults are somewhat higher (15 per hundred thousand in the colored group and 25 per hundred thousand in the white group).

An occupational distribution of persons with lead poisoning is shown in table 4. The largest single group includes painters. It must be pointed out, however, that a number of painters in this series had relatively mild lead intoxication. Nine of the 13 lead arsenate workers were white women employed in packing operations. One of the enamel workers was a white woman engaged in spraying enamel frit. There were no other cases of lead poisoning of occupational origin among women. The junk metal workers operated furnaces for reclaiming scrap lead in junk yards. The acetylene burners employed torches in shipbreaking. The printer

spent a portion of his daily time remelting type and skimming and sifting dross from the remelt pot. The list includes one nonoccupational case, that of an adult who was given lead and opium pills in the treatment of tuberculous enteritis.<sup>5</sup>

#### SUMMARY

1 Largely as a result of studies associated with a follow-up of a blood lead laboratory service, it has been possible for the Baltimore City Health Department to acquire relatively accurate information concerning the incidence of lead poisoning in the community in recent years.

2 In the ten year period 1931-1940 at least 228 cases of lead poisoning are known to have occurred in Baltimore. Of these, 93 cases, or 41 per cent, involved adults, and 135 cases, or 59 per cent, occurred in children. There were 7 fatalities among the adults, as compared with 49 fatalities among the children.

3 Lead poisoning was of more frequent occurrence among colored children than among white children. Adult lead poisoning of occupational origin was more common among the white population than among the colored.

## ECLAMPSIA AT THE UNIVERSITY HOSPITAL

1926 TO 1941

E. D. PLASS, M.D.  
IOWA CITY

During the sixteen years between Jan. 1, 1926 and Dec. 31, 1941, 80 eclamptic patients were observed and treated at the University Hospital. Thirty-seven women were admitted in the convulsive stage, and 43 suffered the seizures after admission, all but 13 of the latter were admitted because of toxemia. Throughout the series, eclampsia was viewed as a medical condition and treatment followed a fairly consistent pattern. This communication deals with the results obtained and involves a discussion of the lessons learned by the experience.

#### TREATMENT EMPLOYED

The essence of therapy revolves around the clinical observation that eclamptics generally do not have convulsions when the respirations are less than 14 to 16 per minute and the deduction therefrom that there is some relationship between the respiratory exchange and the appearance of the convulsive episodes. Heavy sedation was therefore employed, and the dosage was regulated solely by the effect on the respiratory rate, which was reduced to 12 per minute as quickly as possible. The most commonly employed drug was morphine, which was administered in all but 6 very mild cases in amounts varying from  $\frac{1}{4}$  grain (0.016 Gm.) to  $\frac{6}{16}$  grains (0.44 Gm.), with the average approximating  $1\frac{1}{4}$  to  $1\frac{1}{2}$  grains (0.08 to 0.1 Gm.). Chloral hydrate (53 cases), magnesium sulfate parenterally (28 cases) and various barbiturates (15 cases) were employed to complement the morphine, these drugs are all respiratory depressants.

Other forms of therapy employed included venesection in 18 cases, mostly in the earlier years, spinal tap in 2, oxygen in 11 (7 during 1941), concentrated dextrose solutions intravenously in 49 and concentrated

sucrose solutions in 10, mostly since 1932. Scopolamine hydrobromide, atropine, theophylline with ethylene diamine and mercurous iodine were each given to 1 to 3 patients on special indication. Transfusions were employed twice in the presence of shock and hemorrhage, but both patients died.

#### MATERNAL DEATHS

The total maternal deaths numbered 7, a fatality rate of 8.75 per cent. Six of the 7 women who died had antepartum (4) or intrapartum eclampsia (2) before admission, while the other was a 45 year old primigravida who was delivered spontaneously, had a single convulsion one hour and twenty minutes later and died from uncontrollable uterine hemorrhage and shock (fibroid uterus) four hours after the seizure. Autopsy was permitted for 3 of the other 6 patients and showed the deaths to be due to (1) infection (*Escherichia coli* septicemia) after vaginal hysterotomy, (2) bilateral pneumonia with infarction of the anterior lobe of the hypophysis (normal liver) and (3) cardiac dilatation, pulmonary edema and eclamptic liver. Two of the patients for whom necropsy was not permitted died of shock (they had been brought 30 and 150 miles respectively to the hospital while having frequent convulsions), while the third had clinical failure of the left side of the heart and pulmonary edema unrelied by venesection.

#### FETAL SURVIVAL

The survival rate among the 84 infants (4 sets of twins) was 53.6 per cent (45 lived), with the salvage according to birth weights as indicated in the accompanying table.

Exclusion of the 18 "previable" children, weighing less than 1,500 Gm., among whom there was only 1 survivor, leaves 66 with a reasonable chance of survival. The actual salvage was 44, or 66.7 per cent. Three of the other 22 children died during the first day, while 19 were stillborn, including 9 that were macerated. The toxemia appears, therefore, to have been the direct cause of the high fetal death rate either by inducing or necessitating premature delivery or by producing intrauterine fetal death.

#### INCIDENCE

During the interval under consideration there were 15,327 deliveries, and the incidence of eclampsia was 1 in 191. The yearly incidence varied from 1 in 57 deliveries in 1927 to 1 in 956 in 1940, for no determinable reason. The greatest numbers of cases occurred in May (11) and June (10) and the smallest in August (2). There were 52 in the first six months as against 28 in the second half of the calendar years. This distribution supports the old clinical observation that the late spring months show an increased eclamptic incidence. Three of the fatalities occurred in the first six months (3 in 52, or 1.17%), while there were 4 in the second six months (4 in 28, or 1.7%). This suggests that eclampsia may be less severe when it is more frequent.

#### PARITY

Primigravidity is recognized as predisposing to eclampsia, and 59 women (73.7 per cent) of this series had not previously been pregnant. Greater interest, however, attaches to the 21 multigravidas in whom convulsions developed. The number of previous pregnancies varied from one to twelve, and 13 women had had three or more. According to the histories, 12 had had toxemia previously, although the majority had had

<sup>5</sup> Geraghty, W. R. Encephalopathy from the Therapeutic Use of Lead and Opium Pills, *J. A. M. A.* 110:208 (Jan. 15) 1938.  
From the Department of Obstetrics and Gynecology, State University of Iowa College of Medicine.

no antepartum case and minor grades of toxemia may have passed unnoticed while 5 had had nonconvulsive toxemia and 4 eclampsia.

The mortality rate among the multigravidas was considerably greater (14.3 per cent) than in the primigravidas (8.5 per cent) as is consistent with the observation that most of the former group suffered from chronic hypertensive vascular disease which was aggravated by the pregnancy and were older. The more severe character of the disease in multigravidas is likewise indicated by the lower infant survival rate, 50 per cent, and the fact that the convulsions tended to develop before the beginning of the last trimester of pregnancy, 8 of the 22 infants weighed less than 1,500 Gm. at birth.

#### AGE

Eclampsia is a disease of young women and it is not surprising to find that 33 of the 80 patients were less than 20 years of age. Moreover, in these young women the disease is ordinarily not complicated by preexisting cardiovascular or renal disease, and the prognosis is therefore more favorable. There were no deaths in the age group under 20 years. In the third decade of life (20 to 29 years) there were 28 cases of eclampsia with 3 deaths, 10.7 per cent; in the fourth, 14 cases with 2 deaths, 14.3 per cent; and in the fifth, 5 cases with 2 deaths, 40 per cent.

#### ONSET OF CONVULSIONS IN RELATION TO LABOR

The chief concern with an eclamptic patient actually in labor is to insure a relatively safe and rapid vaginal delivery after complete dilatation. Labor began spontaneously in 16 of the 43 cases of antepartum eclampsia and was induced contrary to clinic policy, in 2 of the remaining 27. Among the 25 cases of "intercurrent eclampsia" the interval between the final convulsion and the onset of labor varied from two to seventy-two days but was more commonly two to four days. The actual delivery was spontaneous in 15 women with vertex and in 3 with breech presentations, with low forceps in 6 and with vaginal hysterotomy in 1 (birth weight 365 Gm.).

In the 43 cases in which the convulsions appeared before the onset of labor there were 4 deaths (9.3 per cent), as against 2 deaths (11.8 per cent) in 17 cases of intrapartum eclampsia and 1 death in 20 cases of postpartum eclampsia (5 per cent). Evidence to substantiate the belief that the higher mortality in antepartum and intrapartum eclampsia is attributable to the effect of labor is afforded by a considerable experience with cases of intercurrent eclampsia, in which delivery occurred two or more days after control of the convulsions and disappearance of the coma. There were 25 such cases with 1 death (4 per cent), while in the remaining 18 cases of antepartum eclampsia in which labor began during or shortly after the seizures there were 3 deaths (16.7 per cent). Moreover, the 1 death in the group with intercurrent eclampsia occurred from infection nine days after vaginal hysterotomy for removal of a fetus weighing 365 Gm. The operation was performed eight days after admission to the hospital which had occurred shortly after two typical eclamptic convulsions with clinical evidence of hypertensive vascular disease. Experience of this character leads inevitably to the conclusion that labor should not be induced during the convulsive stage of eclampsia and that radical methods of delivery should not be employed.

Intercurrent eclampsia naturally carries a high fetal death rate; there were only 6 surviving children (24

per cent) in the 25 cases. Eleven patients with this form of eclampsia went into labor spontaneously or after induction more than seven days after the last convulsion (the longest intervals were forty-three and seventy-two days), but only 2 children (18.2 per cent) survived. In no instance was there a recurrence of the convulsive attacks, and in several instances, including the patient who expelled a 350 Gm. dead fetus after an interval of seventy-two days, the signs of toxemia largely disappeared before delivery occurred. In the usual case this can possibly be explained by death of the fetus, but such an explanation cannot hold for the 2 women who were delivered of living and surviving children seven and nine days respectively after one and eight convulsions.

Obviously the only reason for permitting an eclamptic patient to remain undelivered for more than a day or two after the convulsions and coma have disappeared concerns the possible survival of the fetus. This chance has been shown to be remote and can scarcely balance the risk that continuance of the pregnancy, even when the toxic manifestations are minimal, may produce or aggravate chronic vascular or renal damage. Considerable experience with cases of intercurrent eclampsia

*Infant Survival According to Birth Weight*

| Birth Weight       | Total | Died | Survived |          |
|--------------------|-------|------|----------|----------|
|                    |       |      | Number   | Per Cent |
| Under 1,000 Gm.    | 8     | 8    | 0        | 0.0      |
| 1,000 to 1,499 Gm. | 10    | 9    | 1        | 10.0     |
| 1,500 to 1,999 Gm. | 11    | 8    | 3        | 27.3     |
| 2,000 to 2,499 Gm. | 14    | 5    | 9        | 64.3     |
| 2,500 to 3,499 Gm. | 21    | 8    | 13       | 61.9     |
| 3,500 Gm. and over | 5     | 1    | 4        | 80.0     |
| Total              | 54    | 39   | 15       | 53.6     |

dictates the belief that there is no acceptable reason for delaying the induction of labor after the patient is prepared to face delivery with relative safety.

#### NUMBER OF CONVULSIONS

The number of convulsions ranged from one to eighteen, with the majority of patients (48) having no more than three. Among these 48 women there were 4 deaths (one, two, two and three convulsions respectively), or 8.3 per cent, while among the 32 women with four to eighteen convulsions there were 3 deaths, 9.4 per cent, after six, nine and eighteen convulsions respectively.

The fetal survival rate, however, was adversely affected by more than three convulsions, so that only 14 of 33 children (one set of twins) survived (42.4 per cent), as against 31 survivors out of 51 infants (three sets of twins) among the women who had no more than three seizures (60.8 per cent). This is consistent with the common observation that the number of convulsions is generally an index of the severity of eclampsia. The fact that the maternal mortality was not significantly increased by the greater number of convulsions may be correlated with the higher stillbirth rate in the latter group, fetal death is known to have a favorable influence on the course of eclampsia.

#### FEVER AND SHOCK

It is well recognized that the appearance of fever or the development of shock in eclamptic patients adversely affects the prognosis. In this series, 5 of 18 women with temperature elevations above 100 F° died and 4 of 15 exhibiting shock, manifested by

tachycardia and low blood pressure, succumbed. In 3 of the fatal cases both fever and shock appeared, while only 1 fatality showed neither sign at the time of the convulsions, in this instance death occurred several days later from infection.

## COMMENT

The preceding data have established the relatively low maternal mortality rate in a consecutive series of 80 eclamptic patients treated by a routine technic which aims at controlling the convulsive seizures without purposely interfering with the pregnancy. Study of these 80 patients during the eclamptic seizures and later review of their written histories have brought forth certain ideas which appear pertinent.

It is probably significant that only 1 patient died among the 43 whose convulsions developed after admission to the hospital. Five patients died soon after admission either from the toxemia or from some direct sequel. These patients were transported from 30 to 150 miles to the hospital after the onset of convulsions and were admitted in coma. Moreover, 3 of the 5 were in severe shock on admission, while another had early bronchopneumonia. It is difficult to escape the conclusion that the long journey contributed to the unfavorable clinical condition on admission and therefore to the fatal issue. It may even be argued that intensive medical therapy at home or in a nearby small hospital would have been preferable to the longer journey to the larger institution.

In view of the dramatic character of eclampsia, it is easy to understand the tendency toward overtreatment. There is an urge to do everything possible, and consequently therapy becomes so extensive as to be confusing or even dangerous. The primary objectives of medical therapy in eclampsia are to provide adequate sedation and to encourage urinary output. It is also essential that these objectives be attained with as little disturbance to the patient as possible, annoying subsidiary forms of treatment should be avoided unless they seem absolutely necessary, which is rarely the case. The induction of labor and delivery by surgical means fall definitely into the latter category, and the poorer results obtained when they are employed can be adequately explained by the fact that they place additional burdens on an organism which is already strained to handle the underlying metabolic or toxic disturbance.

Morphine is a reliable, powerful and available sedative, and little, if anything, is to be gained by supplementing its effect with other drugs, which have no specifically different action and probably are not synergistic in the true sense of that term. A personal preference for any other sedative does not alter the argument, provided the dosage is sufficient to produce the desired result—reduction of the respiratory rate to the neighborhood of 12 per minute.

Hypertonic sugar solutions are effective diuretic agents and rarely fail to promote urinary secretion. Dextrose is probably to be preferred over sucrose, in spite of the more potent action of the latter, and 25 per cent solutions are adequate. Occasionally venesection is valuable, but its use should be limited to patients with full, bounding pulses, and circulatory collapse must be kept in mind.

## SUMMARY AND CONCLUSIONS

In a consecutive series of 80 eclamptic patients treated medically there were 7 deaths, 8.75 per cent. Increasing age and parity influenced the prognosis unfavorably.

The uncorrected fetal mortality rate was 46.3 per cent. Exclusion of all "previable" children, weighing less than 1,500 Gm., reduced the fetal and infant fatality rate to 33.3 per cent.

The maternal deaths attributable to the toxemia (5 in number) occurred exclusively in women with antepartum or intrapartum convulsions, who were transported considerable distances to the hospital and who arrived in shock or on the verge of circulatory collapse.

Eclampsia is a medical problem which is best combated by sedation and by attempts to produce diuresis.

The eclamptic patient should be disturbed as little as possible.

Treatment at or near home is preferable to a long trip to a hospital, which too frequently induces circulatory collapse.

University Hospitals

## RADIUM THERAPY FOR VULVAR CONDYLOMAS

S. L. WOLTERS, M.D.

AND

H. CLOSE HESSELTINE, M.D.

CHICAGO

The total removal of condylomata acuminata of the vulva and vagina and the complete protection against a recurrence is a problem which occasionally confronts the gynecologist and obstetrician. The prevalent therapy by excision, cauterization and the like with the hazard of serious loss of blood, excessive scarring and temporary incapacitation has not proved satisfactory. Disagreement on treatment is fostered by the views of various authorities as to the most satisfactory method. The subject is discussed only briefly in standard works on dermatology and on gynecology and in the literature very rarely. To evaluate the use of radium on condylomata acuminata 11 cases have been observed frequently and over a prolonged period. The procedure was not only successful but also convenient, safe and simple and with minimal inconvenience for the patient. This report comes forth not because it is new but because detailed description in the literature to guide the therapist was not found.

It is acknowledged generally that condylomata acuminata of any extent increase the chance of abnormal blood loss or puerperal infection in association with delivery. Therefore, if these increased hazards can be eliminated or reduced in the removal of the condylomas, treatment during pregnancy is important and frequently urgent. Such therapy should be free from danger to the fetus and to the patient.

## LITERATURE

Ormsby<sup>1</sup> states that the disease is automuculable and contagious, although the causative organism has not yet been identified. It has been suggested that this condition may be caused by a virus. Until recently condyloma acuminatum or venereum had been looked on as probable evidence of a present or prior gonococcal gonorrheal infection and hence the lay name of venereal warts. Nowadays it is acknowledged that any chronic or persistent vulvovaginal discharge (venereal or non-

Dr. Gordon T. Burns made the photographic records.

<sup>1</sup> Ormsby, O. S. Diseases of the Skin, Philadelphia, Lea & Feb. 1937.

venereal) may precede or be concomitant with these warts, which is in perfect accord with the observation of this report.

Various methods of treatment have been described. Surgical excision seems to be the most popular. It may, however, be associated with excessive and even serious

Fig 1—Wide distribution of condylomas six days after delivery of a woman aged 20 at time of first radium therapy

loss of blood, especially if the lesions are multiple and extensive, in addition to the aforementioned inconvenience to the patient. The Crossens<sup>2</sup> emphasize the potential hazard of excessive loss of blood and also the possible development of a hematoma even in spite of good surgical technic. According to them, anal condylomas are not satisfactorily treated by radiation. Recurrences are frequent after surgical removal. Treatment with keratolytic agents, such as salicylic acid and resorcinol, and with chemical caustics and acids has also been advised. Results with these agents are not only hazardous but also unpredictable and do not safeguard against recurrence. Ormsby suggests that roentgen therapy is valuable but does not elaborate further. Curtis<sup>3</sup> states that radium and roentgen rays have been employed but states further that not enough cases have been recorded to justify conclusions. Schmitz<sup>4</sup> records a series of 13 cases in which roentgen therapy was used with recoveries in 11. In this series an average dose of 450 roentgens was used. The Suttons<sup>5</sup> suggest a dose of 1,200 roentgens to individual warts. The shifting attitude by Andrews<sup>6</sup> is evidenced by his advice to use an acid or a cautery for small lesions and

subsequent treatment by "subintensive" doses of roentgen rays. For the extensive lesions he suggests from 50 to 100 millicuric minutes for each square centimeter, or a total of 500 to 1,000 roentgens filtered through 3 mm of aluminum.

Korbler<sup>7</sup> reports an extensive formation of condylomas on the penis which was almost completely removed in 1 instance by radium.

According to Adair,<sup>8</sup> the first therapy should be directed toward removing the predisposing cause and subsequent excision or coagulation of the warts. He suggests that irradiation may be used and intimates that this therapy may become the one of choice.

It should be borne in mind that condylomas which develop during pregnancy vanish spontaneously at times after parturition.

#### PROCEDURE AND RESULTS

In a series of 11 cases, 6 obstetric and 5 gynecologic, topical application of radium was the sole means of treatment. The series is small because these lesions are seldom seen in our clinic. A few of the patients were referred to us by the Municipal Social Hygiene Clinic (Chicago) for the purpose of making this study.

While none of the lesions were extensive in the strict sense, they caused the patients enough distress to seek relief. Six of the patients had had a chronic vaginal discharge and tests established the diagnosis of vaginal trichomoniasis. One had a history of gonorrhea pre-

Fig 2—Same patient as in figure 1 fifteen weeks later. A total of 225 milligram hours of radium was given. 150 milligram hours of radium at first application and 75 milligram hours of radium nine weeks later. No recurrence to date.

and the patients, with 1 exception, were either nulligravidas or primigravidas. The presence of the lesions had been known to the patients from one month to two years.

The actual procedure was extremely simple. The dosage had to be worked out by the trial and error

Fig 3—Condylomas principally on left labium majus of woman aged 40 four days after delivery at time of radium therapy

method, we started out with small dosages and repeated the applications when necessary until it was learned how large a dose was necessary to eliminate the lesions entirely. The radium at our disposal was in two capsules of 50 mg each. The radium was contained in 0.5 mm platinum capsules and was filtered through 1 mm of aluminum. The object in using a large amount of radium was to reduce the time of application. A few patients had treatments in the hospital during the puerperal period, but most of them were treated in the out-clinic. With the patient on a table or cot, the radium in its container was placed directly over the portions of the vulva affected and held in place with strips of adhesive and a perineal pad. The patient rested quietly in the supine position with the legs and thighs extended. It was unnecessary to remove the pubic or genital hair. When the radium was not sufficiently close to all the condylomas it was moved from one site to another for the estimated dose. Periodic inspections were made to be sure that the radium had not become displaced. Each patient spent from one to two and one-half hours in the clinic for the first treatment. Repeated applications were made in those instances in which the first treatment was insufficient.

In 1 instance in which the lesions were confined to a small area only 75 mg hours of radium was necessary to produce complete retrogression. In another case with extensive involvement 450 mg hours had to be used. The latter was divided into two applications one month apart. The optimal dose seems to be about 100

mg hours to an area of about 4 sq cm. The adjacent picture and the footnotes should give some relative idea on dosage and response in these respective instances.

For two to three weeks after the treatment a few of the patients showed a mild localized erythema of the vulva which was entirely asymptomatic. Aside from the dermal reactions, undesirable side effects were not noticed. There was no obvious change in the growth of hair.

Six patients made their return visits from fifteen to fifty-two weeks after treatment. It was only through persistence that they were persuaded to return for an examination. With their complete relief it was believed by them that other visits were unnecessary. In view of the early loss of symptoms in those under close observation, the retrogression or disappearance should occur gradually and within a few weeks at most. If this should not occur, more radiation is indicated. Most of the members of this group have been followed after complete involution of the condition for several months to over a year and in not 1 has there been a recurrence.

From the data studied it is definite that the period of symptoms and perhaps the age of the condylomas are unrelated to the response after exposure to radium. By comparison it seems equally evident that the variation in response is more directly related to the extent of the lesions, that is, the greater the area or extent of involvement, the slower and less yielding to a given dosage of radium.

Fig 4—Same patient as in figure 3 eight weeks later. A total of 200 milligram hours of radium, all in one application. No recurrence.

The dosage is important and the radium should be properly screened to avoid an undesirable cutaneous reaction. Repeated application at three or four week intervals seems justified when the regression is progressing sufficiently well.

Bull. Louisiana State Board of Health 13: 161 (Sept.) 1922

## TREATMENT

Patient 1 was given 10 minims (0.6 cc) of epinephrine hydrochloride solution with relief of pain. It was necessary to repeat the dose later.

Patient 2 was given  $\frac{1}{20}$  grain (0.003 Gm) of morphine sulfate, after which she went to sleep.

Patient 3 took 20 grains (1.3 Gm) of acetylsalicylic acid without relief.

Patient 4 applied calamine lotion locally and took calcium tablets without relief, later aromatic spirit of ammonia was applied locally with partial relief, but codeine was required for relief of pain and for rest.

It appears that relief of symptoms must be obtained by means of a drug having a generalized effect, such as epinephrine, morphine or codeine. Much remains to be learned concerning the proper handling of the patients for the most effective alleviation of their symptoms.

## CONCLUSIONS

1. Megalopyge opercularis larva is capable of producing poisoning.

2. It is widely distributed in the Southeastern states and is possibly spreading to neighboring areas.

3. It may be found on a wide variety of plant life.

4. June through September are the months during which it is most likely to cause trouble.

5. Both local and general symptoms may be produced. The local symptoms are burning pain, itching and the appearance of whitish and reddish papules and vesicles. The general symptoms are nervousness, restlessness, headache, muscle cramps, tachycardia and generalized itching.

6. The local application of drugs is of slight or questionable value.

7. Drugs having a general or systemic effect are required, epinephrine, codeine and morphine are the most effective drugs used thus far.

## THE MORPHOLOGY OF SPIROCHAETA PALLIDA IN THE ELECTRON MICROSCOPE

UDO J. WILE, M.D.

Professor of Dermatology and Syphilology,  
University of Michigan Medical School

ROBERT G. PICARD

Research Associate in Physics

AND

EDNA B. KEARNY

Assistant Hygienic Laboratory

ANN ARBOR, MICH.

The demonstration of *Spirochaeta pallida* in the electron microscope can be accomplished only after the organisms have been completely immobilized, centrifuged and subjected to repeated washing. Centrifugation and washing are necessary to free the organisms as far as possible from organic material, crystals and other foreign minutiae which interfere with the clear observation of the organism.

The extreme fragility of *Spirochaeta pallida* and its rapid immobilization and disintegration under conditions of desiccation, would therefore seem to make its demonstration in the electron microscope a procedure of great technical difficulty.

Fig. 1.—View showing continuous envelope or membrane also end knob.

We have, however, succeeded in demonstrating these organisms in every case examined even under the adverse conditions mentioned. The cases from which specimens have been secured have all been fresh untreated cases of syphilis. Material has been examined from both chancres and secondary lesions. In each case the syphilitic lesion has been repeatedly washed with isotonic solution of sodium chloride. The specimens, as free from blood as possible, were drawn from the lesions by applying a suction cup and gently with drawing serum from the cleansed surfaces. In order to diminish the number of surface organisms, the first specimens thus aspirated were discarded. The serum thus obtained from the deeper portions of the lesion was first examined in the dark field and only those specimens in which spirochetes alone occurred were subjected to examination in the electron microscope.

## PREPARATION OF SPECIMENS FOR EXAMINATION

The serum from the surface of the aspirated lesion was drawn up into a capillary pipet and immediately placed in from 0.5 to 1 cc. of isotonic solution of sodium chloride. Where macroscopic evidence of blood or other particles of tissue were seen, the specimen was sub-

**The Humane Application of Medical Knowledge —**  
The science of medicine, like all science, is a body of knowledge and a technic of intellectual inquiry. The art of medicine, in contrast, is the humane application of this knowledge to the alleviation of human suffering and the promotion of human welfare. It is concerned with human individuals, human hopes and fears. The importance of this fact can hardly be exaggerated. It is one of the tragedies of medicine that the complexities of modern science and of medical techniques tend so powerfully to accentuate the impersonality of medical treatment. The great laboratories and gigantic hospitals, the complicated routines of consultation and diagnosis, the need for discipline and the impersonal objectivity which necessarily characterizes all truly scientific inquiry encourage a factory-like routine and a neglect of the human factor. But the patient craves not merely your scientific skill but your human understanding and sympathy. He is in trouble and afraid, afraid to hear your verdict, afraid to face whatever suffering may be in store for him. He wants to know the truth, however grim, yet fears the truth. He turns to you not only for your skill but also for friendliness and courage, sympathy and understanding. Can you remember this in the busy days and nights that lie ahead? Can you imaginatively identify yourselves with the patients and despite all routine and all weariness, respond to their human needs? Yours is a unique opportunity, as doctors and as nurses, to help your fellow men in times of suffering and loneliness, anxiety and fear.—Greene, Theodore, M. *Medicine in Peace and War*, *Virginia M. Monthly*, August 1941.

jected to centrifugation at low speed for ten minutes. Both the sediment and the supernatant fluid were examined in the dark field, organisms being found in both but to a greater extent in the supernatant fluid. The isotonic salt suspension was then centrifugated at 1,630 revolutions per minute for thirty minutes. The supernatant fluid was discarded, and the sediment resus-

Fig. 2—Appearance of end knob

pended in distilled water. After a second centrifugation at the same speed and time, the sediment was finally suspended in 2 to 3 drops of distilled water, from which suspension specimens for final examination were made.

A small drop of suspension was then placed on a collodion film, supported on a 200 mesh, stainless steel, woven screen. The collodion film is prepared from 1 per cent collodion in amyl acetate. After drying, the wire screen is placed in a specimen holder and inserted into the electron microscope<sup>1</sup> and examined. Each screen is a disk  $\frac{1}{8}$  inch in diameter and each mesh is about  $\frac{1}{300}$  inch square. Approximately twelve squares can be examined in each screen.

As mentioned before, every specimen in which spirochetes were demonstrated in abundance by the dark field yielded a few organisms which survived centrifugation, washing and examination in vacuo necessary to their demonstration in the electron microscope.

As might well be expected, the majority of organisms were fragmented. We were fortunate, however, in being able to study many organisms which were still completely intact. In every case, however, considerable distortion occurred. The most characteristic change

Fig. 3—Outline of membrane

which might obviously have been expected was a flattening out of the coils so that the shape of the organism no longer conformed to the tight coiled spring shape of the organism as seen in the living specimen.

The specimens were photographed at a magnification of 8,000 diameters and some details not noticeable by

direct examination were brought out by the photographs. Our most interesting finding, which may be seen in figure 1, is what would appear to be a continuous envelope completely covering the organism. This, however, was not a uniform finding, although it was faintly seen in a few specimens and apparently absent in many others.

It is not entirely certain that this appearance is actually due to a membrane. A second possibility is that the appearance is the result of an artefact due to the deposition of material from the suspended fluid which might form around the organism by evaporation. The uniformity of the membrane-like structure, however, as seen in figure 1, together with the lack of debris in this field, makes it seem likely that the appearance is not due to an artefact.

The frequency with which spirochetes appear to be attached to one another at some distance from their apparent ends in the dark field has led to the suggestion that they may be provided with flagella. Our specimens under the high magnification fail thus far to demonstrate the existence of flagella. However, in many specimens a curious knoblike structure was seen at the end of many organisms. Their almost uniform shape and density suggest that these are not extraneous particles of the preparation but a part of the organism itself.

Fig. 4—Another view of end knob

#### COMMENT

Notwithstanding the technical difficulties necessary to demonstrate *Spirochaeta pallida* in the electron microscope, which necessitate complete immobilization and desiccation, this organism can be successfully examined at very high magnification. As seen in the electron microscope a distortion, lengthening and flattening of the coils ascribable to the technic of preparation occurs.

A complete and continuous membrane-like structure around the organism was demonstrated, the exact nature of which is still somewhat in doubt.

Flagella could not be demonstrated at the end of the organisms, but curious knoblike structures of fairly uniform density seemed to be integrated with the body of the organism. Further studies are being undertaken in the attempt to reduce the distortion by a simplification of the technic of preparation.

While the technic of demonstration is attended with considerable difficulty, the material after implantation on the collodion film can be successfully examined over a period of several days and may be successfully reexamined after exposure to the beam.<sup>2</sup>

<sup>2</sup> Since this manuscript was prepared we have successfully demonstrated the existence of flagella-like processes in several instances by enlarging our magnifications to the point of 75,000 to 80,000 diameters. With this very high magnification flagella similar to those seen in other bacteria are readily demonstrable. These occur at various points along the course of the organism and not at the two ends. A separate report concerning their occurrence is under preparation.

## Clinical Notes, Suggestions and New Instruments

### THE INSTANTANEOUS DIAGNOSIS OF ALKAPTONURIA ON A SINGLE DROP OF URINE

ELLA H. FISHBERG, M.D., NEW YORK

Alkaptonuria is a rare metabolic anomaly characterized by the tendency of the urine to turn dark on exposure to air, owing to the fact that the urine contains homogentisic acid. The constitution of this compound, which is chemically 1,4-dihydroxyphenylacetic acid

shows that it may be regarded as a derivative of hydroquinone and points the way to its instant detection in urine.

The urine is made strongly alkaline with sodium or potassium hydroxide and dropped on regulation sensitized photographic paper. Wherever a drop of the urine touches the paper the latter turns coal black instantly, a process exactly similar to that used in everyday photography. This may be done in full daylight.

We have found no other substance present in urine, either normally or pathologically, which is capable of reducing the photographic paper in this manner. Diabetic urine, no matter how high the concentration of reducing sugar, remains without effect. Also, the higher concentrations of vitamin C present in urine after metabolic experiments do not act in this manner.

Since alkaptonuria is either total or absent and the substance is excreted in quantities as high as 16 Gm. a day, usually however about 3 to 5 Gm., the reaction is unlikely to be negative in an alkaptonuric patient at any time.

Specimens of alkaptonuric urine from 3 patients referred to me by Drs. Stanley Benedict and Henry Jaffe were all consistently positive with this test, and my associates and I have been unable to find any other specimen of urine in this hospital over a period of eight years which was positive. Homogentisic acid isolated from one of the positive urines itself gave a strongly positive reaction.

Stuyvesant Park East

### HEMOTHORAX COMPLICATING HEPARIN THERAPY

JOHN W. KEYES, M.D., AND CARL F. SHAFFER, M.D.,  
DETROIT

Heparin has been used as an anticoagulant in the treatment of various conditions involving thrombosis and embolism.

One of the most frequent uses of heparin has been in preventing postoperative embolism with pulmonary infarction. The following report is of a complication resulting from the use of this substance for this condition. That such a complication has not been reported previously is rather surprising when one considers the physiologic changes of coagulation and the pathologic changes of pulmonary infarction.

#### REPORT OF CASE

M. G., a Negress aged 30, was admitted to the hospital with a diagnosis of uterine fibromyomas. A supravaginal hysterectomy was done with the patient under ethylene and ether anesthesia. After the fifth postoperative day she continued to have daily elevations in temperature, her temperature ranging from 100 to 101 F. There was a proportionate increase in the pulse rate but no leukocytosis. She was asymptomatic, and there were no physical signs of pathologic changes in the lungs.

On the tenth day the patient complained of sharp pain in the lower part of the chest on the right side aggravated by respiration. Physical examination revealed slight relative impairment of percussion and decreased breath sounds in this

area. Five days later the patient had a similar type of pain in the lower part of the chest on the left side with physical evidence of another small pulmonary infarction.

During the ensuing two weeks the convalescence was uneventful. At the end of this time, one month after the operation, a third and larger pulmonary infarction occurred in the lower lobe of the left lung. There was impairment of the percussion note and the breath sounds were of bronchial character. No friction rub was heard. The temperature gradually rose to 104 F. and the pulse rate to 120 a minute.

General heparinization was begun three days later. The method of administration used at the Henry Ford Hospital has been previously discussed by Lam.<sup>1</sup> One hundred mg. of the crystalline salt is added to 500 cc. of isotonic solution of sodium chloride and given by the intravenous route. The clotting time is measured by the capillary tube method, and determinations are made at least three times a day. The amount of heparin required to elevate the clotting time to the optimum level of approximately fifteen minutes varies with each patient. In our patient by the proper regulation of dosage this level was maintained after twenty-four hours.

Symptomatic treatment was continued. There was no significant clinical improvement during the next five days. A moderately high temperature and rapid pulse were associated with increasing dyspnea. On the fourth day after heparin therapy was started there was fluid in the left pleural cavity, and twenty-four hours later a thoracentesis was performed. One liter of fluid resembling venous blood in appearance was removed. The erythrocyte count of this fluid was 1,500,000 per cubic millimeter and that of the circulating blood 2,500,000. There was instant relief from dyspnea and tachycardia.

The administration of heparin was discontinued. The patient was given a transfusion of 500 cc. of whole blood and placed in an oxygen tent. Two mg. of menadione and 200 mg. of calcium were given intravenously with the transfusion. At the end of twelve hours the clotting time had returned to six minutes.

Two days later 750 cc. of bloody fluid was removed, and the concentration of erythrocytes was 2,000,000 per cubic millimeter. The prothrombin value of the blood of the circulation was 50 per cent. A second transfusion with added vitamin K was given. Forty-eight hours later a final thoracentesis yielded an additional 250 cc. of bloody fluid. The circulating erythrocytes had increased to over 4,000,000 per cubic millimeter and the prothrombin value to 75 per cent. There was a corresponding improvement in the clinical picture with a gradual fall in temperature and pulse and respiratory rates.

Cultures of the pleural fluid and blood were negative. There was no evidence of bleeding elsewhere as the result of heparinization. A total of 2 liters of bloody fluid was removed from the left pleural cavity.

#### COMMENT

Since this case report has been completed another similar instance has occurred. A patient recovering from an open reduction of a fractured femur had his first pulmonary infarct in the lower lobe of the right lung. Heparin administration was begun but was discontinued on the third day because of recurring chills and fever. Severe secondary anemia required transfusions at this time. A second pulmonary infarction occurred in the right side of the chest ten days after the first and a third one eight days after the second. Roentgen examination showed bilateral pulmonary infarction. Evidence of pleural fluid was followed up by thoracentesis on the nineteenth day and removal of 600 cc. of bloody fluid resembling venous blood. A second tap yielded another 600 cc. of similar material four days after the first. The red blood cells in this fluid were 1,280,000 per cubic millimeter. This fluid was practically identical to that in the preceding case. The circulating blood prothrombin was 80 per cent. It is quite possible that the hemothorax was present but to a less degree even at the time heparin was being given.

A series of 60 patients have received heparin at the Henry Ford Hospital, three fourths of whom had pulmonary infarction.

From the biochemical laboratory of the Beth Israel Hospital, New York.  
From the Department of Medicine, Henry Ford Hospital, Detroit.

<sup>1</sup> Lam, C. R. Heparin Administration. *Ann Surg* 114: 233 (A), 1941.

The 2 we have described are the first in whom hemorrhage into the pleural cavity has occurred in association with this form of therapy. Priestley and his co-workers<sup>2</sup> have had no serious hemorrhage in their case.

The value of heparin as a prophylactic agent in postoperative pulmonary embolism and thrombosis has already been established. The occurrence of complications as contained in this report does not outweigh this value and should not deter one from its use.

## Council on Pharmacy and Chemistry

### NEW AND NONOFFICIAL REMEDIES

THE FOLLOWING ADDITIONAL ARTICLES HAVE BEEN ACCEPTED AS CONTRIBUTING TO THE RULES OF THE COUNCIL ON PHARMACY AND CHEMISTRY OF THE AFRICAN MEDICAL ASSOCIATION FOR ADMISSION TO NEW AND NONOFFICIAL REMEDIES. A COPY OF THE RULES ON WHICH THE COUNCIL BASES ITS ACTION WILL BE SENT ON APPLICATION.

ALVIN F. SMITH, M.D., Acting Secretary

**ACETYL-BETA-METHYLCHOLINE** (See Revised Supplement to New and Nonofficial Remedies, 1941, p. 3)

The following product has been accepted:

**MECHOLYL BROMIDE**—Acetyl beta methylcholine bromide—Trimethyl beta acetoxy-propyl ammonium bromide—The acetyl ester of beta methylcholine bromide.

**Actions and Uses**—The actions of mecholyl bromide are the same as for mecholyl chloride but because it is less hygroscopic than the latter salt it is suitable for oral use in tablet form for the treatment of those conditions in which this route of administration of the drug is recognized. See the article, Mecholyl Chloride, N. N. R. 1941 Revised Supplement, page 4. Claims for the use of mecholyl bromide other than by oral administration are not permissible and it should be kept in mind that for those skilled in the technique of ion transfer (iontophoresis) is generally to be preferred in the treatment of chronic ulcers, scleroderma, Raynaud's disease and other vasospastic conditions of the extremities, except possibly the management of vascular spasm from exposure to moderate cold.

**Dosage**—Mecholyl bromide is administered in doses of 0.2 to 0.6 Gm (one to three tablets) two or three times daily, 0.05 to 0.1 Gm ( $\frac{1}{4}$  to  $\frac{1}{2}$  tablet) may be sufficient to overcome vascular spasm due to moderate exposure to cold but in chronic ulcers, scleroderma and Raynaud's disease the larger doses are required. With patients in whom a total daily dose of 2 Gm (10 tablets) of the drug is not effective the oral method of treatment should be abandoned in favor of the use of mecholyl chloride by subcutaneous administration or local application by the method of ion transfer (iontophoresis).

#### Tests and Standards—

Mecholyl bromide occurs as a white crystalline very hygroscopic powder possessing a slight fishy odor readily soluble in water and alcohol insoluble in benzene and ether. The aqueous solution is neutral to litmus. Mecholyl bromide melts at 147-149°C.

Dissolve about 1 Gm of mecholyl bromide in 10 cc of water to a 1 cc portion add 1 cc of alcohol and 1 cc of sulfuric acid and heat in a steam bath the odor of ethyl acetate becomes perceptible to another 5 cc portion add 2.5 Gm of potassium hydroxide and heat (odor of trimethylamine is noticed) to the remaining portion add an excess of silver nitrate solution (a white curdy precipitate soluble in ammonia water results). Add 3 cc of a 20 per cent aqueous solution of sodium perchlorate to 2 cc of a 10 per cent solution of mecholyl bromide shake thoroughly and cool in ice water no precipitate is formed (acetylcholine). Moisten about 0.1 Gm of mecholyl bromide with a 5 per cent solution of platinum chloride small rhomboid plates are formed (distinction from acetylcholine chloride which forms needles and choline chloride which forms no crystals). Dissolve 0.2 Gm of mecholyl bromide in 2 cc of sulfuric acid the solution is colorless (readily carbonizable substances).

Dry about 0.5 Gm of mecholyl bromide accurately weighed to constant weight at 110°C the loss in weight does not exceed 1.5 per cent. Incinerate about 0.5 Gm of mecholyl bromide accurately weighed in a platinum crucible the residue does not exceed 0.1 per cent. Transfer about 0.5 Gm of mecholyl bromide previously dried at 105°C to 110°C to a 500 cc Kjeldahl flask and determine the nitrogen content according to the official method described in Methods of Analysis of the Association of Official Agricultural Chemists the percentage of nitrogen is not less than 5.6 nor more than 5.9.

Dissolve about 0.4 Gm of mecholyl bromide previously dried at 105°C to 110°C and accurately weighed in 15 cc of water in an

Erlenmeyer flask add 40 cc of tenth normal sodium hydroxide solution and heat on the steam bath for forty five minutes stopper and allow to cool titrate the excess of sodium hydroxide with tenth normal hydrochloric acid using phenolphthalein as an indicator the amount of acetyl ( $\text{CH}_3\text{CO}-$ ) is not less than 17.5 per cent nor more than 18.3 per cent.

Transfer about 0.4 Gm of mecholyl bromide previously dried at 105°C to 110°C and accurately weighed to a 100 cc volumetric flask dissolve in 50 cc of water with agitation add 0 cc of tenth normal silver nitrate solution add 5 cc of nitric acid and finally add water to final volume and mix thoroughly. Filter through a dry filter into a dry flask rejecting the first filterful titrate 50 cc of the filtrate with tenth normal ammonium thiocyanate solution using ferric alum as an indicator the amount of bromine is not less than 92.9 per cent nor more than 95.5 per cent.

MERRICK & CO. INC., RICHMOND, N. J.

Mecholyl Bromide (Powder) bulk

U. S. patent 2,040,146 (May 12, 1936 expires 1955) U. S. trademark 318,783

Tablets Mecholyl Bromide 0.25 Gm (3 grains)

**OVARIES** (See New and Nonofficial Remedies, 1941, p. 372)

The following estrogen has been accepted:

SMITH-DORSEY COMPANY, LINCOLN, NEBR.

**Ampul Solution of Estrogenic Substances (in Oil)**

1 cc Each cubic centimeter contains the equivalent of 2,000 international units of estrone and 0.5 per cent chlorobutanol as a preservative in peanut oil.

**Ampul Solution of Estrogenic Substances (in Oil)**

1 cc Each cubic centimeter contains the equivalent of 5,000 international units of estrone and 0.5 per cent chlorobutanol as a preservative in peanut oil.

**Ampul Solution of Estrogenic Substances (in Oil)**

1 cc Each cubic centimeter contains the equivalent of 10,000 international units of estrone and 0.5 per cent chlorobutanol as a preservative in peanut oil.

**Ampul-Vial Solution of Estrogenic Substances (in Oil)** 10 cc Each cubic centimeter contains the equivalent of 5,000 international units of estrone and 0.5 per cent chlorobutanol as a preservative in peanut oil.

**Ampul-Vial Solution of Estrogenic Substances (in Oil)** 10 cc Each cubic centimeter contains the equivalent of 10,000 international units of estrone and 0.5 per cent chlorobutanol as a preservative in peanut oil.

**Ampul-Vial Solution of Estrogenic Substances (in Oil)** 10 cc Each cubic centimeter contains the equivalent of 20,000 international units of estrone and 0.5 per cent chlorobutanol as a preservative in peanut oil.

**SODIUM ASCORBATE**—The sodium salt of ascorbic acid  $\text{C}_6\text{H}_7\text{O}_6\text{Na}$ .

**Actions and Uses**—Sodium ascorbate possesses the activity of ascorbic acid and is preferred when parenteral therapy is indicated.

**Dosage**—Same as for ascorbic acid.

#### Tests and Standards—

A solution of sodium ascorbate may be prepared by neutralizing a solution of ascorbic acid with sodium hydroxide. The pH of sodium ascorbate solution is between 5.5 and 5.9. The ascorbic acid used in the preparation of Council accepted solutions of sodium ascorbate conforms to the tests and standards for ascorbic acid U. S. P.

GEORGE A. BREON & COMPANY, INC., KANSAS CITY, MO.

**Ampul Solution Sodium Ascorbate** 2 cc Each 2 cc contains sodium ascorbate equivalent to 100 mg (2,000 international units) ascorbic acid in sterile aqueous solution.

**POLLEN EXTRACTS—MULFORD** (See New and Nonofficial Remedies 1941 p. 44)

The following additional pollen extracts-Mulford have been accepted:

SHARP & DOHME, INC., PHILADELPHIA

Acacia Annual Salt Bush Canada Blue Grass Koeler's Grass and Scotch Broom Grass

**PROCAINE HYDROCHLORIDE** (See New and Nonofficial Remedies 1941 p. 84)

The following additional dosage form has been accepted:

E. R. SQUIBB & SONS, NEW YORK

Ampules Procaine Hydrochloride (Crystals) 500 mg

**THIAMINE HYDROCHLORIDE** (See New and Nonofficial Remedies, 1941 p. 551)

The following additional dosage form has been accepted:

JOHN WIEETH & BROTHER, INC., PHILADELPHIA PA.

Tablets Thiamine Hydrochloride 10 mg

2 Cross bleeding and hemorrhage into the pleural cavity in association with pulmonary infarction has not been previously observed in this hospital. Blood stained fluid however is frequently encountered.

## FASTING AND IMMUNITY

Well nourished persons have long been believed more resistant to infections than those who are undernourished or wasted. This belief, however, has been challenged repeatedly. Thus, even as long ago as the American Revolutionary period Underwood<sup>1</sup> pointed out that infantile paralysis most often attacks the best nourished—"finest"—children. Rous<sup>2</sup> in 1911 showed that undernourished fowl are relatively immune to sarcoma virus, while more recently Rivers<sup>3</sup> has suggested a theory to explain "malnutritional immunity" based on the assumption that undernourished cells are lacking in biotin or other stored food materials necessary for the proliferation of viruses. This is a modernized restatement of the historic exhaustion theory of acquired immunity, discarded fifty years ago on the discovery of diphtheria antitoxin.

Recently Sprunt<sup>4</sup> reported that prolonged fasting may cause a tenfold increase in the normal antiviral resistance of rabbits, provided the animals have free access to drinking water during the fasting period. In his investigations of the mechanism of this starvation immunity, Sprunt made careful quantitative studies on the susceptibility of rabbits to intradermal inoculation with vaccinia virus. Several groups of animals were deprived of food but given free access to drinking water for ten days before the test and for forty-eight hours afterward. Control groups were kept throughout the experiment on routine stock diets. Tests of dermal susceptibility were made on each rabbit with seven fourfold serial dilutions of the virus, each animal receiving seven inoculations of each dilution, or forty-nine inoculations in all. The "50 per cent point"<sup>5</sup> was determined for

each group, i. e. the viral dilution with which 50 per cent of the injections produced positive lesions. In a typical experiment the 50 per cent point for well nourished control rabbits was a viral dilution of 1/7,080,000. In the fasted animals the dosage had to be increased 93-fold (i. e. to 1/759,000) in order to produce the same 50 per cent of takes. The fasted animals, therefore, may be spoken of as being 93 times more resistant to vaccinia virus than well nourished controls. This factor varied from seven to twelve in different groups, with an average of about a tenfold increase in normal resistance for all groups.

Such data might be construed as proof that a reduction in the amount of local nutritional reserves in dermal tissues prevented viral proliferation. That other factors are also operative, however, is indicated from the observation that blebs raised by the intradermal injection of the viral suspensions subside much more slowly in the fasted animals than in well nourished controls. Parallel injections with dilute India ink showed that the spread of particulate matter is much more rapid and extensive in well nourished controls and that the decreased spread or "functional encapsulation" in fasted animals is in all cases parallel with the observed decreased infectivity.

Olitsky and Schlesinger<sup>6</sup> showed that the rate of intradermal spread of virus varies inversely with the amount of interstitial water. Increased amounts of interstitial fluid reduce the rate and area of spread, partial dehydration increases the rate and area. Sprunt believes, therefore, that the failure of virus to spread normally in starved animals is due to increased amounts of interstitial fluid, since fasting animals tend to increase the amount of their interstitial fluids if allowed free access to drinking water. This increase can be prevented by depriving the animals of water during the fasting period or by intraperitoneal injection of hypertonic salt solution. Sprunt applied both these methods and found that the rate of disappearance of the viral blebs could be increased to normal by either method. In all cases this restoration of the normal rate of spread is accompanied by an almost complete loss of the observed starvation increase in virus resistance. Depriving rabbits of food alone thus increases their resistance to vaccinia virus, largely because such fasting is associated with increased amounts of interstitial fluid.

Assuming that virus particles are autonomous biologic entities, depletion of tissue biotin<sup>7</sup> and other nutritional factors might possibly contribute to the localization of the virus. It is noteworthy, however,

that the whole phenomenon of malnutritional immunity can be explained without recourse to the conventional theories of sessile receptors and humoral antibodies

The evidence now available that prolonged fasting may be immunologically beneficial in certain virus infections if not accompanied by water deprivation is of particular practical importance under war conditions. The results of additional studies now in progress on the immunologic effect of altered water balance in other infectious processes will be awaited with great interest

### ESTROGENIC PRODUCTION OF MAMMARY CANCER

Lacassagne,<sup>1</sup> utilizing a strain of mice whose females developed breast carcinoma in high proportion, transplanted ovaries into previously castrated males on the supposition that mammary cancer did not develop in the males of the strain because of excessive atrophy of the mammary elements. Of 12 animals thus treated, none developed breast carcinoma at the end of one year. The same failure to produce cancer in this manner attended the experiments of Loeb of Cori and of Murray. Lacassagne injected weekly into mice 10 to 18 days old 0.05 cc of a solution in oil of 0.6 mg of crystalline estrone benzoate. All of the 3 males and 1 of the 2 females thus treated exhibited a typical mammary adenocarcinoma in from four to five months. This was apparently the first experimental production of mammary cancer in mice. Workers in this field were now confronted with the problem of determining whether the mechanism of estrogenic production of mammary carcinoma in mice was of a chemical nature or whether it simply furnished an anatomic substratum for animals of a strain with a hereditary predisposition to cancer. Lacassagne<sup>2</sup> submits the following evidence in favor of the cancerigenic mode of action of the hormones: (a) Cook and Dodds demonstrated estrogenic properties of certain carcinogenic hydrocarbons of molecular structure more or less related to that of the female hormone, (b) the normal rate of cancerization has been increased by estrogen injection to 60 per cent in both sexes, (c) cancers other than mammary have been observed and (d) Geschickter and Byrnes were able to obtain in a rat, in which mammary cancer is as rare as it is frequent in the mouse, by the action of estrogenic substances, a considerable number of mammary adenocarcinomas both in male and female rats of a selected strain in which, since 1934, no spontaneous cancer had been registered in a colony of 2,000 animals. Against the cancerigenic action of estrogenic substance, it was argued that (a) cutaneous epithelioma was never

produced by the repeated application of estrogenic substance, (b) it has been impossible to produce adenocarcinoma of mice in strains not subject to mammary carcinoma by estrogen injection and (c) certain synthetic estrogens such as diethylstilbestrol, while capable of producing carcinoma, only remotely resemble the sterols. Lacassagne concludes that cancer can occur only in a mammary gland which has undergone a certain degree of development and that the development of a mammary gland is dependent on the estrogenic and pituitary hormones, but whether these stimulating factors play a direct role in the cancerization process or produce the anatomic development of the mammary gland only sufficient to allow the cancer process to manifest itself is still undetermined.

Geschickter and Byrnes<sup>3</sup> report the occurrence of mammary cancers in 202 of 555 rats of an albino strain which were treated with estrogens. These animals have been maintained on a standard diet and inbred for seven years. Under these conditions spontaneous mammary cancer has not been observed in a colony of more than 5,000 animals. The essential feature of the estrogenic production of mammary carcinoma, according to these authors, is the acceleration or the prolongation of the ripening and maturity in the mammary gland beyond physiologic limits. If this condition is satisfied, carcinoma appears in the breasts of rats which are otherwise immune to the disease, whether these animals are young or old, males or females, castrates or noncastrates. Mammary carcinoma results in rats within a period of one hundred and twenty days when the amount of estradiol benzoate administered daily is from ten to fifteen times the physiologic dose. Geschickter and Byrnes advance two arguments in favor of the physiologic action of the estrogenic production of cancer. One is that carcinoma does not occur at the site of injection but appears instead in the organ which the hormone influences physiologically. The second is that the periods of time required to produce cancer with estrogens of varying chemical compositions are proportional to the physiologic potencies and independent of chemical formulas. Therefore, estrogens cannot be considered primarily from the point of view of chemical character as cancerigenic agents. The most potent estrogen will produce carcinoma in the shortest time. The total amount of estrogen necessary to produce carcinoma may be decreased to one half or to one third if the agent is implanted in the form of pellets rather than injected in oil.

These authors also found that if epithelial regeneration below the cancer producing level has been previously stimulated in the mammary gland it should be possible at some later date to produce cancer more

3 Geschickter Charles F and Byrnes Elizabeth W. Factors Influencing the Development and Time of Appearance of Mammary Cancer in the Rat in Response to Estrogen. *Arch Path* 33: 334 (March) 1942.

readily. In experiments in which preexisting changes in the breast resulting from previous estrogenic stimulation are combined with the effects of a final period of intense estrogenic stimulation, conditions found in the human breast with carcinoma are most closely approximated. These experiments, the author points out, suggest that human mammary cancer may result from one or from a combination of the following factors: (1) abnormally intense estrogenic stimulation during the adolescent period of mammary development or during a previous pregnancy, (2) ovarian dysfunction in cyclic women resulting in relative hyperestrogenism over a period of years prior to the menopause (most of these have the characteristic changes of adenosis or of Schimmelbusch's disease) and (3) intense or continuous estrogenic stimulation at the time of the menopause (superimposed on factors 1 and 2).

Estrogenic stimulation influences also other endocrine glands. The most striking changes were found in the pituitary gland and in the thymus. Hypophysectomy prevents the physiologic effects of estrogen on the mammary gland, and cancer does not develop. Geschickter and Byrnes point out the importance of species differences. They have not been able to produce breast carcinoma in monkeys and in rabbits. They found that administration of testosterone or progesterone simultaneously with or in sequence to estrogenic stimulation does not prevent the appearance of mammary cancer. The growth of estrogenic cancer, however, is inhibited by anterior pituitary extract. They conclude that the most important observation with respect to the estrogens is the production of mammary cancer by prolonged administration. This toxicologic property, they warn, must be considered when compounds of high potency with prolonged activity are administered.

### THE NATIONAL LEPROSARIUM

The origin of leprosy, which for centuries has been one of the most dreaded diseases, is lost in antiquity. Leprophobia is unjustified. While the disease is infectious it is not as contagious as tuberculosis, and the danger of exposure to leprosy is not great. A recent report by Faget<sup>1</sup> of the United States Public Health Service provides arresting information on leprosy as it exists in this country.

Constructive measures were first taken against leprosy in Louisiana in 1894, when a home on an old plantation was provided for 8 patients. The old slave shacks which were used to house the first patients were eventually abandoned and replaced with new buildings. In 1920 the federal government, cognizant of the occurrence of leprosy in many of the states of the Union

and recognizing the need for a home where all persons suffering with the disease might be cared for and treated, negotiated to take over the Louisiana Leper Home. At present the National Leprosarium (U. S. Marine Hospital) at Carville, La., is one of the most modern in the world. It is situated on a reservation of 350 acres and is actually a self-sustaining community. The presence of churches, a dairy, a power plant, a water treatment plant, a sewerage system, garbage disposal facilities, a fire department and laundries makes it indeed comparable to a small town. Any person afflicted with leprosy may present himself for care. Also admitted are lepers consigned to the hospital by the proper health authorities and persons apprehended under the authority of the United States quarantine acts. The majority of the patients are ambulatory and live in two story concrete buildings.

Occupational therapy has been found helpful, it has a good moral effect and prevents the brooding of a patient on his malady. Ample recreational facilities are also available. Many of the afflicted are employed by the government on a small salary basis, but the government provides all patients with food and clothing, together with books and sports equipment. The medical staff of the Leprosarium specializes in leprosy, and the medical library is adequate in this field. Besides general institutional care the patients are given any special treatment which may be thought beneficial to their condition. Practically all the patients take some form of treatment, and chaulmoogra oil products are extensively used.

Food plays a direct part in the fight against the disease. New experimental treatments have been investigated with selected patients, and the sulfonamides have proved effective in clearing up secondary infections and in healing chronic disabling ulcers. Whether or not some of the newer sulfonamide derivatives have any therapeutic action on leprosy, however, remains to be demonstrated. Large doses of thiamine have been found efficacious in relieving painful leprosy neuritis. In the laboratories of the Leprosarium research bearing on leprosy is carried out, and the institution also serves as a postgraduate instructional center for leprosy.

Since 1894 the Carville Hospital has cared for 1,371 patients, of whom 593 died at the hospital, 53 have been deported to foreign countries and 309 have been discharged with the disease arrested. Fifty-eight of the latter, however, have relapsed and returned to the hospital for further treatment. Of the total admissions about 400 were foreign born. Among the states from which patients were admitted Louisiana leads with 570, California follows with 194, Texas is third with 192 and New York is fourth with 118. Patients have been received from forty states.

<sup>1</sup> Faget, G. H. The Story of the National Leprosarium (U. S. Marine Hospital), Carville, Louisiana, Pub. Health Rep. 57: 641 (May 1) 1942.

## Current Comment

### FEDERAL AID FOR MEDICAL STUDENTS PURSUING ACCELERATED COURSES

The Congress has completed action on the proposal to provide federal financial aid to students pursuing accelerated courses in certain technical and professional fields considered essential in the national defense. The sum of \$5 000 000 has been made available for this purpose. Assistance will be given to students in such numbers as the chairman of the War Manpower Commission shall determine, to participate in accelerated programs in degree-granting colleges and universities in engineering physics chemistry medicine (including veterinary) dentistry and pharmacy whose technical or professional education can be completed within two years. Loans will be made to students who attain and continue to maintain satisfactory standards of scholarship who are in need of assistance who agree in writing to participate until otherwise directed, in the accelerated programs of study and who agree in writing to engage for the duration of the wars in which the United States is now engaged in such employment or service as may be assigned by officers or agencies designated by the chairman of the War Manpower Commission. Such loans are to be made by colleges or universities or public or college connected agencies from funds paid to them out of the federal appropriation. Loans will be made in amounts not exceeding tuition and fees plus \$25 a month and not exceeding a total of \$500 to any one student during any twelve month period. Indebtedness of students who, before completing their courses, are ordered into military service during the present wars under the Selective Training and Service Act of 1940, or who suffer total and permanent disability or death, will be canceled. The loan program will be administered in accordance with regulations promulgated by the Commissioner of Education with the approval of the chairman of the War Manpower Commission.

### NEW STANDARD NOMENCLATURE OF DISEASE AND OPERATIONS

In 1937 the headquarters of the American Medical Association undertook to edit and publish the Standard Classified Nomenclature of Disease. The third edition of this book is now available combined with a new Standard Nomenclature of Operations. Dr Edwin P. Jordan, one of the assistant editors of THE JOURNAL, has supervised the project. This edition of the Standard Nomenclature of Disease has been extensively revised under the direction of qualified specialists. Although the arrangement has not been changed substantially, about thirty-five hundred additions, deletions and corrections have been made in individual diagnostic entries, necessitating a new index designed to facilitate identification of preferred diagnostic terms. A special table of eponymic diseases has been added. More changes have been necessary in the fields in which research during the last few years has been most extensive, for example endocrinology and the vitamin deficiency diseases. The new Standard Nomenclature

of Operations which has been added under the same binding, has been prepared by a special committee consisting of Drs H. Perry Jenkins, T. R. Ponton and Bronson S. Ray, each of whom had compiled previous operative terminologies. The arrangement is similar to that followed by the Standard Nomenclature of Disease—it utilizes the same topographic designations and employs a simple and logical method of expressing the operative procedures. It is liberally indexed. Since the maintenance of hospital and institutional records is difficult because of the war, the adoption of this modern method of classification will help to stabilize this work. The desirability of introducing this up to date system in all government hospitals is especially apparent. No doubt the assistance of qualified and experienced medical record librarians could be obtained by government agencies to facilitate such action.

### SAFEGUARDING NARCOTIC DRUGS FROM THEFT

As a result of the foresight of the Federal Bureau of Narcotics in building up adequate reserves, immediate danger of a shortage in narcotic drugs does not threaten as far as legitimate use is concerned. The supply on hand, however, must be protected and conserved. None of the raw materials from which such drugs are produced are grown in the United States, sources of supply from overseas have either been cut off altogether by the war or are becoming more and more unproductive. The supply of smuggled narcotic drugs available to the illicit traffic has been practically eliminated by a gradual improvement in law enforcement. The trafficker who formerly distributed smuggled narcotics must now look elsewhere for his supply, and he is with accelerating frequency turning to the medicinal stocks. Legitimate holders of such stocks are being robbed and otherwise victimized to such an extent as to cause serious concern. Frequently thefts of narcotic drugs give evidence of having been perpetrated by gangs of professional thieves. For years the Bureau of Narcotics has been urging that stocks of such drugs be adequately protected from theft. Now it reemphasizes its previous appeals in this language:

The theft hazards to which such drugs are now subjected by reason of the marked shortage of smuggled drugs in the illicit traffic, the necessity for their conservation as critical and strategic war materials and the uncertainties of foreign shipping which may interfere with the procuring of replacement supplies all combine to make their proper safeguarding a matter of extreme importance. We have some reserve but not enough to be wasteful or careless. Every theft of narcotics, which must be replaced from this reserve, reduces by that amount the quantity of drugs available, not only for civilian medical needs, but also for the relief of pain in our armed forces and those of our allies.

Physicians, hospitals, druggists and other legitimate possessors of these drugs can minimize the danger by redoubling safeguards. Physicians should provide secure storage for their office supply of narcotics, they should lock their automobiles securely when narcotics are temporarily left in them. Thefts should be promptly reported to the narcotic district supervisor having jurisdiction.

# MEDICINE AND THE WAR

*In this section of The Journal each week will appear official notices by the Committee on Medical Preparedness of the American Medical Association, announcements by the Surgeon Generals of the Army, Navy and Public Health Service, and other governmental agencies dealing with medicine and the war, and such other information and announcements as will be useful to the medical profession*

## PROCUREMENT AND ASSIGNMENT SERVICE FOR PHYSICIANS, DENTISTS AND VETERINARIANS

### QUESTIONS AND ANSWERS ON PROCUREMENT AND ASSIGNMENT SERVICE

Q Will the Procurement and Assignment Service protect a doctor from the draft?

A The Procurement and Assignment Service was not established to protect anybody from anything. Its function is to enroll physicians, dentists and veterinarians and assign them to the positions in which their services will be of greatest value to the nation in the war emergency. This function obviously parallels the responsibilities of Selective Service, but the officials of the Selective Service have welcomed the cooperation of the Procurement and Assignment Service in dealing with these professional groups. To implement this cooperation, General Hershey issued a memorandum to Selective Service boards asking them to secure through the state director of Selective Service the recommendations of the Procurement and Assignment Service wherever they are considering the classification of a physician, dentist or veterinarian. Hence, if a doctor has enrolled with the Procurement and Assignment Service, his Selective Service board will be so advised and a recommendation for his deferment, until his services are needed in a professional capacity, will be made.

Q Will men under 45 be called before men over that age will be considered?

A The Army will consider applications for commission from men up to the age of 55 and the Navy up to the age of 50. The greatest need, however, is for younger men. Hence, the first call by the Procurement and Assignment Service will be for men under 36 and then men between 36 and 45 years of age.

Q If a physician is physically disqualified for a commission, is he still subject to the draft?

A The physical requirements for officers are higher than they are for enlisted men, but under the modified requirements for "limited service" in the Medical Corps most, if not all, physicians who meet the requirements for enlisted men will be eligible for commissions. If not, the physician concerned should consult the chairman of his State Procurement and Assignment Service Committee relative to service in a war industry or some other essential civilian service.

Q How much consideration will be given to the choices of service listed on the enrolment form of the Procurement and Assignment Service?

A So far as possible, the choices of service listed on the enrolment form will be given consideration. However, if the needs of the armed forces demand it, it may at times be necessary to ignore personal preferences.

Q Do physicians in shipbuilding and airplane factories receive any special consideration?

A Essential medical service in vital war industries must be maintained. To do this, certain medical positions must be declared essential. Individual physicians who are of military age and physically fit for service should be declared essential in such positions only if it is impossible to replace them or have the necessary service provided by men not otherwise available for service with the armed forces.

Q In determining the number of physicians needed to care for the civilian population, are rural communities considered on the same basis as larger cities?

A A special committee is now working on the determination of minimum quotas of physicians for civilian medical care. In their studies consideration will be given to the density of the population, the ease of transportation, the availability of hospital service and other factors.

Q Will doctors in draft age be called by the Procurement and Assignment Service on the basis of availability regardless of their Selective Service numbers?

A In asking physicians to accept assignments, the Procurement and Assignment Service will select names by chance from alphabetical lists of the names of the physicians in the age group desired. Officials of national headquarters of Selective Service report that it is impossible to use Selective Service order numbers for this purpose. The first lists to be given assignments with the Army or Navy will be those who have indicated these services as their first choice.

Q How many people in a community can be served by one man?

A Studies are in progress by a special committee of the Procurement and Assignment Service to serve as a basis for the determination of minimum quotas of medical service which should be retained for the civilian population. Until these studies are completed it has been agreed that, for general medical service, approximately one "effective" doctor to fifteen hundred population is the minimum coverage that should be provided. Limited specialists are not included in this basic figure.

Q Is it true that unless an intern for 1942-1943 has a commission in the Army or Navy he may be withdrawn at any time?

A National headquarters of Selective Service has advised local boards that medical students and interns who wish deferment and are physically enabled should apply for the commissions which are available to them. In view of this, interns who are physically fit and do not hold commissions may be subject to induction.

Q What percentage of a man's time devoted to medical teaching is necessary to make him essential?

A The determination as to whether an individual is an essential teacher cannot be put on a percentage basis. Some teachers on a full time basis cannot justifiably be considered essential, while others giving a much smaller proportion of time might be essential. In general, however, very special circumstances should exist to justify designating a physician of military age as an essential teacher unless he is devoting at least half time to teaching.

Q Is the local draft board or the Procurement and Assignment Service to determine whether a doctor is necessary to the local community?

A The legal responsibility for deciding whether an individual who is registered with Selective Service shall be given a deferment rests with his local Selective Service board. However, General Hershey has directed local boards, when considering the classification of physicians, dentists or veterinarians,

to secure the advice of the state committee of the Procurement and Assignment Service as to whether the individual under consideration is essential for the care of the civilian population in his community or whether he can be considered available for service elsewhere.

Q How many physicians are there in the United States under 35 years of age? Under 45?

A Of the 152,923 physicians in private practice in the continental United States,

75.3 or 24.7 per cent are under 35 years of age, 24.0 or 23.0 per cent are 35 to 44 years of age, 26.573 or 17.4 per cent are 45 to 54 years of age, 26.076 or 17.1 per cent are 55 to 64 years of age, 11.91 or 7.8 per cent are 65 to 74 years of age, 8.112 or 5.3 per cent are 75 to 84 years of age, and 7.2 or 4.7 per cent are 85 and over.

Q Do you expect the needs of the armed forces to be filled by voluntary enlistment? If not, what is to be the procedure?

A It is the firm conviction of the directing board of the Procurement and Assignment Service that the physicians of this country will willingly accept the assignments requested of them in meeting the medical needs of the nation during the war emergency. The executive order of the President establishing the Procurement and Assignment Service states that Mr. McNutt may instruct the Agency to draft legislation, which may be necessary to submit to the Congress providing for the involuntary recruitment of medical, dental and veterinary personnel, in the event the exigencies of the national emergency appear to require it. The directing board, however, has given no thought to such legislation because it is convinced that it will not be necessary.

Q In what grade may a doctor expect to receive a commission?

A The policy which is being followed by the Office of the Surgeon General of the Army in making recommendations for commission is as follows:

1 All appointments must be limited to the quotas provided for medical personnel of various ranks in relation to the total over-all size of the Army.

2 All appointments in tactical units will be at minimum grades of first lieutenant, as no experience in civilian life qualifies a doctor for service in this capacity.

3 Appointments above the minimum grade will be made only on the basis of vacancies, special qualifications and there being no one qualified to fill the position by a promotion.

*First Lieutenant*—All appointments under 37 will be in this rank except for individuals who possess special qualifications for a particular vacancy which exists. Certification by specialty board will be considered evidence of such special qualifications. Applicants who previously held appointments in the Medical Reserve Corps in the rank of captain may apply for reappointment at the same rank.

*Captain*—Initial appointees at the age of 37-45 may apply for this rank. Likewise, men under 37 with special qualifications.

*Major*—Age 37-55. Eligible applicants must have the special qualifications required for appointments as captain and in addition experience and training which qualifies the individual as chief of a service or section or executive of a large hospital.

*Lieutenant Colonel and Colonel*—New appointments will be made in these ranks only for special assignments which cannot be filled by promotion.

Signed for the Board,  
PROCUREMENT AND ASSIGNMENT SERVICE,  
FRANK H. LAHEY, M.D., Chairman

## HOW TO PROTECT ONESELF AGAINST GAS

This operations letter of June 9 of the Office of Civilian Defense, Washington, D.C., James M. Landis, director, deals with personal protection against gas. If people will remember a few simple facts, they will have no unreasonable fear of this agent.

War gases stay close to the ground, for they are heavier than air. To get out of a gassed area, simply walk against the wind or go upstairs.

Gas is irritating to the eyes, nose, lungs or the skin, but it is usually harmless if one does not become panicky but promptly leaves the gas area and cleanses oneself. A soldier must put on a mask where it is necessary to remain in the contaminated area, but a civilian can go up on the second or third floor and ignore it if the windows are kept closed.

If the gas should get on the skin, one can prevent it from doing much harm by sponging it off as quickly as possible with a piece of clothing such as a handkerchief and applying some neutralizing substance, followed by a thorough bath, preferably a shower, with common laundry soap and water.

If one is indoors, stay there with doors and windows closed, and go to the second or third story. Stay out of basements. Turn off the air conditioning, and stop up fireplaces and any other large openings.

Some gases are spread as oily droplets which blister and burn the skin and eyes. If one is outside when gas is used, do not look up. Use clothing or a handkerchief to blot drops of liquid from the skin and throw the contaminated cloth away. Do not rub as rubbing will spread the liquid. Then go to the nearest place where one can wash immediately with soap and water and cleanse oneself in the following manner:

Remove all outer clothing outside the house, since gas can be transmitted to others from contaminated clothing. Put it preferably in a covered garbage pail.

Apply one of the following effective household remedies to the part of the skin that has been contaminated: chlorox or similar household bleach (for mustard); hydrogen peroxide (for lewisite); paste or solution of baking soda if no peroxide or bleach is available. If one does not know the gas, use both peroxide and bleach. Keep bleach and peroxide out of the eyes. Do not waste time looking for these remedies; bathe immediately if they are not at hand.

After entering the house, wash the bleach or peroxide from the hands with laundry soap and water and then wash the face. Remove the underclothing, place it in a covered garbage pail and enter the bathroom.

Irrigate the eyes with large amounts of lukewarm 2 per cent solution of baking soda (1 tablespoon to a quart of water) or else with plain water. Use an ordinary irrigating douche bag or an eye irrigator. If one does not have these, let plain warm water pour into the eyes from the shower, washing them thoroughly. Do not press or rub the eyes.

Lastly, take a shower using laundry soap and hot water.

If the nose and throat feel irritated, wash them out also with baking soda solution.

If the chest feels heavy and oppressed, if one has any trouble breathing or if cigaret smoke becomes distasteful, lie down and stay perfectly still until a doctor comes.

If blisters develop, do not break them, and call a doctor.

Remember

Soldiers require gas masks because they must remain in the contaminated area. Civilians can get out of the gassed area or get above the level of the gas, where they do not need gas masks or protective clothing.

Injured persons who are gassed require decontamination before they can be admitted to hospitals. All other civilians can best prevent any serious injury by promptly helping themselves in the manner outlined, using a kitchen or bathroom, laundry soap and water, and a few materials found in every household.

## HANDBOOK FOR PHYSICIANS ON INDUSTRIAL HEALTH AND MEDICINE IN WAR INDUSTRIES

On the recommendation of the Committee on Industrial Medicine of the National Research Council, the Division of Industrial Hygiene, National Institute of Health, is preparing a manual on Industrial Hygiene and Medical Service in the War Industries. The publication is intended for wide distribution among industrial physicians and the general medical profession. The recommendation of the National Research Council was endorsed by the Health and Medical Committee and has been approved by Federal Security Administrator Paul V. McNutt and Surgeon General Thomas Parran of the U.S. Public Health Service.

The resolution submitted by the Committee on Industrial Medicine, Division of Medical Sciences, National Research Council, follows

The change over of industry to the manufacture of war materials is resulting in modifications of occupational health hazards, the introduction of new occupational disease exposures and certain variations in the industrial medical procedures. The following are illustrative

1 There is increased usage of cutting oils, compounds and chemicals, many of which are capable of causing the industrial dermatoses

2 Grinding operations have multiplied, and these entail exposures to aluminum oxide, silicon carbide and other grinding materials. While the dusts from grinding operations have not been regarded as harmful to health, disabilities occurring in workers so exposed are coming to be regarded as compensable

3 Shot blast operations are being replaced by sand blasting, and new installations of this nature are consistently using sand

4 In an effort to speed up pickling operations, there is a tendency to increase the concentrations of acids in the pickling tanks, with consequently more contamination of the air with fine droplets of the acids

5 Solvents are being more widely used, and certain of the newer ones are purported to be nontoxic. As most of them are in the chlorinated hydrocarbon group of chemicals, they can be assumed to be more or less toxic

6 Paint spraying operations are being modified, requiring radical readjustments in ventilation procedures

7 There is a tendency toward longer working hours and, consequently, longer hours of exposure to harmful materials and shorter periods of recuperation

8 It is becoming more and more necessary to employ women, older men and young men who are not eligible for military service, many of whom require selective placement, which is a function of the plant medical service

9 It is necessary that the medical service in the war industries be integrated with the emergency medical service of civilian defense. Details necessary to this objective are not understood by the industrial physicians as yet

In order that industrial physicians and the general medical profession, when called on by industry, may be more adequately prepared to protect the health of the workers in the war industries, be it therefore

*Resolved* That the Committee on Industrial Medicine of the National Research Council recommends the preparation of a brochure or special article on "Industrial Hygiene and Medical Service in the War Industries" for wide distribution among the medical profession, and that this brochure be prepared by the Division of Industrial Hygiene, National Institute of Health of the U. S. Public Health Service

The brochure will be prepared by the full time and consultant professional staff of the Division of Industrial Hygiene under the general editorship of Dr. William M. Gafafer, chief of the statistical unit of the division. Important subjects for discussion include toxicity and potential dangers of organic and inorganic substances in the war industries, occupational skin diseases in war industries, engineering control, industrial medical service, nursing in industry, dental services, fatigue, women in industry, medical control of respiratory diseases, nutrition in war industries, available governmental industrial hygiene services and integration of plant and community emergency medical services. The brochure will probably cover about three hundred pages

### ILLINOIS CONFERENCE ON NUTRITION FOR DEFENSE

The Illinois Nutrition Committee and the Nutrition Division of the Illinois Defense Council sponsored a conference on nutrition, which was held at Springfield June 19-20. Lydia J. Roberts, Ph.D., chairman of the Illinois Nutrition Committee and of the Department of Home Economics of the University of Chicago, presided at the opening session and gave an address entitled "How Is Illinois Equipped and Organized to Meet Its Nutrition Problems?" Dr. Roberts is a member of the Council on Foods and Nutrition of the American Medical Association.

Dr. Clifford Grulce, head of the pediatrics department of Rush Medical College, and Dr. M. H. Kronenberg of the Illinois Department of Public Health, among others, took part in a symposium on "What Is Our Nutrition Problem in Illinois?"

Helen Walsh, regional nutritionist of the Office of Civilian Defense, Health and Welfare Services, Washington, D. C., discussed "Highlights from the National Nutrition Program." Dr. Frank G. Boudreau, director of the Milbank Memorial Fund and chairman of the Food and Nutrition Board of the National Research Council, discussed "Nutritional Problems in Wartime, with Special Consideration of the Nutritional Problems of Industrial Workers."

Symposiums were participated in by numerous authorities in the fields of nutrition and home economics, the general subject being "Ways and Means of Carrying on Nutrition Activities at the State and Local Levels."

"Nutrition movies" were shown. A collection of materials helpful in developing nutritional programs was exhibited.

### SPECIAL CLASS FOR STUDENT NURSES

A special class of nursing students organized in the schools of nursing of the Department of Hospitals of New York City, comprising one hundred pre-nursing students of the department of hospitals, was admitted to Brooklyn College on June 29. These students will have two months' preclinical science work at the college and then be admitted to Bellevue, Harlem, Kings County and Metropolitan hospitals in September to continue the nursing program. This arrangement is made possible by a grant under the federal security agency appropriation act of 1942, which provides funds for the expansion of the approved schools of nursing throughout the country. Brooklyn College has cooperated by assigning teachers and laboratories for the teaching of these students during the summer months. Although the basic course in nursing is three years, the opportunity to serve begins almost at once. As the student nurse learns to care for the patients, this helps relieve the time of graduate nurses for duties requiring greater experience. Hundreds of the most experienced graduate nurses are being called to serve with the military forces, thus causing a shortage of nurses for civilian work.

### AMBULANCES PRESENTED TO BROOKLYN CHAPTER OF THE RED CROSS

At a ceremony attended by thousands of persons at the Brooklyn Borough Hall, June 19, several ambulances and four mobile canteens were presented to the Brooklyn chapter of the American Red Cross. The ambulances were presented by the Kings County Medical Society, the Brooklyn Boys' High School, Abraham Lincoln High School, Midwood High School, Franklin K. Lane High School, Samuel J. Tilden High School and the Brooklyn Heights Association. The mobile canteens were the gifts of the Masons of Greater New York, the Bush Terminal Merchants' Association, the Loyal League and the Brooklyn Girls' High School. The Borough President, John Cashmore, the acting secretary of the department of health, Dr. Frank A. Calderone, and others gave addresses. Eighteen sailors of the U. S. S. *Marblehead*, which recently returned to the United States after having been disabled in the battle of the Java Sea, received an ovation.

### MEDICAL AND SAFETY DIRECTORS' CONFERENCE

Physicians and engineers in ordnance plants will meet in a series of special conferences to discuss and clarify industrial hygiene problems of common concern in government establishments. The first conference is scheduled for July 17-18 in St. Louis and will be attended by personnel from plants within a 300 mile radius of that city. The conferences are sponsored by the Office of the Chief of Ordnance, War Department, in cooperation with the Division of Industrial Hygiene, National Institute of Health, and the Surgeon General's Office of the Army. Three papers will be presented at each of six sessions, allowing time for full discussion. The speakers will include representatives of the aforementioned agencies and of the Office of the Surgeon General, War Department, the E. I. du Pont de Nemours Company, the General Motors Corporation and the U. S. Bureau of Mines, Department of the Interior.

### OFFICERS OF THE ARMY

An officer of the Army of the United States must be at the time of appointment a citizen of the United States or the Philippine Islands, or an alien of a co-belligerent or friendly country who otherwise possesses the same qualifications as a citizen of the United States, and between the ages of 18 and 60 years, according to War Department Circular No. 147, section 6a, dated May 16, 1942.

# ORGANIZATION SECTION

## OFFICIAL NOTES

### ABSTRACTS OF MINUTES OF MEETINGS OF BOARD OF TRUSTEES HELD IN ATLANTIC CITY N J, JUNE 7-11, 1942

A full day meeting of the Board was held on Sunday, June 7, and meetings of shorter duration were held on other days during the week of the annual session.

#### EMPLOYMENT OF INVESTMENT COUNSEL

The Board approved the employment by the Finance Committee of investment counsel to advise regarding the investment of the funds of the Association.

#### OMISSIONS FROM AMERICAN MEDICAL DIRECTORY

It was decided that beginning with the edition now in press, the American Medical Directory shall include only the names of those who are graduates of medical schools with the degree of Doctor of Medicine or its equivalent and of those who are holders of license under the provision of years of practice of medicine or of those not otherwise specified whose names have appeared in previous editions of the Directory, and that the subtitle of the Directory so indicate.

#### WAR MEDICINE

Authorization was given for the reconstitution of the Editorial Board of *War Medicine*. Beginning with the July issue the Board will be constituted as follows: Drs. Morris Fishbein, Chief Editor; Eugene F. Du Bois, Perrin H. Long, W. W. Palmer, Clarence D. Selby, O. H. Perry, Pepper Winfred Overholser, Walter B. Cannon, Frederick A. Collier and Milton C. Winternitz in cooperation with C. C. Hillman, Brigadier General, U. S. Army Medical Corps, Charles S. Stephenson, Captain, U. S. Navy Medical Corps, and R. R. Spencer, U. S. Public Health Service. The statement that the periodical is published under the auspices of the American Medical Association and the Committee on Information, Division of Medical Sciences, National Research Council, with the names of the members of that committee will be continued.

#### APPOINTMENTS

Dr. C. S. Keefer, Boston, was elected to succeed Dr. Soma Weiss on the Council on Pharmacy and Chemistry.

The Board approved the appointment of Dr. Paul A. O'Leary to represent the American Medical Association at the meeting of the Canadian Medical Association at Jasper National Park, June 15 to 19, 1942.

#### MEDICOPHARMACEUTICAL RELATIONSHIPS

Authorization was given for continuation of negotiations between the Council on Pharmacy and Chemistry and the American Pharmaceutical Association with a view to holding another conference on medicopharmaceutical relationships when the time appears propitious.

#### ASSOCIATION BROADCAST

Continuation in the fall of the Association's broadcasting program under the title *Doctors at War*, was authorized by the Board provided conditions are as favorable at that time as they have been during the season just completed.

The Board approved a resolution expressing appreciation to the National Broadcasting Company, the Columbia Broadcasting System, the Blue Network and numerous individual radio stations which have from time to time during the past year participated with the American Medical Association or, on request of the Association, with related medical and health agencies in health education broadcasting, and referred the resolution to the House of Delegates.

#### SERVICES OF COMMITTEE ON AMERICAN HEALTH RESORTS OFFERED TO GOVERNMENT

A resolution received from the Committee on American Health Resorts offering its services as a whole or as individual, to the Surgeon General of the Army, the Navy and the Public Health Service, to the Health and Medical Welfare Division of the Federal Security Agency and to the Director of the Veterans' Bureau to assist in every possible way in effecting a plan whereby the facilities of the American Health Resorts of the United States can be utilized for the care and treatment of properly selected patients who would benefit from such service was approved by the Board.

#### HYGIEA

Approval was given for certain changes in the format for *Hygiea*, which necessitate the employment of a new art editor.

#### NATIONWIDE EXCHANGE OF INFORMATION ON PROGRESS IN MEDICAL SCIENCE

Authorization was given to Dr. Morris Fishbein, Editor, to prepare a biweekly letter on the advancement of medical science, which will be sent, through the Department of State, to the allied nations with a view to keeping them informed of the progress being made in the United States.

#### APPOINTMENT OF OFFICERS AND COMMITTEES

Dr. Roger I. Lee was elected Chairman of the Board for the ensuing year. Dr. R. L. Sensenich, Vice Chairman, and Dr. E. E. Irons, Secretary.

Drs. James R. Bloss (Chairman), R. L. Sensenich and E. E. Irons were elected to act as the Executive Committee and the Finance Committee.

#### MISCELLANEOUS

Numerous other matters were considered by the Board at its several meetings, some of which will be reported on later.

## MEDICAL LEGISLATION

### MEDICAL BILLS IN CONGRESS

*Changes in Status*—H. R. 7181 has been approved by the President, making appropriations for the Department of Labor, the Federal Security Agency and related independent agencies for the fiscal year ending June 30, 1943. The bill includes an appropriation of \$5,000,000 to assist students in such numbers as the chairman of the War Manpower Commission shall determine who participate in accelerated programs in degree-granting colleges and universities in engineering, physics, chemistry, medicine (including veterinary), dentistry and pharmacy and whose technical or professional education can be completed

within two years. This loan program will be administered through the Office of Education. H. R. 7242 has passed the House providing that in time of war or national emergency any officer of the Medical Administrative Corps commissioned in the Army of the United States or any component thereof may be appointed by the President to higher temporary grade not above the grade of colonel without vacating any appointment held by him at the time of such temporary appointment. The House Committee on the Judiciary has ordered favorably reported the Tolson bill H. R. 1052 to authorize chiropractors to treat the beneficiaries of the United States Employees Compensation Act.

## Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST SUCH AS RELATE TO SOCIETY ACTIVITIES, NEW HOSPITALS, EDUCATION AND PUBLIC HEALTH)

### ARIZONA

**State Medical Election**—Dr Otto E Utzinger, Ray, was unanimously chosen president-elect of the Arizona State Medical Association at its annual meeting in Prescott, May 25-29. Dr E Payne Palmer, Phoenix, was installed as president. Dr Virgil G Pierson, Tucson, was chosen vice president, Dr Clarence E Yount, Prescott, reelected treasurer and Dr William Warner Watkins, Phoenix, reelected secretary. The 1943 meeting will be in Tucson.

**Encephalitis Survey in Pinal County**—A field investigation of encephalitis is being conducted in Pinal County by Dr William McD Hammon of the George Williams Hooper Foundation, University of California, San Francisco, and Dr Gordon Meiklejohn and Mr Bernard Brookman, entomologist, both of the University of California at Berkeley. The state department of health and the Agricultural Welfare Association are cooperating with the hospital in Casa Grande, where the field headquarters has been established. According to *Public Health News* there were at least 18 cases of human encephalitis in Pinal County last year. The St Louis type predominated. Dr Hammon and associates have been studying outbreaks of encephalitis in man and horses in some western states for the past two years and found what appears to be a vast reservoir for infection of mosquitoes in barnyard animals. In the Arizona study material taken from mosquitoes and other insects, domestic animals and some wild animals will be sent to the Hooper Foundation laboratories in San Francisco to determine the presence of virus.

### ARKANSAS

**District Meetings**—The Ninth Councilor District Medical Society met at the Hotel Seville, Harrison, June 3. The speakers included Drs Rufus B Robins, Camden, "Human Element in Medicine", Silas C Fulmer, Little Rock, "Clinical Syndrome in Coronary Diseases", Joseph F Shuffield, Little Rock, "Fractures of the Ankle", Grady W Reagan, Little Rock, "Diagnosis and Treatment of Urinary Calculus," and William R Brooksher, Fort Smith, secretary of the state medical society. The Arkansas State Pediatric Society was addressed recently in Hot Springs National Park by Drs Gilbert J Levy, Memphis, on "Use of Sulfonamides in the Treatment of Gonorrheal Conjunctivitis", Paul L Mahoney and Alan G Cazort, Little Rock, "The Relationship Between the Pediatrician, the Otolaryngologist and the Allergist" and William V Newman, Little Rock, "The Orthopedic Treatment of Poliomyelitis". The Fourth Councilor District Medical Society meeting in McGehee, May 19, was addressed, among others, by Dr Rufus B Robins, Camden, on "The Acute Conditions of the Abdomen".

### CALIFORNIA

**Anatomists Honored**—Charles H Danforth, Ph D, professor of anatomy at Stanford University, has been elected president of the Western Society of Naturalists, and Frank M MacFarland, Ph D, emeritus professor of histology at Stanford, has become the president of the California Academy of Sciences.

**Dr Magan Retires as President of Medical College**—Dr Percy T Magan, since 1928 president and professor of medical ethics at the College of Medical Evangelists, Los Angeles, was guest of honor at a reception in Los Angeles, May 13, held by students, alumni and friends to mark his retirement as president of the college. Dr Magan, who graduated at the University of Tennessee College of Medicine, Memphis, in 1914, was dean and professor of medicine at the College of Medical Evangelists from 1913 to 1928. He is a former vice president of the California Medical Association. Dr Walter E Macpherson, Los Angeles, professor of internal medicine and physiology at the College of Medical Evangelists, has been named president to succeed Dr Magan.

### FLORIDA

**Personal**—Dr Rolla J Shale, Ontonagon, director of the Ontonagon-Baraga district health department in the state of Michigan, has been appointed director of the Hillsborough County health unit with headquarters in Tampa.

**Special Society Election**—Dr Shaler A Richardson, Jacksonville, was chosen president of the Florida Society of Ophthalmology and Otolaryngology at its recent annual meeting in Hollywood. Other officers are Drs Robert E Repass, Miami Beach, vice president, and Carl E Dunaway, Miami, secretary.

**Annual Tuberculosis Conference**—The Florida Tuberculosis and Health Association held its annual tuberculosis conference in Tampa, May 18-19. Among the speakers were Dr Esmond R Long, Philadelphia, Dr Alexandre Bruno, Paris, France, former director of the Rockefeller Foundation Commission in France, Dr Warren W Quillian, Coral Gables, and Mr Frank Kiernan, director of the New York City Tuberculosis and Health Association.

### IDAHO

**Personal**—Dr Paul R Ensign, Boise, has been named director of the health unit in Boise, succeeding Dr Gustavus D Bock, who resigned to join the U S Naval Medical Corps.

**Society News**—The Pocatello Medical Society was addressed recently by Dr Paul M Ellis, Wallace, president of the state medical association. At a meeting of the South Side Medical Society on May 13 in Twin Falls the speakers were Drs Fern M Cole, Caldwell, on "Procurement and Supply", James L S Stewart, Boise, "Gastric Surgery," and Sydney E Sinclair, San Francisco, who is touring the state under the auspices of the state health department.

### ILLINOIS

**Election of Bacteriologists**—Dr Josiah J Moore, Chicago, was elected president of the Society of Illinois Bacteriologists at its spring meeting on May 8 in Chicago and Dr Henry Close Hesseltine, Chicago, vice president. Mrs Harry B Harding, Chicago, was reelected secretary-treasurer. The next meeting will be held in the fall of 1947.

**New Deputy Health Commissioner**—Dr Hugo V Hullerman, Springfield, chief of the division of local health administration, state department of public health, has resigned to become deputy commissioner of health and director of maternal child health of the Peoria State Department of Health, effective July 1. He succeeds Dr John A Carswell, formerly of Milwaukee, who has held the position since February 1 and is resigning on account of ill health. Dr Carswell has accepted a position as health officer of Santa Barbara County in California. Dr Hullerman has held his position in the state health department for the past three years.

### LOUISIANA

**Special Society Elections**—Dr Earl Conway Smith, New Orleans, was elected president of the Louisiana Gynecological and Obstetrical Society at its recent annual meeting, Dr Clifford R Mays, Shreveport, vice president, and Dr Eugene H Countiss, New Orleans, secretary. Dr Chester A Stewart, New Orleans, was named president-elect of the Louisiana State Pediatric Society at its recent annual meeting, and Dr Stanley George Wolfe, Shreveport, was installed as president. Dr William C Rivenbark, New Orleans, is secretary. New officers of the Association of Louisiana Pathologists, chosen at its recent annual session, are Drs Maurice J Couret, president, Albert E Casey, vice president, and Samuel H Colvin Jr, secretary-treasurer, all are of New Orleans. The Louisiana Coroners' Association recently elected the following officers: Drs Charles J Barker, Thibodaux, president, Robert F De Rouen, New Iberia, and Marvin M Odom, Grambling, presidents, and Luther L Ricks, Independence, secretary-treasurer.

### MAINE

**Fifty Year Medals Awarded**—The Maine Medical Association presented fifty year medals to the following during its recent annual meeting in Poland Spring:

Dr James P Blake Harrison  
Dr Edward F Robinson Falmouth  
Dr Owen Smith, Portland  
Dr Frederick E Wheat Westboro  
Dr Verdel O White E Dixfield

Dr Luther G Bunker W  
Dr Clayton H Bayard  
Dr Ralph H Marsh  
Dr Eugene L Stevens

**Society News**—At a recent meeting of the Portland Medical Club, Drs Elton R Blaisdell and Langdon T Thaxter, Portland spoke on "Acute Low Substernal and High Epigastric Pain (Possible Errors in Differential Diagnosis)". The Penobscot County Medical Association held a meeting on April 21 at Bangor. The subject for the evening was "Medical Aspects of War Services". A joint meeting of the Somerset Franklin and Kennebec county medical societies, April 23, Waterville was addressed by Drs Richard P Lane, Skowhegan in "Meningococci Menstritis", Thomas Dennis Pratt, Brookline Mass., "Cerebellar Tumor in a Child of Twelve Years", George L Pratt Farmington, "Ulcerative Colitis," and Delmer Allan Crug, Bangor.

#### MICHIGAN

**Medical Coordinator in Wayne County**—Dr Roland M Athas, Detroit, was appointed medical coordinator for the Wayne County Department of Social Welfare on May 26. Dr Athas graduated at Northwestern University Medical School in 1915 and entered the practice of medicine in Detroit in 1919. He has been active in the Wayne County Medical Society.

**Practice of Medicine in Total War**—The Michigan State Medical Society will present an institute on the "Practice of Medicine in Total War" during its annual meeting in Grand Rapids in September. The following subjects will be covered: How England Retorted to a War Brought Home, Nutritional Problems in Wartime Civilian Morale in Time of War, the Modern Treatment of Civilian Injuries Incident to Warfare and the Infectious Disease Problem in Wartime.

**Industrial Hygiene Survey**—The bureau of industrial hygiene of the Michigan Department of Health recently completed a study of industrial plants in Hillsdale County to determine industrial growth. In Hillsdale County which is typical of the state counties which are not predominantly industrial but which are experiencing an increase of industry devoted to war needs, the study showed that plant employment had increased over 60 per cent during the last year at an estimated 2300 plus. A 25 per cent gain in the number of industries has been recorded during the last three years. Activities of the bureau of industrial hygiene are directed at controlling the environmental influences which affect the physical and mental health of the worker, the placing of workers at tasks for which they are physically equipped, the maintaining of physical and mental fitness of workers after they are placed in jobs and the reducing of the amount of productive time and wages lost because of sickness or accident, whether due to occupational or to nonoccupational causes. A release from the state department of health stated that 65 per cent of Michigan's industrial workers and 63 per cent of the state's industrial plants are located outside Detroit.

#### MINNESOTA

**Lecture on Genetics**—The first lecture under the auspices of the newly organized Charles Fremont Dight Institute for the Promotion of Human Genetics now in operation on the University of Minnesota campus, Minneapolis, was delivered recently by Dr Philip Levine Newark, N J, on "Serological Differentiations of Human Blood".

**Ophthalmologists Elect Officers**—Dr Louis A Nelson, St Paul, was recently elected president of the Minnesota Academy of Ophthalmology and Otolaryngology. Other officers include Drs Charles Wilbur Rucker, Rochester, and Edward D Risser, Winona, vice presidents, and William A Kennedy, St Paul, secretary-treasurer.

#### MISSISSIPPI

**Dr Hickerson Goes to Cincinnati**—Dr William D Hickerson Sanatorium has resigned as supervisor of the field tuberculosis diagnostic unit for the Mississippi State Board of Health, effective June 1, to become superintendent of the Cincinnati Sanatorium Cincinnati. His wife Dr Virginia B P Hickerson, a member of the staff of the Mississippi State Tuberculosis Sanatorium Sanatorium also resigned to accept a position as resident physician at the Cincinnati Sanatorium.

#### NEW HAMPSHIRE

**Memorial Mayo Lecture at Dartmouth**—The annual W J and C H Mayo Memorial Lectureship in the field of medicine and surgery has been established at Dartmouth College Hanover by Dr and Mrs Waltham Walters Rochester Minn. Dr Walters a Dartmouth graduate of 1917 gave the administration of the lectureship to the Dartmouth Medical School. The memorial was established there as a stimulating factor in interesting men in medicine and surgery, particularly to call attention to the accomplishments of Drs W J and C H Mayo in these fields.

#### NEW JERSEY

**Physician Accused of Altering Fingerprints of Fugitive**—The Newark *News* reported on June 9 that Dr Leopold W A Brandenburg, Union City, was arrested by F B I agents for operating on a fugitive from justice to destroy his fingerprints and conceal his identity. Others arrested in connection with the case, according to the *News*, are Dr Howard A Weleher, North Bergen, president of the Union City General Hospital Association, Henry Manick, houseman and chauffeur for Dr Brandenburg, Union City, Cyrus La Zerdura, Harrington Park, and Robert Everette, Surf City. The arrests were announced simultaneously by J Edgar Hoover, director of the Federal Bureau of Investigation, Washington, and E E Conroy, acting assistant director in Newark. Dr Brandenburg is charged with misprision (guilty knowledge) of a felony, but Mr Conroy is said to have announced that he would be prosecuted for the operation, it was reported. Roscoe J Pitts, Charlotte, N C, who has a long prison record, was the subject of the operation in which Dr Brandenburg was alleged to have grafted flesh from Pitts's side on his fingertips. The *News* stated that Dr Brandenburg was fined in 1933 for illegal sale of narcotics and convicted in 1934 of complicity in a \$100,000 mail robbery in North Carolina. That conviction was later reversed. He has been arrested under state law for illegal operations but has never been convicted, the *News* reported.

#### NEW YORK

**Typhoid Carriers Decrease**—In 1941 for the first time since the practice of requiring release cultures for cases of typhoid was initiated by the state department of health, an actual decrease in the number of typhoid carriers was reported as compared with the total for the previous year. According to *Health News* a total of 431 carriers, exclusive of those in state institutions, was under supervision in upstate New York at the close of 1941. Thirty-two new carriers were added to and 33 were removed from the register during the year. Twenty-three were discovered as a result of epidemiologic investigation of sporadic cases of typhoid, 1 by means of release cultures, 1 on the basis of information furnished by the New York City Department of Health, and 5 were discovered accidentally—1 at the time of cholecystectomy, 2 through drainage of the gallbladder, 1 because of drainage of an abscess in the region of the gallbladder and 1 through hospitalization for observation. Two previously discovered carriers, who had been living temporarily out of the state, were added to the register. Of the 35 carriers whose names were removed from the register, 23 died. Five carriers were released from restrictions, 4 following cholecystectomy with subsequent submissions of the required number of negative fecal and duodenal specimens. The remaining 7 carriers were removed because of change of residence to a community outside the jurisdiction of the department.

#### New York City

**Grant for Work on Fluorescein**—The John and Mary R Markle Foundation has given a grant of \$3400 to New York Medical College, Flower and Fifth Avenue hospitals for further research in the use of fluorescein as a means of measuring the adequacy of blood supply in various parts of the body and will make possible further research in the speed of circulation in various types of heart disease.

**Friday Afternoon Lectures**—"The Care of the Civilian Population in War Time" will be the theme of the fall series of Friday afternoon lectures under the auspices of the Medical Society of the County of Kings. Tentatively, individual topics have been selected as follows: Burns, Shock and Hemorrhage, Emergency Treatment and Transportation of Fractures, Emergency Care of Pregnant Women, Cardiac Emergencies During War Time, Pediatric Emergencies, War Neuroses, War Nutrition, Emergency Therapeutics and Intracranial Emergencies.

**Dr Healy Receives Janeway Medal**—Dr William P Healy was presented with the Janeway Medal of the American Radium Society during its annual meeting in Atlantic City, June 8. He had delivered the Janeway Lecture on "The Role of the Gynecologist in the Field of Cancer" and was given the prize for outstanding contributions in the field of radium therapy. Dr Healy graduated at Johns Hopkins University School of Medicine Baltimore in 1900 and is a member of the American Gynecological Society, American College of Radiology and the American Radium Society.

**The Care of Children with Heart Disease**—In a report recently issued by the city board of education, the creation of a medical advisory committee to direct the medical supervisory and educational aspects of the care of cardiac children is recommended. The report indicates that existing facilities and accommodations are inadequate. Results were based on a limited study of sixty-eight cardiac classes; supplementary data furnished by forty-four principals of schools having these classes and information on cardiac children in nineteen schools without cardiac classes. The report points out that no evidence has been produced to justify present classes in the city but recommends their continuance until some working program has been developed to afford proper medical supervision of cardiac children. Of an estimated group of 7,000 cardiac children, only about 2,000 are in specially segregated classes. The report recommends that when rheumatic fever is found in a child examinations of siblings of the parents should be made, that daily examinations of cardiac children be made at school to determine whether they are in good health and free from infection of the upper respiratory tract before entering classes, subsequent care to be determined on their condition, that two medical examinations a year be given to these children, that home teachers be provided for those children whose cardiac condition prevents them from attending regular classes, that teachers with acute infections of the upper respiratory tract should not, during the first three days of their illness, come in contact with cardiac children and that a register be kept of all children with rheumatic fever, chorea and rheumatic heart disease.

### OHIO

**Health Commissioner Joins the Navy**—Dr John L. Lavan, health commissioner of Toledo, has been granted a leave of absence to accept active duty as commander in the medical corps of the U S Navy. Dr Lavan is stationed along the east coast.

**Assistant Professor Goes to Searle & Company**—Walter E. Hanbourger, Ph.D., assistant professor of pharmacology at Western Reserve University School of Medicine, Cleveland, has been appointed pharmacologist for G. D. Searle & Company, Skokie, Ill. Dr Hanbourger received his degree of doctor of philosophy at Western Reserve in 1931. He served as an instructor in pharmacology and toxicology at Yale University from 1932 to 1936, when he returned to Western Reserve.

**Public Health Officers**—Dr James F. Wilson, Washington, C. H., was named president-elect of the Ohio Federation of Public Health Officials at its annual meeting in Columbus, May 20, and Dr John J. Sutter, Wooster, was installed as president. Dr Willoughby D. Bishop, Greenville, was reelected secretary-treasurer. Dr Henry Kennon Dunham, Cincinnati, president, and all other officers of the Ohio Public Health Association were reelected at the annual meeting of the group on May 21 in Columbus.

### PENNSYLVANIA

**Third and Twelfth Districts in Joint Meeting**—A joint meeting of the Third and Twelfth councilor districts of the state medical society was held in Sayre on June 24. The program opened with a surgical clinic at the Robert Packer Hospital, Sayre, conducted by Dr Donald Guthrie, Sayre, and associates. Among the speakers on the program were:

- Dr Paul H. Harmon, Fresno, Calif., Surgical Treatment of Osteoarthritis of Hip Joint
- Dr Frederic W. Bineroft, New York, Treatment of Acute Dermatitis
- Dr Abraham H. Aaron, Buffalo, Important Medical Measures in the Management of Gastrointestinal Diseases
- Dr William L. Estes, Bethlehem, Present Problems of Procurement and Assignment
- Major Gerald N. Fluegel, M. C., U S Army, Philadelphia, The Physician in War Time
- Dr Lewis T. Buckman, Wilkes Barre, Round Up of State Society Activities
- Dr Robert L. Anderson, Pittsburgh, Postgraduate Opportunities
- Dr Chauncey L. Palmer, Pittsburgh, Health Legislative Problems

Following a luncheon, fifty year testimonial certificates were presented to Drs William E. Keller, Scranton, David H. Ludlow, Easton, Walter M. Reedy, Dalton, and John G. Wilson, Factoryville.

### Philadelphia

**Chief Physician of Harvard Unit in England**—Dr Alexander J. Steigman, member of the staff of the University of Pennsylvania School of Medicine, has been appointed chief physician to the American Red Cross Harvard Field Hospital Unit in England. He was also given a concurrent appointment of instructor in pediatrics and preventive medicine in the Harvard Medical School, Boston. Dr Steigman graduated at

Temple University School of Medicine in 1938. In May 1941 he went to England as a member of the Red Cross Harvard Hospital Unit, where he has been working in the prevention and control of infectious diseases, operating a mobile team from the one hundred and twenty-five bed hospital base somewhere in England.

**Faculty Changes at Jefferson**—Included among the recent changes at Jefferson Medical College of Philadelphia are:

- Dr Robert A. Reimann, appointed acting head of the department of experimental medicine
- Dr Baldwin L. Keyes, professor of psychiatry
- Dr Martin E. Rehfuss, Sutherland M. Prevost, lecturer in therapeutics in the department of medicine
- Dr Clifford B. Lull, clinical professor of medicine
- Dr Garfield G. Duncan, clinical professor of medicine
- Dr William J. Harrison, associate professor of ophthalmology
- Dr David R. Morgan, associate professor of pathology
- Dr Robert A. Matthews, associate professor of psychiatry
- Dr William H. Schmidt, associate professor of physical therapy
- Dr Mario A. Castallo, assistant professor of obstetrics
- Dr Arthur First, assistant professor of obstetrics
- Dr Robert A. Groff, assistant professor of neurosurgery
- Dr Reynold S. Griffith, assistant professor of medicine

### RHODE ISLAND

**State Medical Election**—Dr Charles F. Gornly, Providence, was elected president of the Rhode Island Medical Society at its annual meeting, May 21. Drs Murray S. Dunforth, Providence, and Elihu S. Wing, Providence, are vice presidents and Dr William P. Buffum, Providence, was reelected secretary. The next annual session will be held at Providence, June 2-3, 1943.

**Meeting of Pathologists**—The Rhode Island Society of Pathologists held its annual meeting of the current season at the Memorial Hospital, Pawtucket, June 19, to hear the following program: Drs John F. Kenney, Pawtucket, "How a Tumor Clinic Should Function", George Raymond Fox, East Providence, "Indications for Treatment with Radium", and Emanuel W. Benjamin, Providence, "Indications for Treatment with X-Ray Therapy". Drs Benjamin Earl Clarke, Providence, and Louis Goodman, Harvard, were reelected president and secretary, respectively.

### TEXAS

**Gifts to State Society's Library**—Dr and Mrs Neil D. Bure, Marlin, recently established a fund in their name for the Texas Memorial Medical Library Association with a gift of a \$1,000 war defense bond. Dr Preston Hunt, Texarkana, has increased the Hattie Preston Fund, established by him last year in memory of Mrs. Hunt, from \$600 to \$1,000. This fund is also used for library activities.

**State Medical Election**—Dr Charles S. Venable, San Antonio, was chosen president-elect of the State Medical Association of Texas during its recent annual meeting in Houston and Dr Judson L. Taylor, Houston, was installed as president. Vice presidents are Drs Robert B. Homan Jr., El Paso, William Howard Wells, Waco, and Hubert H. Cartwright, Breckenridge. Dr Holman Taylor, Fort Worth, was reelected secretary. San Antonio was chosen as the place for the 1943 meeting.

**Changes in Health Officers**—Dr Elbert Goolsby was recently appointed health officer of Paris. Dr Fred W. Sutton was placed in charge of the health department of Beaumont, succeeding Dr Charles Hugh Todd Jr., Beaumont, resigned. Dr William G. Carnathan, Henderson, has been appointed health officer of Rusk County, succeeding Dr Jesse E. Ross, Henderson, who has accepted a commission in the U S Navy. Dr Robert L. Cherry, Austin, has resigned as field director of local health services with the state department of health to become director of the Harris County Health Department.

### WISCONSIN

**Changes in Health Officers**—Dr Garret J. Ihmanen, Kaukauna, has been appointed city health officer to succeed Dr Charles D. Boyd. Dr Herman M. Lynch is health officer of West Bend, filling the vacancy that occurred when Dr Willibald J. Wehle resigned. At a meeting of the Cudahy Board of Health on April 27 Dr Sarkis H. Kashanian named health commissioner.

**Dr Ziegler Succeeds Dr Sleyster at Wauwatosa**—Dr Lloyd H. Ziegler, associate director of the Milwaukee Sanitarium, Wauwatosa, has been appointed medical director of the sanitarium to succeed the late Dr Rock Sleyster. Dr Ziegler graduated at the University of Minnesota Medical School at Minneapolis, and in 1931 was professor of neuropsychiatry at Albany Medical College, New York.

## GENERAL

**Examinations in Obstetrics and Gynecology**—The American Board of Obstetrics and Gynecology announces that the next written examination and review of case histories (part I) for all candidates will be held in various cities of the United States and Canada on Feb 13 1943. Candidates who successfully complete the part I examination proceed automatically to the part II examination held later in the year. Effective this year there will be only one general classification of candidates all now being required to have been out of medical school not less than eight years having in that time completed an approved one year general rotating internship and at least three years or approved special formal training or its equivalent in the seven years following the intern year. All candidates must be citizens of the United States or Canada before being eligible for admission to examination. All candidates will be required to take the part I examination, which consists of a written examination and the submission of 25 case history abstracts and the part II examination (oral-clinical and pathology examination). The part I examination will be arranged so that the candidate may take it at or near his place of residence while the part II examination will be held late in May 1943 in that city nearest to the largest group of applicants. Time and place of the latter will be announced later. Further information may be obtained from Dr Paul Titus, secretary, 105 Highland Building, Pittsburgh.

**Special Society Elections**—Dr Clyde L. Denning, New Haven Conn., was chosen president-elect of the American Urological Association at its annual executive session on June 3 in New York and Dr Cyrus E. Burford, St. Louis was installed as president. Drs Thomas D. Moore, Memphis Tenn., and Herbert H. Howard, Boston, are secretary and treasurer, respectively. Dr Wilder G. Penfield, Montreal Que., was elected president of the American Branch of the International League Against Epilepsy in Boston May 18. Dr Charles D. Aving, Cincinnati, vice president and Dr Frederic A. Gibbs, Boston, secretary-treasurer. Dr Ernest Sachs, St. Louis, was elected president of the American Neurological Association at its annual meeting in Chicago, June 6, and Dr Henry A. Riley, New York, was reelected secretary. Dr Arthur Bruce Gill, Philadelphia, was chosen president-elect of the American Orthopaedic Association at its annual meeting in Baltimore, June 6, and Dr Frank R. Ober, Boston, was installed as president. Dr Charles W. Peabody, Detroit, was reelected secretary. At the annual meeting of the American Otolaryngological Society in Atlantic City May 29, Dr Wesley C. Bowers, New York, was chosen president and Dr Isadore Friesner, New York, was reelected secretary. Dr Walter E. Vest, Huntington W. Va., was elected president of the American Therapeutic Society at its annual meeting, June 6 and Dr Oscar B. Hunter, Washington D. C. was reelected secretary. Dr Eugene M. Landis, Charlottesville Va., was elected president of the American Society for Clinical Investigation during its meeting in Atlantic City N. J. May 4. Dr Frank L. Horsfall Jr., New York, was named vice president, Dr Wesley W. Spink, Minneapolis, secretary, and Dr Charles A. Janeway, Boston, treasurer.

**Life Expectancy Reaches All Time High in 1941**—The *Statistical Bulletin* of the Metropolitan Life Insurance Company reports that the average length of life as computed on the basis of mortality among the company's industrial policyholders in 1941 was 63.42. This establishes an all time high for the sixty years for which the company has been recording this information. The estimated life expectancy for the period 1879-1889 was about 34 years. The report points out that one aspect of the improvement is that the average industrial policyholder at age 35 today still has as many years of life before him as the child in the wage earning family of 1879-1889 had at the time of its birth. Through the entire period the expectation of the life of white persons has always exceeded that of Negroes by a considerable margin. The current figures (1941) at age of 5 are 60.33 years for white males and 55.63 years for Negroes. For females the corresponding figures are 64.99 for the white and 57.71 for Negroes. For Negro males ages 15 to 33 the mortality rates are more than twice those for white males. In the case of females the ratio of Negro to white mortality is more than two to one at each age from 12 to 49 years, in fact at ages 15 to 24 the ratio is more than three to one. Children in wage earning families experienced exceptionally low mortality rates in 1941. For example mortality rates of less than 1 per thousand were experienced by white females at ages from 8 to 13 by white females at ages from 5 to 18 and by Negro females at ages 8 to 11. The lowest mortality rate experienced by Negro males was at

age 9 namely, 1.13 per thousand. In the case of white persons, mortality among men is greater than among women at each age of life, but among Negroes the rate for females is higher than that for males at ages from 15 to 24 years. This situation arises mainly from the much greater incidence of disorders of pregnancy and childbirth among Negro women as compared with white women.

**Providence Medical Association to Help Members in Military Service**—In a special issue devoted to military medical matters, *Medical News*, published by the Providence Medical Association outlines a plan whereby the accounts left behind by doctors who go into active military service will be looked after at a minimum expense of collection. By this plan the doctor called into military service would submit his collectable personal medical accounts to the office of the Providence Medical Association which will analyze them before the doctor leaves for service and in most cases would restrict the accounts to those not more than six months due. A special letter signed by the doctor would be sent to each patient stating that the doctor has entered the military service and requesting that payments on account be made through the executive office of the Providence Medical Association. Later a statement would be mailed from the association on a billhead bearing the doctor's name to indicate the balance due and to urge prompt payment as an expression of the patient's appreciation of the doctor's patriotic response to his country's call. Thereafter for a specific period statements will be mailed monthly, and accounts failing to respond would be turned back to the doctor for his personal disposition. The association would also make payments monthly to the person designated by the doctor. The executive office of the Providence Medical Association extends this service on a cost basis to its members in good standing who are in active military service. The service charges will cover only the cost of mailing the statements and that of secretarial work. This special issue of *Medical News* contains brief statements by the governor of Rhode Island, the mayor of Providence, the president of the Rhode Island Medical Society, the president of the Providence Medical Association and high ranking officers of the army and navy expressing appreciation of the patriotism of the doctors from Providence who have already entered the military service and pointing out to those who have not yet done so that the need for additional doctors for the armed forces is especially urgent at this particular time.

**Tire Rationing Regulations**—So serious is the situation as regards rubber available for tires that the Office of Price Administration has made new regulations regarding the rationing of tires for motor cars of persons in the medical and religious professions. The regulations follow.

## OFFICE OF PRICE ADMINISTRATION

An amendment to the tire rationing regulations which tightens requirements in some respects and extends eligibility for tires to certain automobile users heretofore not provided for has been issued by the Office of Price Administration. The amendment:

1. Requires that a vehicle operated by a physician, surgeon, farm, veterinary or practicing minister to be eligible for tires and tubes must be used exclusively for professional services or religious duties instead of principally as heretofore.

2. Makes licensed chiropractors and osteopaths eligible under the same conditions as apply to doctors of medicine.

3. Extends the eligibility of ministers to any religious practitioner qualified to administer to the religious needs of the members of a congregation.

4. Changes the designation of nurses eligible for tires from visiting nurse to public health nurse.

5. Extends eligibility for recapped or obsolete new tires to public school officials and teachers for necessary transportation between schools.

The eligibility standards for doctors and ministers have been changed to require that applicants must show that the vehicle on which a tire or tube is to be mounted is necessary because there is no other practicable means of transportation. Heretofore the requirement was a showing that the car was needed and used in making professional calls. Even under the new standards however if it is necessary for the applicant to answer emergency calls as a part of his professional practice he may have issued a certificate to enable him to use his car between his home, his office and hospitals.

In making osteopaths and chiropractors eligible under the same conditions as apply to physicians the OPA recognized that there are substantial numbers of people who rely solely on the treatments of such practitioners.

The term public health nurse instead of visiting nurse was adopted to define more accurately the type of nursing service that makes an applicant eligible. Eligibility is not extended to any group not covered heretofore. The new term includes school nurses employed by boards of education for work with school children, visiting nurses employed by groups such as public health nursing associations, health department nurses, county nurses and industrial nurses all of whom are employed for the purpose of making nursing or inspection calls for such agencies.

By the change in the section dealing with ministers, eligibility is extended to qualified practitioners of religious groups, such as the Christian Science Church, under the same requirements as apply to other ministers.

Public school officials and teachers are given eligibility for recapped tires or obsolete new tires only when they need automobiles to get them from one school to another in areas where there is no other practicable means of transportation. The vehicles must be used principally for this purpose or other eligible purposes. Certificates will not be issued to any teacher or official whose duties are performed wholly at one school, as the purpose of the amendment is to make tires available to teachers who conduct classes in several schools, and to supervisors who cannot meet the requirements of their positions without them.

Amendment 17, which makes the revisions, becomes effective July 1 (Document 1614)

## TITLE 32—NATIONAL DEFENSE

### CHAPTER XI—OFFICE OF PRICE ADMINISTRATION

Part 1315—Rubber and Products and Material of Which Rubber is a Component

Amendment No. 17 to Revised Tire Rationing Regulations (7 F R 1027, 1089, 2106, 2107, 2541, 2633)—Tires and Tubes, Retreading and Recapping of Tires, and Camelback

Section 1315 405 (a) and (b) are amended to read as follows and a new subparagraph (9) is added to section 1315 504 (a), as set forth below

#### Tires and Tubes for Vehicles Eligible Under List A

##### Section 1315 405 Eligibility classifications List A

(a) (1) A vehicle operated by a physician, surgeon, osteopath, chiropractor, farm veterinarian or public health nurse, which is necessary for the performance of professional duties and is used exclusively for such purpose

(i) The board may issue certificates under this paragraph only to physicians, surgeons, osteopaths, chiropractors or farm veterinarians who are licensed by the appropriate governmental agency or to public health nurses, if the use of a motor vehicle is necessary for the performance of their professional duties because of the nature of such duties and the absence of other practicable means of transportation

(ii) No certificate shall be issued under this paragraph unless the applicant shows that the motor vehicle on which the tire or tube is to be mounted is used exclusively for his professional duties. If the applicant's professional practice requires his answering emergency calls, the board may issue certificates to enable the applicant to use his vehicle for transportation between his home and his office or a hospital, even though other practicable means of transportation are available

(iii) For the purpose of this paragraph, "public health nurse" shall mean a nurse who is employed by a clinic, hospital, government agency or similar organization, or by an industrial concern, to make nursing or inspection calls for such agencies. The term "public health nurse" does not include private nurses

(b) (1) A vehicle operated by a regularly practicing minister of any religious faith who serves a congregation or any religious practitioner qualified to administer to the religious needs of the members of a congregation, if such vehicle is necessary for the performance of his religious duties because of the absence of other practicable means of transportation and is exclusively used for such purpose

(i) No certificate shall be issued under this subparagraph unless a motor vehicle is necessary to enable the applicant to perform the religious duties required under the beliefs of his church because of the absence of other practicable means of transportation and is used exclusively for such purpose

LEON HENDERSON,  
Administrator

## Government Services

### Dr Bolten in Charge of Quarantine Activities at Puerto Rico

Dr Joseph S Bolten, medical director, U S Public Health Service, has been relieved at Boston and assigned to San Juan, P R, to assume charge of quarantine and relief activities there and to serve as director of Public Health Service District No 6. He will also serve as liaison officer between the Puerto Rican Health Department, U S Army, Public Health Service and Insular Health Departments

### Changes in Department of Agriculture

Stanley B Fracker, Ph D, chief of the division of plant disease control of the Bureau of Entomology and Plant Quarantine, U S Department of Agriculture, has been appointed research coordinator on the staff of Eugene C Auchter, Ph D, agricultural research administrator. Dr Fracker will coordinate research dealing with plant diseases and insects affecting plants and animals and review plant pest control programs. He will be succeeded in the division of plant control by James F Martin, Ph D. All are of Washington, D C

### Entomologist Retires

Lon A Hawkins, Ph D, Washington, D C, is retiring as head of the division of control investigations in the bureau of entomology and plant quarantine, the U S Department of Agriculture announces. Curtis P Clausen, M S, Washington, D C, head of the division of foreign insect parasite introduction, will take over the work of the division of control investigations in addition to his parasite work until permanent arrangement are made for administration of this activity. Dr Hawkins has been with the department of agriculture for thirty-five years

### New Section on Foreign Health Relations

The Surgeon General of the U S Army has established a section on foreign health relations in the division of foreign and insular quarantine, placing Medical Director Charles V Akim, Washington, D C, in charge. According to the *Military Surgeon*, the new section aims to establish and maintain liaison with the department of state, Pan American Sanitary Bureau, offices of the surgeon general of the army and of the navy and other agencies for the proper collection and routing of information on foreign health and medical problems, including information on bacteriologic warfare

### Dr Armstrong Joins Public Health Service

Dr Donald B Armstrong, third vice president of the Metropolitan Life Insurance Company in charge of health and welfare work of policyholders, New York, has been appointed a senior surgeon in the reserve corps of the U S Public Health Service. Dr Armstrong's appointment to the public health service reserve is on a basis of inactive status, without compensation, barring major emergencies calling for additional aid of physicians with public health training. For the time being, he is assigned to his present task in connection with the public health, nursing, educational and medical research activities of the Metropolitan's welfare division

### Industrial Hygiene for Federal Employees

At the request of the Federal Council of Personnel Administration, the Division of Industrial Hygiene has completed a survey of the dispensaries and hygiene services in federal departments located in Washington, D C. These dispensaries for the most part are established and administered by the departments and bureaus concerned. It was found that of eighty-five dispensaries employing one hundred and fifty-five nurses, not more than twenty were under the supervision of a physician. Functions, activities, number of personnel and physical equipment varied widely. In no government agency was there found a comprehensive program of environmental and personal hygiene and preventive medicine such as is recommended for private industry.

These findings, with recommendations for establishment of a modern employees' health program in federal agencies, were forwarded by the Surgeon General of the U S Public Health Service to the Council of Personnel Administration on June 2. The over-all recommendations called for improvement in organization, personnel, utilization of space and equipment in the dispensaries with the provision that all should be operated under medical supervision. Specific recommendations for the program included

- 1 A good preplacement examination, including a chest roentgenogram as a serodagnostic test for syphilis, urinalysis and other laboratory studies as indicated
- 2 Treatment of minor medical emergencies including dental services and referral of serious cases to private physicians
- 3 Psychiatric consultation in cases of minor emotional disturbance and of serious mental illnesses
- 4 Nutrition consultant services both for government employees and for consultation on special individual problems, such as obesity, underweight and diabetes
- 5 Elimination or control of environmental hazards such as poor lighting, gross overcrowding and defective ventilation, including vision of air conditioning
- 6 Systematic reporting and recording of absenteeism, including comparison of absenteeism in the several agencies
- 7 Promotion of health education

It was further recommended that the Public Health Service be given the responsibility for organizing and supervising a program in order to secure uniform services of high quality for the two hundred and fifty thousand federal employees around Washington. The special consultant services will be provided by the Public Health Service

## Foreign Letters

### LONDON

(From Our Regular Correspondent)

MAY 23, 1942

#### Army Convalescent Depots

Army convalescent depots are maintained for the reception of soldiers who require no further active treatment and are likely to become fit for duty within a short period. The aim is to hasten convalescence and harden by graduated exercises under medical supervision. Much experience was gained in running these depots in the last war. The establishment then was for 2,000 patients per depot. In summer they can be accommodated in tents and marquees, but huts or buildings have to be used in winter. The men go through a graded training so as to fit them for duty on discharge. If a patient relapses, he is returned to the hospital. One who cannot be made fit to return to full duty may be brought before a medical board to decide whether to discharge him from the army or lower his medical category so that he can be employed on duties for which he is capable.

In this war the cases dealt with have been among men convalescing from sickness, convalescing from operations performed to make them fit for service or convalescing from the French and Norwegian campaigns and a considerable number of French, Polish, Czech, Dutch and Belgian soldiers evacuated to this country. The treatment includes physical training to inculcate rhythm, balance and mental alertness as well as to exercise the muscles, organized games with instructors, intellectual amusement, talks and lectures. Classes in mathematics and languages are established. Psychiatrists deal with neuroses.

#### Civilian Protection Against Poison Gas

Every civilian is provided with a respirator for protection against poison gas and special ones have been provided for infants. At the time of the air raids respirators were regularly carried, but with their almost complete cessation masks are seldom seen in the streets. However, after the statement that an attack with poison gas on the Russians is projected, people are warned by the government to test their respirators and see that they are in order. A steady overhaul of anti-gas precautions has taken place in the last few months. Local authorities and civil defense workers have been busy checking and examining respirators issued to civilians. Great importance is attached to the injunction to practice wearing masks for a short time each day. It has been found that some masks have become faulty, mainly because the owners screwed them into containers they were never intended to fit. The warning is given again 'Always carry your gas mask.' Some concern has been expressed as to the possible discovery and use by the enemy of some new and more deadly gas. But an official of the Ministry of Home Security has stated that there is no gas known to scientists as a possible war gas against which the civilian respirators are not a protection.

#### Medical Women Demand Equality with Men in the Fighting Services

This war is remarkable for the extent to which women's services are used, though not except perhaps in Russia in the actual fighting. Women physicians are being employed, but their old demand for equality with men is giving rise to some trouble. In a letter to the medical press the president of the Medical Women's Federation, Dr Clara Stewart, states that they are most anxious that women should respond to the appeal for doctors in the fighting forces, but the federation is profoundly disturbed that the established principle of complete equality with men is infringed. When a medical man receives a commission in the fighting services it is argued that he is a

soldier as well as a doctor, that he may be asked to carry out combatant duties, and he is given general disciplinary powers. A medical woman is offered a commission in the women's forces for service with the medical corps. It is argued that there is no authority for offering her a commission in the medical services, that she cannot have disciplinary powers and combatant duties.

The president says that her letter is not the place to enter into the validity of these arguments and admits that women doctors are in complete equality with men as regards pay and allowances and have "relative rank", also that as a rule they work happily under their commanding officers and receive fair and just treatment. But the federation holds that they suffer a definite handicap. They are not members of any service and have no settled status. Regulations peculiar to them may be made at any time. The federation is strongly of the opinion that to grant women commissions in the medical service would promote greater efficiency and stability. This would insure a recognized status and the protection of a professional body having defined conditions and established precedents. The present inequality is a retrograde step contrary to the principles accepted as fundamental by the British Medical Association. The federation therefore advises medical women to accept "relative rank" for the time being, but not to accept commissions in the women's forces, which would permanently put them in a separate category from their male colleagues.

#### Closing of Medical Posts in London's Air Raid Shelters

During the period of air raids on London two hundred and three medical air raid posts, attended by physicians and three hundred and ninety nurses, were maintained by the Ministry of Health. The main object of this medical service, which has been in existence since the winter of 1940, was to prevent the spread of infectious disease. Now that the most dangerous season for epidemics has passed and with the cessation of air raids on London for nearly a year the number of persons who regularly sleep in air raid shelters has fallen to eight thousand six hundred, an average of forty-three per medical aid post. The Ministry of Health has therefore closed nearly all these posts. Those in shelters regularly used by more than five hundred persons will remain open.

#### Avascular Necrosis in Fractures and Other Lesions of Bone

At the Section of Radiology of the Royal Society of Medicine Mr. Watson-Jones opened a discussion on avascular necrosis in fractures, dislocations, Perthes disease, congenital necrosis and monarticular osteoarthritis of the hip. The femoral head derived its blood mainly from the capsular vessels. Rupture or thrombosis of these arteries producing avascular necrosis was the pathologic condition found in degenerative arthritis after fracture of the neck of the femur, traumatic dislocation and epiphyseal displacement. It was also the condition found in Legg-Perthes disease and probably in many cases of unexplained monarticular arthritis of the hip. In nailed fractures of the femoral neck there were five radiographic signs of avascular necrosis. 1 Within a few weeks the head appeared relatively dense because it did not participate in disuse decalcification. But this sign was masked by early junctional activity, which minimized the effect of disuse. Films should therefore be taken at the sixth, eighth and tenth weeks. In one film showed a dense head, the blood supply was impaired and necrosis would supervene. 2 Within a few months the nail showed increasing penetration of the head, especially in weight bearing was permitted. 3 After several months the nail ploughed upward and forward through the head, necrosis was more complete and the nail must be removed and bisection osteotomy performed. 4 After six to twelve months union of

the fracture was incomplete despite successful and accurate nailing. If the nail had been inadvisedly removed and displacement had recurred, renailing was not indicated, a bifurcation osteotomy was better. 5 After several years, degenerative arthritis proved that the head was avascular, even if earlier signs had been overlooked.

Avascular necrosis developed in about 30 per cent of fractures of the femoral neck treated with operative reduction which damaged capsular vessels and in about 15 per cent of fractures treated by extra-articular nailing. The nail itself played no part, necrosis was no less frequent and no less severe when it was not used. Necrosis occurred in over 30 per cent of recent dislocations and in nearly 100 per cent of overlooked dislocations where operative reduction and capsular dissection were necessary. Legg-Perthes disease was an avascular necrosis of the upper femoral epiphysis, which might be due to fracture of the neck in children, traumatic dislocation of the hip with rupture of the capsule in children, operative reduction of a congenital dislocation with dissection of the capsule, any operation on the hip which involved capsular injury, or any thrombosis or embolism of capsular vessels. Treatment by immobilization in plaster was worthless. Coxa plana could be avoided and a normal contour of the head preserved by traction and recumbence for one or two years. But the regenerated articular cartilage was likely to be imperfect and a late arthritis might supervene. The frequency of osteoarthritis of the hip joint was due to the precarious blood supply of the femoral head, the vulnerability of the capsular vessels and their lack of anastomosis with other vessels. Osteoarthritis of the hip joint was the adult form of Legg-Perthes disease.

#### Czechoslovak Medical Journal Published in London

The historic role of England as a refuge from persecution on the continent of Europe has never been so great as it is today. We have now colonies of the inhabitants of almost every European nation, refugees from German barbarity. In large numbers they have joined our fighting forces, and their uniforms are a common sight in the streets. These nations have their own clubs and other organizations here. As reported previously in *THE JOURNAL*, a Polish university has been formed within the confines of Edinburgh University, and the Royal College of Surgeons has examined Czech students for their diplomas. The Czechs are now publishing a medical journal in London, the *Bulletin of the Czechoslovak Medical Association in Great Britain*. In the first number, which is entirely in English, there is a foreword by Lord Horder, who says that medicine knows no racial distinctions and recognizes no geographic boundaries. The paralysis of its advance is one of the most serious effects of Germany's crime committed against civilization. But the pages of this journal show that the spirit of colleagues who in this country keep the flame of learning and healing alight cannot be killed.

Dr Karel Machacek, director of the department of public health of the Czechoslovak Ministry of Social Welfare, describes its work in Britain. Shortly after the Czechoslovak government was formed in London a department of public health was set up under this ministry. The temporary separation from their territory ruled out many branches of their activities, but the members of the department were able to acquire much knowledge of the public health system of a great country, which will be valuable for the restoration in free Czechoslovakia. The hardships of the refugees, the sudden change of climate, different food and social conditions and anxiety produced a morbidity among civilians as high as 25 per cent. Medical care is carried out in cooperation with the Czechoslovak Red Cross, which has a well equipped clinic with social workers. Soldiers invalided out of the Czechoslovak army form a separate group. In addition to allowances and medical attention they are supplied

with artificial limbs. Hospital accommodation has been provided through the generous cooperation of the English hospitals. The department has helped in obtaining employment for the two hundred and fifty Czechoslovak physicians in Britain. As Czechoslovakia will be in need of physicians after the war and all its universities have been closed, it is important that Czechoslovak undergraduates living here should complete their studies. Thanks to the British medical schools, many are now completing their interrupted studies. Efforts are also being made to train the greatest possible number of nurses, who will also be required when they go home.

Dr Oscar Khinger, medical director of the Czechoslovak Red Cross in London, describes the work in Britain. It now maintains an extensive clinic with special departments for diseases of the eye, ear, nose and throat and of the skin. Dr F Horowitz describes the welfare work of the Refugee Fund. The work of the Czechoslovak physicians in Britain is outlined. Soon after arriving, application was made by them for leave to settle here. The majority of those in Britain are now employed. The demand for Czech physicians in the merchant navy now exceeds the supply. The number concludes with an account of health services and social insurance in the Czechoslovak republic.

#### Age and the Council of the Royal College of Surgeons

In a joint letter which has appeared in the medical press a number of the younger surgeons, in view of the forthcoming election to the council of the Royal College, call attention to the fact the average age of its members is over 62 years and three are septuagenarians. In their view the council needs reinforcement with younger surgeons to help to shape its policy in these anxious times. A fellow is elected to the council for a first term of eight years, and it is the custom that he should serve a second, making sixteen years in all. Of late there has been an increasing tendency for members of the council to seek a third term. The signatories regard this as harmful, as it increases the number of septuagenarians and delays the successful candidature of men of the right type and age, so that they either abandon their hopes or have to apply when already too old. In the present election two members of the council are offering themselves for a third term, while other candidates are of such an age that the end of the first term will bring them near 65. The trend of affairs shows that the profession must face complex problems in the reorganization of the whole structure of our professional lives and our relation to the state. Those who have to live and work in the new world should help to fashion it. Hence the need for younger men on the council.

There is force in these arguments, but something can be said on the other side. The government of the college is and always has been excellent under the present system. The elders of the council are some of the most eminent men in the profession and are fully competent for their duties. It is well known that in eminent men the mental faculties are often well preserved late in life.

#### Marriages

GABEL G HIMMELWRIGHT JR, Newport News, Va., to Miss Margaret Elizabeth Hodges of Washington, N. C., in April.

CHARLES J DONALD JR, Fairfield, Ala., to Miss Maude Medler of Seattle in Rochester, Minn., April 12.

CHARLES H POOLE JR to Miss Nancy Cleveland, b. at Spartanburg, S. C., April 6.

EDWARD G SCHOTT to Miss Barbara Allman, both of Springfield, Wis., March 28.

FLOYD THOMAS BOUDREAU to Miss Margie Sellers, both of Mobile, Ala., recently.

## Deaths

Marcus Ward Lyon Jr. ♂ South Bend, Ind. Columbian University Medical Department, Washington D. C. 1902, instructor of bacteriology at the North Carolina Medical College Davidson 1897-1898, assistant professor of physiology, 1903-1904 and from 1907 to 1909 and professor of bacteriology from 1909 to 1915 Howard University, Washington, D. C. professor of bacteriology and pathology from 1915 to 1917 and professor of veterinary zoology and parasitology, 1917-1918 George Washington University, Washington, certified by the American Board of Pathology, Inc. member of the American Association of Pathologists and Bacteriologists, Society of American Bacteriologists, American Society of Clinical Pathologists, American Society of Parasitologists, American Ornithologists Union, Washington Academy of Sciences and the American Society of Tropical Medicine, past president of St. Joseph County (Ind.) Medical Society, secretary of the Biological Society of Washington from 1915 to 1919, past president of the American Society of Mammalogists, past president and treasurer of the Indiana Academy of Science, aide, later assistant curator division of mammals U. S. National Museum, Washington, from 1898 to 1912, served during World War I pathologist Walter Reed General Hospital Washington, from 1917 to 1919 pathologist South Bend Clinic author of 'Mammals of Indiana', aged 67, was found dead, May 19, of coronary disease.

Henry Dwight Chapin ♂ Bronxville, N. Y., College of Physicians and Surgeons medical department of Columbia College New York 1881 chairman of the Section on Diseases of Children, American Medical Association 1912-1913, emeritus professor of pediatrics at the New York Post-Graduate Medical School and Hospital founder of the Speedwell Society charter member and in 1910 president of the American Pediatric Society in 1933 received a medal from Columbia University for outstanding contributions to problems relating to the care of children and as a pioneer in hospital social service, formerly member of the board of directors of the New York Post-Graduate Medical School and Hospital and chairman of its social service committee formerly supervising physician of the children's department, New York Post-Graduate Hospital attending physician at the Willard Parker and Riverside hospitals consulting physician to the Randall's Island Hospital St. Agnes Hospital at White Plains Convalescent Home for Children at Sea Cliff and the Hackensack (N. J.) Hospital co-author with Dr. L. T. Royster of 'Pediatrics' and with Dr. G. R. Pisek of 'Diseases of Children' author of 'Theory and Practice of Infant Feeding' and 'Heredit and Child Culture' aged 85 died, June 27.

Maximilian John Hubeny ♂ Chicago Hahnemann Medical College and Hospital Chicago 1906 College of Physicians and Surgeons of Chicago School of Medicine of the University of Illinois 1909 certified by the American Board of Radiology secretary of the Section on Radiology of the American Medical Association from 1923 to 1926, member of the American Roentgen Ray Society member and past president of the Radiological Society of North America Chicago Roentgen Society and the American College of Radiology fellow of the American College of Physicians professor of roentgenology and chairman of the department Cook County Graduate School of Medicine chief of the x-ray department Cook County Hospital formerly roentgenologist Henrotin Hospital and the Municipal Tuberculosis Sanitarium, formerly editor of *Radiology* and associate editor of the *American Journal of Cancer* *Italian Journal of Radiology* and the *Cuban Journal of Radiology* in 1931 was awarded a gold medal by the Radiological Society of North America for research aged 61 died July 2.

Roy Knight Flannagan, Richmond Va. University of Virginia Department of Medicine Charlottesville, 1894, formerly health officer of Charlottesville director of inspection state health department in 1910 in 1915 assistant state health commissioner health commissioner of Richmond 1917-1918 appointed director of the rural health work venereal disease control and tuberculosis outpatient service, state health department in 1919 since 1932 assistant commissioner of health on detail duty in connection with medical service in local prisons with the title of medical adviser state department of public welfare past president of the State Conference of Charities and Corrections and formerly secretary of the Virginia Tuberculosis Association member of the Medical Society of Virginia Richmond Academy of Medicine Southern Medical Association American Association for the Advancement of Science American Public Health Association, American Geographic Society and the American Prison Association aged 71 died, June 17.

Edson Brady Fowler ♂ Evanston, Ill., Northwestern University Medical School Chicago 1896, instructor in clinical medicine at his alma mater from 1898 to 1911, member of the Clinical Orthopaedic Society and the American Academy of Orthopaedic Surgeons, fellow of the American College of Surgeons and the Institute of Traumatic Surgery president of the Evanston Branch of the Chicago Medical Society, 1927-1928 major in the medical corps of the U. S. Army during World War I, during which time he was chief orthopedic surgeon at Camp Shelby, Miss. and Fort Sheridan, Ill. formerly president of the staff and for many years chief of the department of fractures and orthopedic surgery at St. Francis Hospital where in 1940 he was placed on the emeritus staff, aged 77, died June 22, of cerebral hemorrhage.

Charles Howard Evans Sr., Waddington, N. Y., Syracuse University College of Medicine 1909 health officer of the town of Waddington, formerly member of the health department of Syracuse, served during World War I, at one time on the staffs of the Crouse Irving and Psychopathic hospitals at Syracuse Lewis County Hospital at Lowville and the House of the Good Samaritan at Watertown aged 59, died, May 10 in the A. Barton Hepburn Hospital Odensburg of a cellulitis of the neck and mediastinum caused by hemolytic *Staphylococcus aureus*.

Irwin Hoffman Neff ♂ Detroit, University of Maryland School of Medicine, Baltimore, 1889, member of the American Psychiatric Association, formerly assistant physician at the Kalamazoo (Mich.) State Hospital and on the staff of the Pontiac (Mich.) State Hospital, at one time superintendent of the Foxboro (Mass.) State Hospital, on the staff of the Grace Hospital served as major in the medical corps of the U. S. Army during World War I, aged 73, died, May 11 in St. Joseph's Mercy Hospital.

Saul Joseph Selkin, New York Albany Medical College 1910 member of the Medical Society of the State of New York, certified by the American Board of Otolaryngology formerly instructor and associate in otolaryngology at the New York Post-Graduate Medical School and Hospital assistant attending otolaryngologist to the New York Post-Graduate Hospital and Dispensary, aged 58 died April 20, in Tucson Ariz. of hemorrhage from erosion of right internal carotid artery.

August Edward Gerhardt ♂ Wenatchee, Wash., Northwestern University Medical School Chicago 1909 member of the Pacific Coast Surgical Association fellow of the American College of Surgeons certified by the American Board of Surgery served as a major during World War I, lieutenant colonel in the medical officers reserve corps assistant division surgeon Great Northern Railroad, on the staff of the Central Washington Deaconess Hospital aged 59, died, May 3.

George Arthur Reed ♂ Erie Pa. University of Pennsylvania Department of Medicine Philadelphia 1895, for many years president of the Erie County Health and Tuberculosis Association, member of the board of health of Erie formerly member of the board of trustees of the Warren (Pa.) State Hospital member of the advisory board of the Erie County Tuberculosis Hospital on the staff of St. Vincent's Hospital, aged 73 died May 12.

Minnie Celia Tucker Love, Denver Howard University College of Medicine, Washington D. C., 1887, member of the Colorado State Medical Society formerly member of the state board of health, at one time member of the state house of representatives formerly member of the city board of education served on the staff of the Florence Crittenton Home aged 86 died May 12, in the Presbyterian Hospital.

Glenn Grieve, Big Rapids, Mich. University of Michigan Medical School Ann Arbor 1918 member of the Michigan State Medical Society, at one time secretary of the Mecosta County Medical Society, formerly member of the school board until recently chairman of the county draft board on the staff of the Community Hospital aged 62 died, May 3.

James Beaty Griffith ♂ Washington D. C. University of Tennessee College of Medicine Memphis 1918, member of the American Academy of Ophthalmology and Otolaryngology certified by the American Board of Ophthalmology staff surgeon of the Episcopal Eye, Ear and Throat Hospital, aged 51, died, May 6 of a self-inflicted bullet wound.

James Patrick Glynn, Brooklyn College of Physicians and Surgeons medical department of Columbia College New York 1894 fellow of the American College of Surgeons consulting obstetrician and gynecologist St. Mary's Hospital consulting gynecologist Williamsburgh Hospital Rockaway Beach (N. Y.) Hospital, aged 72 died May 8.

**Julia Clark Strawn** ☉ Chicago, Hahnemann Medical College and Hospital, Chicago, 1897, College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1903, fellow of the American College of Surgeons, on the staff of the Chicago Memorial Hospital, aged 73, died, May 31, at New Salem, Ill

**Carl Helmuth Mueller Jr**, Brooklyn, Cornell University Medical College, New York, 1911, member of the Medical Society of the State of New York, fellow of the American College of Surgeons, aged 52, on the staffs of the Bethany Deaconess Hospital and the Wyckoff Heights Hospital, where he died, May 21

**Iver Ferdinand Selleseth** ☉ Minneapolis, University of Minnesota Medical School, Minneapolis, 1916, member of the Clinical Orthopaedic Society, served as a captain in the medical corps of the U S Army during World War I, on the staff of the Lutheran Deaconess Home and Hospital, aged 52, died, May 12

**Alfred Stephen Doyle** ☉ Philadelphia, Medico-Chirurgical College of Philadelphia, 1914, member of the American Roentgen Ray Society, at one time associated with the U S Public Health Service, formerly president of the staff of St Agnes Hospital, on the staff of St Vincent's Hospital, aged 66, died, May 1

**George McIntyre** ☉ Long Beach, Calif, University of Michigan Department of Medicine and Surgery, Ann Arbor, 1887, an Affiliate Fellow of the American Medical Association, member of the Minnesota State Medical Association, at one time health officer of Mayville, N D, aged 81, died, May 3

**William Cumback Lathrop** ☉ Norton, Kan, Chicago Homeopathic Medical College, 1902, College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1909, member of the state board of health, on the staff of the Norton Hospital, aged 65, died, April 27

**Cornelius Joseph O'Leary**, Boston, Tufts College Medical School, Boston, 1933, member of the Massachusetts Medical Society, associate medical examiner of the Northern district of Suffolk County, formerly member of the city board of health, aged 39, died, May 21, of heart disease

**Thompson Tyler Sweeny**, New York, Kentucky University Medical Department, Louisville, 1897, formerly assistant professor of gynecology at the New York Post-Graduate Medical School, Columbia University, aged 67, died, May 4, while on a fishing trip near San Bernardino, Calif

**Harry Newton Moser** ☉ Terra Alta, W Va, George Washington University School of Medicine, Washington, D C, 1915, past president and secretary of the Preston County Medical Society, aged 69, died, April 14, in the Kercheval Memorial Clinic, Kingwood, of cerebral thrombosis

**John Charles McMillan**, New Berlin, Ill, Missouri Medical College, St Louis, 1898, member of the Illinois State Medical Society, for many years president of the high school board of education, aged 68, died, May 15, in Rochester, Minn, of arteriosclerotic cardiovascular disease

**Barney Weeks Phillips**, Milford, N Y, New York Homeopathic Medical College and Flower Hospital, New York, 1919, member of the Medical Society of the State of New York, for many years served the consolidated health district of Milford, aged 49, died, May 4

**Murison Dunn** ☉ Richmond, Ky, University of Louisville Medical Department, 1894, past president and secretary of the Madison County Medical Society, formerly county health officer, at one time acting assistant surgeon, U S Public Health Service, aged 70, died, May 16

**Gladstone Edwin Francisco**, Miami, Fla, Hahnemann Medical College and Hospital of Philadelphia, 1934, member of the Florida Medical Association, aged 34, on the staff of the Jackson Memorial Hospital, where he died, May 2, of an accidental overdose of narcotics

**Frank Frederick Celce**, Holyoke, Mass, University of Pennsylvania Department of Medicine, Philadelphia, 1893, member of the Massachusetts Medical Society, formerly on the staff of the Holyoke Hospital and the Providence Hospital, aged 74, died, April 28

**Jay Maitland Schaffer**, Tremonton, Utah, Fordham University School of Medicine, New York, 1918, member of the Utah State Medical Association, past president of the Box Elder County Medical Society, served during World War I, aged 45, died, May 7

**James Thomas Reid** ☉ Iola, Kan, Medico-Chirurgical College of Kansas City, Mo, 1901, member of the state board of health, served as a captain in the medical corps of the U S

Army during World War I, on the staff of St John's Hospital, aged 62, died, May 14

**Agnes Mella Edmonds**, Los Angeles, Northwestern University Woman's Medical School, Chicago, 1900, formerly a medical missionary in Chungking, West China, where she was superintendent of the William Gamble Memorial Hospital, aged 71, died recently

**William Hearst McBain** ☉ Malden, Mass, Harvard Medical School, Boston, 1901, member of the New England Obstetrical and Gynecological Society, at one time city bacteriologist, formerly on the staff of the Malden Hospital, aged 68, died, May 9

**Joseph Edward Stephan**, Mount Healthy, Ohio, Medical College of Ohio, Cincinnati, 1892, served during World War I, formerly on the staffs of the Veterans Administration facilities in Togus, Maine, and Marion, Ind, aged 73, died, May 20

**Algernon R Fike** ☉ Spartanburg, S C, Medical College of the State of South Carolina, Charleston, 1892, formerly member of the city board of health, aged 72, died, May 13, in a hospital at Tarpon Springs, Fla, of cerebral hemorrhage

**Joseph Theodore McAndrew**, La Plata, Md, University of Maryland School of Medicine and College of Physicians and Surgeons, Baltimore, 1929, member of the Medical and Chirurgical Faculty of Maryland, aged 37, died in May

**Fred R Gobbel**, English, Ind, Kentucky School of Medicine, Louisville, 1901, for many years bank president, aged 84, died, May 17, in the Kentucky Baptist Hospital, Louisville, of shock due to a fractured hip received in a fall

**Franklin A Gray**, Batesville, Ark, Memphis (Tenn) Hospital Medical College, 1905, member of the Arkansas Medical Society, medical director and owner of a hospital bearing his name, aged 64, died, May 18

**Arthur Ludwig Herman** ☉ Minneapolis, University of Minnesota Medical School, Minneapolis, 1923, fellow of the American College of Surgeons, on the staffs of the Eitel and Asbury hospitals, aged 41, died, April 24

**Hattie Ashleigh Galentin Schwendener**, Benton Harbor, Mich, University of Wooster Medical Department, Cleveland, 1879, formerly on the staff of the Mercy Hospital, aged 84, died, May 10, of cerebral hemorrhage

**Samuel J Park**, Chicago, College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1906, for many years physician for the police department, aged 60, died, May 15

**Frank S Merwin**, Youngstown, Ohio, Western Reserve University Medical Department, Cleveland, 1893, member of the Ohio State Medical Association, aged 73, died, May 10, of chronic myocarditis

**Charles Allen De Voe**, Berlin, Wis, College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1900, aged 69, died, May 1, of coronary thrombosis and arteriosclerosis

**Clarence Edward Quaife** ☉ Galesburg, Ill, Louisville (Ky) and Hospital Medical College, 1908, aged 66, on the staff of the Galesburg Cottage Hospital, where he died, May 2, of diabetes mellitus

**John Karl Endress**, St Paul, University of Minnesota College of Medicine and Surgery, Minneapolis, 1899, aged 83, died, May 14, in the West Side General Hospital of lymphatic leukemia

**Lucius Orange Gibson**, Ann Arbor, Mich, University of Michigan Department of Medicine and Surgery, Ann Arbor, 1891, aged 81, died, May 8, of coronary thrombosis

**Edward L Bower** ☉ Guthrie Center, Iowa, University of Michigan Department of Medicine and Surgery, Ann Arbor, 1886, aged 77, died, May 5, of myocarditis

**Charles E Stadler**, Lima, Ohio, Eclectic Medical Institute, Cincinnati, 1896, aged 78, died, May 20, in St Rita's Hospital of arteriosclerosis and heart disease

**Charlotte Frances Hammond**, Paris, Maine, Boston University School of Medicine, 1887, aged 87, died, April 1, of cerebral hemorrhage

**Albert G Lueders**, Fort Wayne, Ind, Homeopathic Medical College of Missouri, St Louis, 1898, aged 66, died, May 18, of heart disease

**Omer Felix Perdue**, St Louis, Meharry Medical College, Nashville, Tenn, 1916, aged 58, died in May of pneumonia

**Franklin Pierce Hoy**, Watsonville, Calif, Hahnemann Medical College of Philadelphia, 1879, aged 83, died, May 12

**Thomas Shields Collins**, Los Angeles, Hospital College of Medicine, Louisville, Ky, 1886, aged 76, died, April 9

## Bureau of Investigation

### MISBRANDED PRODUCTS

#### Abstracts of Notices of Judgment Issued by the Food and Drug Administration of the United States Department of Agriculture

[EDITORIAL NOTE—These Notices of Judgment are issued under the Food, Drug and Cosmetic Act and in cases in which they refer to drugs and devices they are designated D D N J and foods, F N J. The abstracts that follow are given in the briefest possible form (1) the name of the product, (2) the name of the manufacturer, shipper or consigner, (3) the composition, (4) the type of nostrum, (5) the reason for the charge of misbranding and (6) the date of issuance of the Notice of Judgment—which is considerably later than the date of the seizure of the product and somewhat later than the conclusion of the case by the Food and Drug Administration.]

**American Electric Vaporizer**—American Sundries Company, Inc. Brooklyn. A device consisting of a jar equipped with two electrodes and intended to produce vapors. Falsely represented on label to be efficacious in the treatment of bronchitis, asthma, whooping cough and other respiratory disorders and in purifying the air in household and public rooms by vaporizing a few drops of pine needle oil.—[D D N J F D C 185 April 1941]

**Bromo Citra**—Dr. E. L. Company, Elgin, Ill. Composition principal ingredient acetanilid although product was represented to be derived from sodium bromide and hence misbranded. Further misbranded because falsely represented as a proper treatment for discomfort due to simple headache, neuralgia and overindulgence in food, drink or tobacco.—[D D N J F D C 141 April 1941]

**Bromoforbia (Bromophorbia)**—Pharmaceutical Products Company, Easton, Md. Composition 8½ grains of sodium iodide per fluidounce whereas label represented the amount as 16 grains, hence adulterated and misbranded. Use not stated.—[D D N J F D C 168 April 1941]

**Cactus Compound Tablets**—Pharmaceutical Products Company, Easton, Md. Misbranded because it contained active ingredients other than cactus and because nitroglycerin content per tablet was only 1/200 grain whereas 1/100 grain was claimed on the label. Use not stated.—[D D N J F D C 168 April 1941]

**Doctorheat Table Model Infra Red Lamp**—F. C. Herman Company, Chicago. The device was a metal goose-neck table model reflector lamp fitted with a heating unit. Misbranded because falsely represented as to its value in treating arthritis, asthma, hoarseness, bronchitis, painful menstruation, pneumonia and some other conditions.—[D D N J F D C 192 April 1941]

**Domino Brand Antiseptic Rubbing Compound**—Halitosine Company, St. Louis. Composition not reported. Misbranded because falsely represented as an antiseptic rubbing compound consisting of rubbing alcohol or an equivalent.—[D D N J F D C 177 April 1941]

**Dr. Burnham's San Yak K L B Pills**—Lee Chemical Company, Birmingham, Mich. Composition chiefly plant extracts including cinchona alkaloids, sandalwood and emodin, hearing drugs with magnesium, calcium and iron salts. Misbranded because labels represented it as a remedy for blood, kidney, liver and bladder disorders, hemorrhoids and pains in the back or joints. Further misbranded because label failed to declare active ingredients.—[D D N J F D C 175 April 1941 and D D N J F D C 368 March 1942]

**Dr. Stover's Golden Oil**—Planet Products Company, Orlando, Fla. Composition essentially mineral oil and oils of turpentine and mustard with chloroform (0.88 min. per fluidounce) and a coloring material. Misbranded because represented on label as a remedy for pains, colds, swellings, asthma, hay fever and sinus trouble and because label did not bear the common name of each active ingredient or the quantity of chloroform present.—[D D N J F D C 176 April 1941]

**Hills Nose Drops**—Anacin Company (Wyeth Chemical Company distributors), Jersey City, N. J. Composition not stated. Misbranded because falsely represented as efficacious for the quick relief of simple or nasal catarrh and tightness of the throat.—[D D N J F D C 178 April 1941]

**Holford's Famous Inhaler**—Holford Company, Minneapolis. Composition a mixture of plant material including eucalyptus leaves and lavender flowers saturated with essential oils such as mustard, eucalyptus and camphor. Misbranded because falsely represented on label as an efficacious treatment for catarrh, headaches, asthma, hay fever and some other disorders.—[D D N J F D C 179 April 1941]

**IVC A B D G Capsules**—International Vitamin Corporation, Brooklyn. Adulterated because it contained not more than 25 international units of vitamin B<sub>1</sub>, 800 international units of vitamin D and less than 10,000 international units of vitamin A per capsule instead of respectively 50, 945 and 10,000 as represented.—[D D N J F D C 173 April 1941]

**Jiffy Vaporizer**—Spielman & Company, New York. An electrically heated device to produce steam. Falsely represented as to its efficacy in relieving bronchitis, asthma, hay fever, whooping cough, laryngitis and catarrh and for purifying the air.—[D D N J F D C 183 April 1941]

**Kaz For Colds**—Kaz Manufacturing Company, New York. Composition essentially a mixture of oils of eucalyptus, peppermint, wintergreen and lavender with menthol and camphor in a mineral oil base used in an electric heating device for producing steam. Label falsely represented it as an effective treatment of throat, lung and nasal congestions including croup, whooping cough, asthma, chest colds and similar complaints.—[D D N J F D C 184 April 1941]

**Laxatonic Cold Tablets**—Pharmaceutical Products Company, Easton, Md. Composition 0.42 grain of quinine sulfate per tablet. Hence adulterated and misbranded because claimed to contain ½ grain of quinine sulfate per tablet. Also misbranded because not a laxative tonic as name represented.—[D D N J F D C 168 April 1941]

**Mastercraft Infra Red Therapeutic Lamps Type No. 62**—Northern Electric Company, Chicago. A table model reflector lamp fitted with an incandescent bulb. Label falsely represented that the device would counteract aches and pains with nature's soothing healing rays from the sun which penetrate deeply into the flesh, stimulate the nerves, rebuild diseased tissues, promote bodily health and vitality and prove effective in the treatment of bladder trouble, bronchitis, eczema, rheumatism, menstrual pains, sciatica and many other disorders.—[D D N J F D C 191 April 1941]

**Medovapo Inhaler**—Med O Vapo Company, Minneapolis. Composition alcohol (57.8 per cent), benzoic acid (19 grains per fluidounce), menthol, camphor, thymol, pine oil and water. Falsely represented as a modern inhaling treatment of hay fever, sinus pains, catarrhal congestion and bronchitis.—[D D N J F D C 182 April 1941]

**Nazeno Drops for Nose and Throat**—Brunswick Drug Company, Los Angeles. Composition small amounts of ephedrine, chlorbutanol, menthol and cinnamic aldehyde in a mineral oil base. Misbranded because falsely represented on label as a treatment for superficial inflammatory conditions of the nose and throat.—[D D N J F D C 180 April 1941]

**No. 1119 Modern Infra Red Ray Lamp**—Knapp Monarch Company, St. Louis. A table model lamp fitted with a heating element. Falsely represented on label to penetrate deeply under the skin, forming heat units which would cause an excess accumulation of blood and produce beneficial chemical changes, increase nutrition and cause the white corpuscles to destroy any microbes which might be present and to benefit abscesses, boils, heart diseases, gangrene and many other disorders.—[D D N J F D C 193 April 1941]

**Praktal Electric Vaporizer**—Practical Products Company, New York. A kettle shaped electric vaporizing device. Misbranded because represented on label as a practical road to health and a remedy for asthma, bronchitis, laryngitis and whooping cough.—[D D N J F D C 186 April 1941]

**Premo Halibut Liver Oil Capsules Plain**—Gelatin Products Company, Detroit. Adulterated and misbranded because another fish liver oil had been substituted wholly or in part for plain halibut liver oil. Further misbranded because offered for sale under the name of another drug.—[D D N J F D C 174 April 1941]

**Premo Nasal Drops**—Premo Pharmaceutical Laboratories, New York. Composition not given. Misbranded because falsely represented as a relief of mucous inflammation and nasal catarrh.—[D D N J F D C 181 April 1941]

**Rodale Therapeutic Lamp**—Rodale Manufacturing Company, Emmaus, Pa. An incandescent bulb fitted into a reflector attached to a wooden handle. The label falsely represented that this was an effective treatment for colds, headaches, backaches, chest inflammation, rheumatism, lumbago and neuralgia and would do wonders for the health and invigorate the tissue.—[D D N J F D C 190 April 1941]

**Rogers Electric Vaporizer**—Rogers Electric Laboratories, Inc., Cleveland. An electric device for producing vapor which passes over cotton saturated with some medicinal agent. Falsely represented as an effective treatment of bronchitis, pneumonia, influenza and asthma.—[D D N J F D C 187 April 1941]

**Relievo Therapeutic Lamps**—Kas-Kel Electric Company, Inc., New York. A table model lamp equipped with an incandescent heating element. Misbranded because represented on label to relieve rheumatism, deep seated pains, mental and physical fatigue, congestion and some other things.—[D D N J F D C 194 April 1941]

**Slumber Ointment**—Nolan Company, Greenville, Pa. Composition mercuric nitrate (7.96 per cent), calcium and magnesium compounds, turpentine, soap and water in a fatty acid base. Adulterated and misbranded because it contained more than the 7 per cent of mercuric nitrate represented on the label. Further misbranded because falsely represented as a remedy for eczema, salt rheum, grease or rubber poisoning, boils, dandruff, varicose ulcers, warts and other skin disorders.—[D D N J F D C 171 April 1941]

**Sterno Vaporizer**—S. Sternau & Company, Inc., New York. A device to vaporize water and other liquids. Falsely represented as an effective treatment of coughs, sore throat, bronchitis, hay fever, whooping cough, catarrh, asthma and allied conditions.—[D D N J F D C 188 April 1941]

## Medical Examinations and Licensure

### COMING EXAMINATIONS AND MEETINGS

#### BOARDS OF MEDICAL EXAMINERS

##### BOARDS OF EXAMINERS IN THE BASIC SCIENCES

Examinations of boards of medical examiners and boards of examiners in the basic sciences were published in *THE JOURNAL*, July 4, page 830

#### NATIONAL BOARD OF MEDICAL EXAMINERS

NATIONAL BOARD OF MEDICAL EXAMINERS *Part I* Various centers, Sept 14 16 Exec Sec, Mr Everett S Elwood, 225 S 15th St, Philadelphia

#### EXAMINING BOARDS IN SPECIALTIES

AMERICAN BOARD OF ANESTHESIOLOGY *Written Part I* Various centers, Feb 4 Final date for filing application is Nov 6 Sec, Dr Paul M Wood, 745 Fifth Ave, New York

AMERICAN BOARD OF DERMATOLOGY AND SYPHILOLOGY *Oral Groups A and B* Cleveland, Jan 14 15, 1943 Final date for filing application is Dec 7 *Written* Various centers, Nov 16 Final date for filing application is Oct 5 Sec, Dr C Guy Lane, 416 Marlboro St, Boston

AMERICAN BOARD OF INTERNAL MEDICINE *Written* Oct 19 Final date for filing application is Sept 1 Sec, Dr William S Middleton, 1301 University Ave, Madison, Wis

AMERICAN BOARD OF OBSTETRICS AND GYNCOLOGY *Written Part I* Various centers Feb 13 *Oral Part II* May 1943 Sec, Dr Paul Titus, 1015 Highland Bldg, Pittsburgh

AMERICAN BOARD OF OPHTHALMOLOGY *Oral All Groups* Chicago, Oct 8 10 Sec, Dr John Green 6830 Waterman Ave, St Louis

AMERICAN BOARD OF ORTHOPAEDIC SURGERY *Oral and Written* Chicago, Jan 9 10 Final date for filing application is Nov 1 Sec, Dr Guy A Caldwell, 3503 Pryor St, New Orleans

AMERICAN BOARD OF PATHOLOGY *Oral and Written* Richmond, Va, Nov 9 10 Final date for filing application is Sept 1 Sec, Dr F W Hartman, Henry Ford Hospital, Detroit

AMERICAN BOARD OF PEDIATRICS *Written* Locally, Sept 18 *Oral* New York, Dec 5 6 Final date for filing application is Aug 1 Sec, Dr C A Aldrich, 707 Fullerton Ave, Chicago

AMERICAN BOARD OF PSYCHIATRY AND NEUROLOGY New York, December Final date for filing application is Oct 1 Sec, Dr Walter Freeman, 1028 Connecticut Ave NW, Washington, D C

AMERICAN BOARD OF SURGERY *Part I* Oct 7 Final date for filing application is Aug 22 Sec, Dr J Stewart Rodman, 225 S Fifteenth St, Philadelphia

AMERICAN BOARD OF UROLOGY February 1943 (tentative) Sec, Dr Gilbert J Thomas, 1409 Willow St, Minneapolis

### Wisconsin January Report

The Wisconsin State Board of Medical Examiners reports the written examination for medical licensure held at Madison, Jan 13-15, 1942 The examination covered 20 subjects and included 100 questions An average of 75 per cent was required to pass Twenty-six candidates were examined, all of whom passed Twelve physicians were licensed to practice medicine by reciprocity The following schools were represented

| School   | PASSED | Year Grad         | Number Passed |
|--|--------|-------------------|---------------|
| Loyola University School of Medicine                   |        | (1941)            | 1             |
| Northwestern University Medical School                 |        | (1926), (1941, 2) | 3             |
| University of Chicago, The School of Medicine          |        | (1939)            | 1             |
| University of Illinois College of Medicine             |        | (1941, 2)         | 2             |
| Indiana University School of Medicine                  |        | (1940)            | 1             |

### MEDICOLEGAL ABSTRACTS

**Dinitrophenol Blindness Attributed to Use of Drug —** The plaintiff's husband and wife filed a complaint against the Stanford University School of Medicine, Stanford University Hospital Lane Hospital, Board of Trustees of Leland Stanford Junior University and several individuals for damages for loss of the plaintiff wife's eyesight purportedly due to the negligence of the defendants. From a judgment sustaining the defendants' demurrers to the plaintiffs' complaint, the plaintiffs appealed to the district court of appeals, first district, division 1, California.

The complaint was predicated on fraud. It alleged that the defendants were in the business of manufacturing and distributing drugs designed and purporting to cure and relieve human sickness. By means of statements and articles caused by defendants to be printed in newspapers, pamphlets, circulars and medical journals the complaint continued, the defendants falsely stated and represented in effect that a certain chemical compound, commonly known as dinitrophenol, was a harmless drug which could be taken internally by human beings for the relief and cure of many illnesses and afflictions of the human body, and in particular that it would reduce excessive weight and alleviate obesity without causing physical illness or harm. It was then alleged that, as a matter of fact, the defendants well knew that such drug was dangerous, detrimental, poisonous and deleterious to the human body, was inherently dangerous to human life and limb and was liable to cause blindness. Large quantities of this drug, continued the plaintiffs, were manufactured by the defendants and distributed and dispensed throughout the state of California through the medium of wholesale and retail druggists and physicians. The complaint then alleged that the plaintiff wife having heard, read and believed the various statements said to have been published by the defendants, and relying on such statements and being ignorant of their falsity, purchased and took internally amounts of dinitrophenol for the purpose of reducing overweight and obesity, that she commenced to use the drug on about the 9th of March 1934 and continued taking it internally each and every day until and including the 30th of December 1934, and that by reason of the taking of the drug she became blind.

The defendants contended generally that the complaint did not set forth sufficient facts to entitle the plaintiffs to relief on the ground of fraud. Fraud is never presumed said the court; it must always be pleaded and established. Furthermore, the complaint should substantially show the representation of a material fact. The falsity thereof, the knowledge of such falsity or the making of a representation without sufficient knowledge, the intent to deceive or induce one to enter into a transaction, the participation of the defendant or defendants accused of the fraud, the belief in the truth of the representations, the reliance thereon and the consequent damages to the party or parties injured are essentials necessary to be specifically alleged or necessarily implied from the facts pleaded.

The court held that the present complaint was insufficient for a number of reasons. It did not allege whether the plaintiff wife took the drug on prescription, on directions, if any, given on the container or on any direction at all. These circumstances, said the court, should be alleged to apprise the defendants of the nature of the charge and to permit them to prepare a defense. The allegation that defendants were the manufacturers of the drug and gave directions for its use may be matters peculiarly within the knowledge of the defendants but whether plaintiff wife followed such directions is a subject on which the

defendants are entitled to be informed. It is material for them to know whether plaintiffs predicate the complaint for damages on the quantity, the dosage or the continuous use of the drug. Furthermore, the court continued, the complaint failed to allege how plaintiff wife, relying on the alleged published false statements and representations of the defendants that the drug was harmless, was induced to use or take the drug when it was alleged in the complaint that "the precise names and titles and exact contents and tenor of said publications" are "now unknown to plaintiff, and" are "now well known to defendants." The complaint failed to disclose whether or not the dinitrophenol advertised was the dinitrophenol manufactured by the defendants, whether or not the advertised dinitrophenol was the "certain chemical compound" which the plaintiff took internally for the purpose of reducing overweight and obesity or whether or not the dinitrophenol used by the plaintiff wife had been manufactured, sold, dispensed or distributed by the defendants. Neither was it clear whether the charge against the defendants was merely that they disseminated in printed matter false statements that the drug dinitrophenol was harmless when they knew it to be dangerous, or whether defendants were also charged with having manufactured and distributed the particular quantities or portions of the drug which the plaintiff wife took.

In conclusion, the court said that the defendants were entitled either to a direct allegation that the dinitrophenol manufactured, sold, dispensed and distributed by them was the particular dinitrophenol taken or allegations from which such fact may be definitely and reasonably ascertained. In the absence of sufficient allegations of causation between the alleged manufacture and distribution of the drug by the defendants and its use, the court of appeals held that no cause of action was stated. Accordingly, the judgment of the trial court sustaining the defendants' demurrers was affirmed. —*Wennerholm v Stanford University School of Medicine* 113 P (2d) 736 (Calif., 1941).

### Osteopathy Right of Blind Osteopath to Obtain License to Practice Minor Surgery and to Use Drugs —

The petitioner was licensed to practice osteopathy in the state of New York in 1919. He was then blind and he has remained blind ever since. His license authorized him to employ osteopathic procedures only, such as manipulation of the bones, manual manipulation, massage and passive exercises. In 1939 an amendment to the New York law was enacted under which an osteopath may obtain the right to use instruments for minor surgical procedures and to use anesthetics, antiseptics, narcotics and biologic products, if he satisfies the board of regents that he has received sufficient instruction and training to entitle him to the additional rights. Petitioner applied to the board for a certificate authorizing him to extend the scope of his practice as provided in the 1939 amendment. The board apparently permitted the petitioner to take an examination but refused to issue the certificate on the ground that the osteopath was blind and could not exercise the additional rights he sought. The supreme court, special term, ordered the board of regents to issue the certificate and the board appealed to the supreme court, appellate division third department.

The evidence showed that the written examination which the petitioner was permitted to take after applying for the certificate embraced the theory of narcotics, serology and endocrinology. No practical test in these subjects was given nor was any theoretical test given concerning minor surgical procedures. While the petitioner indicated by the examination which he took that he had adequate theoretical knowledge in the subjects in which he was examined, there is a great deal of difference said the court, between possession of theoretical knowledge and the use of this knowledge by actually performing surgery and injecting medical products into the human system. The court pointed out that medical students before being permitted to practice medicine in New York must spend at least four years

in a medical college. During that time they observe many operations performed, thus gaining much knowledge and information from the ability to observe how things are done. This the petitioner could not do because of his blindness.

Anesthetics, the court continued, consist in the administration of such compounds as ether, nitrous oxide and cyclopropane, which are highly inflammable and dangerous in character. Many substances are administered as local anesthetics, usually hypodermically, and the appropriate site in the patient's anatomy must be selected by the person administering them. Furthermore the anesthetist must continuously observe the condition of the patient, since too much anesthesia may be fatal and too little may be ineffective. A blind man, concluded the court, cannot safely administer anesthetics. Regarding antiseptics, the court said that it was familiar with the effects of the overuse of iodine on some skins, the susceptibility of the epidermis of certain human beings to a particular antiseptic. Whether a particular antiseptic may be safely used on a patient depends on the ocular observation of the person administering it.

Under the law the board of regents had discretionary authority, the court said, not to grant the certificate. The law uses the word "may," indicating that even though the applicant passes the examination and meets the other statutory requirements the regents may still exercise a discretion as to whether a certificate should be issued. In this case, the court thought there was no abuse of discretion. The refusal of the board to issue the certificate was therefore affirmed—*Application of Marks*, 27 N Y S (2d) 739 (N Y, 1941).

**Malpractice Liability of Dentist for Injury to Patient Under Influence of Nitrous Oxide**—A patient went to the office of the defendant dentist to have two teeth extracted. Nitrous oxide was administered for several seconds and then procaine was injected. While waiting for the procaine to take effect, the defendant attended a patient in an adjoining room. Returning he gave the plaintiff patient another injection of procaine and again left the room, this time for about twenty minutes. When he returned the second time, he extracted the two teeth after administering more nitrous oxide. After the extraction, the defendant again left the room, the patient still being under the influence of the nitrous oxide. Shortly thereafter, and before the defendant returned, the patient fell through a window to the sidewalk 25 feet below and sustained such serious injuries that he did not regain consciousness until about three weeks later. In subsequent suits by the patient and his father the trial court directed verdicts for the defendant, and the plaintiffs appealed to the Supreme Judicial Court of Massachusetts.

Certain evidence that was offered by the plaintiffs through a practicing dentist to show the effect on a patient of the inhalation of nitrous oxide and the difference between its effect and the effects caused by ethyl chloride, which the witness had used for twenty-five years because the latter was in his opinion safer, was excluded by the trial court. The witness, who had not used nitrous oxide for twenty-five years, was not permitted to testify as an expert witness on the ground that he did not have the necessary qualifications. The Supreme Judicial Court did not think the trial court erred in refusing to admit this testimony. Except in rare instances where, as a matter of law, the exclusion of proffered testimony would be unwarranted, the preliminary question of the qualification of a witness called as an expert rests with the trial court. In view of the fact that the proffered witness had not used nitrous oxide for over twenty-five years, the court pointed out, it could not be said that in refusing to admit the testimony there was any abuse of discretion.

The defendant dentist testified at length with respect to the use of nitrous oxide in the extraction of teeth and the effects of its inhalation by patients. He testified in substance that he intended to administer only enough nitrous oxide to bring about a state of analgesia, that he knew if he administered more than was needed to produce such state the patient's reflexes and his

nerves would be in such a condition that he would have no control over them and that a dentist must guard against the unexpected conduct of persons coming out of this condition, referred to by the dentist as a "quick drunk." He testified further that there was a nurse at all times in the room with the patient who had been employed in the dental office for about a year. This nurse, however, the dentist testified, did not have any special training and had never attended any school to qualify her as a dental assistant. In the opinion of the appellate court had the case been submitted to the jury, it could have found that the defendant left the office in which the patient was operated on, after extracting the teeth, and did not return before the patient fell or leaped through the window. The jury could also have found that the patient was in fact rendered unconscious or semiconscious by the nitrous oxide and that he was in that state when the defendant left the room after extracting the teeth. In the opinion of the court, the jury was competent to pass on the question of whether the defendant was negligent in leaving the unconscious or semiconscious patient in the care of a nurse who was without special training. Whether or not the defendant was negligent and whether his negligence bore a causal relation to the patient's injuries presented issues that should have been submitted to the jury. The court, therefore, held in effect that the trial court erred in directing the verdicts for the defendant—*Langis v Danforth* (two cases), 33 N E (2d) 287 (Mass, 1941).

**Workmen's Compensation Acts Death from Overdose of Narcotics Following Industrial Injury**—On Dec 6, 1939 the deceased received serious injuries as the result of an accident arising out of and in the course of his employment with the defendant. He was disabled and suffered intense pain from then until December 21, when he was found dead in his bed. Subsequently the claimant filed a petition for compensation on account of the death and obtained an award in her favor from the Florida industrial commission. This award was affirmed by the circuit court, and the defendant and its insurance carrier appealed to the Supreme Court of Florida, Division A.

The record showed that the deceased suffered such pain in the abdominal region that the physician furnished by the employer prescribed a narcotic to alleviate the pain and that the death may have resulted from an overdose of the narcotic. It is clear, said the Supreme Court, that there was a direct causal connection between the injury and the death, even if death followed as the immediate result of taking the narcotic. The taking of the narcotic was not an independent intervening cause but was the result of the injury, and the employer and insurance carrier are liable under the workmen's compensation act. Aside from this, said the Supreme Court, we are not convinced from the record that death was not the direct result of the injury without being superinduced by the taking of the narcotic. There was ample evidence, in the opinion of the court, to cause reasonable men to reach the conclusion that the deceased received more serious internal injuries than had been identified and that in all probability, death was the direct result of the injury. The order of the industrial commission was accordingly affirmed—*City of Lakeland v Burton*, 2 So (2d) 731 (Fla, 1941).

## Current Medical Literature

### AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1932 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (\*) are abstracted below.

**Laryngotracheobronchitis**—During 1939 and up to July 1940 241 patients, 16 (6.5 per cent) of whom died were admitted to the croup wards of the Willard Parker Hospital. For some patients with a severe type of disease sulphyridine or sodium sulphyridine was used in addition to the general procedure followed in treating 217 similar patients during 1937 and 1938. Of the 17 patients for whom intubation was indicated and chemotherapy was used 3 died. The 43 patients who underwent tracheotomy were given chemotherapy as a routine measure. The chemotherapeutic agent seemed to have been least effective in these cases as the mortality was 25.8 per cent. Complicating pneumonia developed in 29 cases with 7

deaths, a mortality of 24 per cent. During 1937 and 1938 when the 217 patients were treated by palliative measures there were 23 deaths, or a mortality of 10.5 per cent. Among the 34 for whom intubation was necessary there were 12 deaths, a mortality of 35.8 per cent. Tracheotomy was necessary for 28, of whom 7 died, a mortality of 25 per cent. Twenty-nine contracted either bronchopneumonia or lobar pneumonia, and of these 12 or 41.3 per cent, died. An analysis of the observations on the patients who died, Graebner concludes, indicates that chemotherapy is of value in suitable cases in which the predominating organism is amenable to the drugs and the physical resistance of the patient has not been too greatly exhausted.

**Bismuth Therapy of Tonsillitis**—Bacterial smears of mucopurulent material aspirated from diseased tonsils frequently, Lewis points out, show many fusospirochetal organisms, while smears made from swabs of the same tonsils reveal only a few organisms. He believes that the usual textbook picture of Vincent's angina calling for many organisms in smears from ulcerated and membranous tonsils is too exclusive, as he has encountered many cases of follicular tonsillitis in which the presence of the fusospirochetal organism seemed to be more important than ulceration and membrane formation. Vincent's organisms, able to thrive under anaerobic conditions, are found in considerable numbers in chronically inflamed gingival pockets. They are predominant in smears of aspirated material in many cases of chronic tonsillitis in children. This suggests that these organisms produce chronic inflammation and hypertrophy of the tonsils. Thus the Vincent organism in crypts may produce chronic inflammation and swelling which closes off the mouths of the crypts and creates anaerobic pockets favorable to its growth. The organism can become invasive, especially when a locus minoris resistentiae is presented by trauma, mercury or bismuth intoxication, malnutrition, abnormal dental conditions or primary invasion by some other organism. Gingivitis and tonsillitis are frequently concurrent in children undergoing second dentition, when the element of trauma is at its highest. Fusiform bacilli and spirochetes play an important role in acute, as well as in chronic, tonsillitis. The author frequently encountered cases of acute tonsillitis with more or less evidence of active fusospirochetal infection in the winters of 1938-1939 and 1939-1940, and less frequently in 1940-1941. Forty patients with acute tonsillitis with evidence of tonsillar fusospirochetal infection usually showed prompt improvement when arsenicals or bismuth injections were given. Bismuth was more effective and whether its effectiveness was due to its streptococcicidal and/or fusospirocheticidal activity bismuth is highly effective for most types of acute tonsillitis. It was ineffective for pneumococcal nasopharyngitis.

Role of the Pathologist W J Deadman Hamilton Ont.—p 365  
Circoid Aneurysm Affecting Auditory Auricle A A Kila's Winnipeg Man.—p 370

**Genitofemoral Causalgia**—Magee describes a heretofore unrecognized syndrome characterized by pain and paresthesia of the genitofemoral nerve. The pain which usually follows appendectomy, is aggravated by walking and by hyperextension

of the hip. Two of his 7 patients referred the pain to other pathologic processes. In the year since the first case was seen, 7 have been recognized. In 5 cases the nerve was resected and a complete cure was obtained. The author believes that the condition is common and that it is often misdiagnosed as neurosis or malingering.

**Arsenotherapy in Early Syphilis**—Thirty-six patients with primary or early secondary syphilis, i. e., within four or five months of the inception of the disease, were treated by Usher and Hill with the continuous intravenous drip of mapharsen. One woman was treated again because of a persistent positive Wassermann reaction at four months and 1 man was treated again for a reinfection. Almost all the patients suffered from nausea, vomiting and pain up the arm, 27 had fever toward the end of the first day and a few a low grade fever which persisted throughout the course of the treatment. Five patients had toxic erythema, 3 had paresthesias of the hands and feet, 1 had purpura of the extremities and 1 encephalopathy associated with convulsions and disorientation. There were no instances of exfoliative dermatitis, renal, hepatic or other parenchymal damage, nitritoid crisis or blood dyscrasias. Many of the patients were transients or members of the merchant marine, 7 followed for a minimum of three months have a negative blood Wassermann reaction, 3 have been lost from observation and the status of the others is uncertain. Those who were negative remained negative, while those who were positive became negative within two months. Eight or ten months may elapse before a complete reversal of the serologic state in those with secondary syphilis takes place.

**Postanesthetic Complications**—An analysis by Campbell and Gordon of the anesthetics of 2,094 patients during one year in all the services of a military hospital disclosed that the incidence of pulmonary complications was definitely increased by an active or recent respiratory infection, no matter what anesthetic agent was used. Pulmonary complications following operation on the upper part of the abdomen were decidedly higher than after other types of operation with the same anesthetic agent. Likewise the incidence was higher among patients who had endotracheal intubation than among those who did not. Postanesthetic complications following spinal anesthesia and cyclopropane for the repair of inguinal hernia were not significantly different in the presence of active or recent respiratory infection. In patients with no such history the complication for cyclopropane anesthesia was much less than that for the spinal anesthetic agents. The addition of a supplemental inhalation agent to spinal anesthesia increased the incidence of postanesthetic pulmonary complications.

**Kenny Treatment**—Lewin states that the Kenny treatment for poliomyelitis is one of the most noteworthy advances in orthopedic surgery. Careful observation of Miss Kenny or her trained personnel in treating patients with infantile paralysis suggests that continuous rigid splinting is not only "on its way out" but that it is "out." According to Miss Kenny there probably is no such entity as paralysis of an individual muscle. If her theory of intercostal muscle spasm is accepted, the use of the respirator in the disease may be harmful. After nearly two years of follow-up study on 54 cases treated in the Minnesota hospitals by Kenny or by her trained assistants, the medical observers state that they have observed complete recovery of the muscles of the trunk, abdomen, back and neck. The

frequent residual deformities have not been observed in a definite proportion of cases as they have been in cases treated by other methods. The marvelous aspect of the Kenny treatment is the fact that a child with infantile paralysis can be given the treatment in a farm house—especially during the first seventy-two hours of the illness when the hot fomentations afford their greatest relief from pain and stiffness. Miss Kenny has jarred the medical and allied professions out of their complacency into an immediate offensive attack on the local condition which she has proved exists.

**Histoplasmosis of Knee**—As far as Key and Large could determine, none of the cases of histoplasmosis reported in the literature involved joints or muscles as it did in their case, in which sections from the specimen of the knee joint showed the typical *Histoplasma capsulatum* of Darling. The case closely resembled tuberculosis of the knee joint and was so diagnosed until it was found that the guinea pig inoculation and the tuberculin test were negative. It was then thought to be a low grade infection of unknown origin. The limb was amputated, the sutures were removed on the seventh postoperative day, two days later the patient became stuporous and cyanotic, the neck became rigid, ankle clonus developed, a diagnosis of pneumonia of the right lower lobe complicated by right heart failure and meningismus was made and the patient was placed in an oxygen tent and given sodium sulfathiazole intravenously, but he died the following day. Necropsy was refused, and the true diagnosis was not suspected until the microscopic sections of the synovial tissues of the knee were examined. The authors report their case because they feel that, if Meloney's predictions come true other cases will appear and that other clinicians may make similar mistakes.

**Osteochondritis Juvenilis of Acetabulum**—Lipscomb and Chatterton report what they believe to be the second presentation in the literature of juvenile osteochondritis of the acetabulum. They believe that the acetabulum is involved much more often than is generally recognized, either with the head of the femur or alone. To substantiate this view they report 3 cases in which the acetabular structure was involved without obvious involvement of the neighboring head of the femur and 2 cases in which the acetabulum was involved in conjunction with the femoral head and other centers of ossification. Treatment is conservative and should relieve the strain which results in weight bearing. Healing without deformity took place in 2 cases.

**Bone and Joint Tuberculosis**—Harris and Coulthard attempt to determine the present status of the 307 patients with bone and joint tuberculosis treated in the Toronto Hospital between January 1931 and December 1940 and the influence the prognosis. It was possible to follow up 200 cases.

for one to ten years. These 296 patients had three hundred and fifty six lesions of bones, joints and associated structures. When the results obtained are analyzed irrespective of the therapeutic measures adopted, it becomes apparent that several factors influence the prognosis adversely: the presence of multiple tuberculous foci and the presence of organisms other than tubercle bacilli in any of these foci. More than one third of the patients had only one tuberculous focus. The percentage of arrested disease and the ability to return to work of these patients was high, especially those with tuberculosis of the spine (80 per cent) and of the knee (100 per cent). The mortality rate was 13 per cent and was usually due to secondary osseous infection or to nontuberculous disease. A fourth of the patients had additional tuberculosis in other bones and/or in the genito-urinary system but not in the lungs. Treatment has to arrest tuberculosis throughout the body, and often more than one operation is required. The incidence of these patients' return to work was much reduced and the mortality rate rose to about 20 per cent because of the appearance of meningitis and of Addison's disease in addition to chronic suppuration and nontuberculous disease. More than 40 per cent of the patients also had pulmonary tuberculosis, the most serious complication. When combined with other skeletal and renal foci the prognosis is much worse than when pulmonary tuberculosis is the only complication, the incidence of arrested disease and of return to work among the latter patients was between 40 and 50 per cent and between 12 and 20 per cent for the former, and the respective mortality rates were 38 and 44 to 80 per cent. The principal causes were miliary tuberculosis, meningitis and pulmonary tuberculosis. Tuberculosis of the spine was arrested in 88 per cent of the patients treated by spine bone graft, but in 26 per cent arrest of the systemic disease was delayed or prevented by tuberculosis elsewhere in the body. The best results were obtained by rest and the control of other tuberculous foci and then by operation to secure bony ankylosis of the affected joint.

**Tocopherols in Treatment of Primary Fibrositis.**—Various chemical combinations, physical forms and routes of administration of the tocopherols were tried by Steinberg for the treatment of patients with primary fibrositis. From 120 to 240 mg of a molecular distillate of tocopherol was given daily to 20 patients with primary fibrositis. Definite improvement was observed by all. Forty other similar patients were given 300 mg of the preparation for one week and then 150 mg. Most of these patients improved after one week of treatment, and all but 5 were completely relieved of their fibrositic symptoms. These 5 patients were relieved from pain, but not completely from generalized stiffness. Nine patients with primary fibrositis were given 334 mg of mixed tocopherols intramuscularly at weekly intervals for three weeks, all had severe local reactions, 2 had systemic reactions, but all were definitely relieved of their fibrositic symptoms and the fibrositic nodules of 1 patient disappeared. All of 12 patients given 200 mg of synthetic alpha tocopherol in corn oil intramuscularly at weekly intervals and observed for two to four months were also definitely relieved. The injection route was tried in 4, 0.3 cc of 40 per cent solution of the molecular distillate was rubbed into the skin daily. These patients were observed for two months, they objected to the odor of the drug, and the results were poor. Two salts of the tocopherols were given 22 patients with various muscle disorders. The fibrositis was completely relieved of 9 of 12 patients who received 0.065 Gm of alpha tocopherol succinate in capsules by mouth three times daily. 1 with secondary fibrositis obtained no relief nor did 2 with psychosomatic rheumatism. Of 10 others with fibrositis receiving 0.065 Gm of gamma tocopherol palmitate three times daily by mouth 6 were completely relieved and 2 had some relief, 1 with combined sclerosis complicating pernicious anemia and 1 with osteitis deformans had no relief. The results indicate that either the oral or the parenteral route is equally efficacious. The striking similarity between the pathologic changes of primary fibrositis and nutritional muscular dystrophy plus the clinical improvement obtained in both conditions with tocopherols indicate that primary fibrositis is a metabolic disorder concerned with the deprivation of vitamin E.

**Desoxycorticosterone Acetate and Sodium for Addison's Disease.**—During the last two and a half years McGavack treated 6 cases of Addison's disease with desoxycorticosterone acetate, together with regulating the sodium and potassium intake. He concludes that the patient with Addison's disease can be satisfactorily maintained in good health with desoxycorticosterone acetate and the simultaneous regulation of the intake of sodium and potassium and that within certain limits a reciprocal relation exists between the amount of sodium

to be ingested and the dose of desoxycorticosterone acetate necessary to maintain the subject in a state of well being, a slow, steady gain in weight or the maintenance of an attained normal weight, a return and stabilization of a normal blood pressure and the maintenance of normal values for sodium and potassium in the blood and urine and improved dextrose tolerance curves. Patients felt best and showed most nearly normal carbohydrate utilization on 10 to 20 mg of desoxycorticosterone and sodium daily. Patients receiving less than 5 mg of desoxycorticosterone daily and more than 9 mg of sodium daily did not "feel fit," despite the maintenance of normal weight, blood pressure and serum electrolytes.

**Acetarsons Tampons for Trichomonas Vaginitis**—Meigs used tampons infiltrated with acetarsone to treat 39 cases of *Trichomonas vaginitis*. The tampons are made by dusting each with  $1\frac{1}{2}$  grains (0.1 Gm) of acetarsone, in addition a tablet containing  $\frac{1}{2}$  grain (0.032 Gm) of acetarsone, 2 grains (0.13 Gm) each of dextrose, lactose and boric acid,  $\frac{1}{2}$  grain of starch,  $\frac{1}{4}$  grain (0.016 Gm) of sodium bicarbonate and  $\frac{1}{10}$  grain (0.025 Gm) of tartaric acid is placed on top of each. The pH of the solution of this tablet is approximately 3. Acetarsons powder is first insufflated and then the medicated tampons are used at home every night for the first week and removed in the morning. At the end of a week a warm douche of sodium perborate (1 tablespoon to a quart of warm water) is taken. During the next week the tampons are inserted every other day, and during the following week they are used every third day, the weekly douches are repeated. This is continued until the next menstrual period. The medicated tampons are used throughout the period, but after it the treatment is omitted for a few days and a smear is taken, and if it is positive treatment is repeated. If the smear is negative the patient uses a tampon twice a week, with a sodium perborate douche at the end of the week. If after the next menstruation the vagina is still free from organisms, treatment is stopped. Of the 39 patients treated 19 were permanently cured, 7 were symptomatically relieved, 7 were not sure whether the treatment was beneficial and 6 thought it was not.

**Pharmacodynamics of Sulfadiazine in Man**—The pharmacodynamics of sulfadiazine were studied in 98 men who had infection of the upper part of the respiratory tract or who were convalescing from pneumonia. Ratish and his associates gave the drug orally, intravenously, subcutaneously, intramuscularly and rectally and determined the fate of single oral doses of 2, 3 and 5 Gm and of repeated doses of 1 Gm every four to six hours. Sulfadiazine was readily absorbed from the gastrointestinal tract and with it a generally higher concentration was obtained in the blood than with similar doses of sulfapyridine and sulfathiazole. Sulfadiazine disappeared from the blood more slowly than either of the other two drugs. The amount conjugated in the blood was less than that with sulfapyridine or sulfathiazole. The conjugated fraction in blood and urine did not increase with continued administration. About a third of the dose given was conjugated in the urine, although in exceptional cases a much larger proportion may be so excreted. Its rapid urinary excretion may account for the small quantity conjugated in the blood. When both rapid attainment and maintenance of high blood levels are desirable and oral administration is not feasible, the intravenous infusion of sodium sulfadiazine is practical. Sulfadiazine was widely and readily distributed in body fluids. It penetrated well into the pleural and peritoneal cavities. Its concentration in the spinal fluid was usually about two thirds of that in the blood. With initial doses of 2, 3, 4 and 5 Gm followed by 1 Gm every six hours the levels obtained were similar to those reached when the drug was given every four hours. The concentration in the blood

was independent of the total and the per kilogram of body weight dose. The incidence of toxic reactions was less with sulfadiazine than with sulfapyridine and sulfathiazole. When they did occur they were mild.

**Joint Suppuration, Pyogenic Osteomyelitis**—The data on 57 patients with sixty-seven suppurative joints encountered in two hospitals during a period of eight years analyzed by Blaisdell and Harmon emphasize the need for early and precise bacteriologic diagnosis by joint aspiration so that specific chemotherapy

therapy may be instituted immediately. Prolonged application of traction to the involved extremity to minimize ankylosis and the value of specific chemotherapy during the acute stage are stressed. Of the 57 patients 7 died, 25 had chronic osteomyelitis and/or ankylosed joints with draining sinuses 5 were improved (the wound healed, but occasional discomfort remained) and 20 were cured (2 by amputation). These results are poorer than would be obtained under modern chemotherapy, since it aids in controlling suppuration, allowing elective and reconstructive operations and sterilizing the blood stream if involved. In the acute cases deformity was prevented by fixation in the positions of maximal function. Many patients were not seen until long after the acute onset. These patients, for the most part had retained deformities which under proper supervision could have been minimized or prevented.

**Testicular Biopsy to Determine Fertility**—Charny and Meranze performed ninety-five testicular biopsies to determine the nature of the intrinsic lesion causing reduced fertility. The series includes instances of testicular underdevelopment resulting from a congenital endocrine imbalance and testicular degeneration of a normally developed testis brought about by inflammation, toxic processes or postpubertal endocrine disturbances. These two lesions can be differentiated by the data obtained from testicular biopsy. The differentiation determines the prognosis and type of treatment. The ninety-five biopsies revealed two pathologic changes varying considerably in degree: intratubular, in which the degenerative or developmental lesion was confined to the seminiferous tubules, and peritubular, in which peritubular fibrosis either inflammatory or replacement was seen in addition to the intratubular lesion. Sixteen of the biopsies showed normal spermatogenesis, fifty-one showed moderate to severe peritubular fibrosis and twenty-eight showed a normal amount of peritubular connective tissue despite damage to the tubular epithelium. The pathologic changes confined to the tubules varied from simple desquamation of the innermost layer of cells the spermatids, to more severe degenerative changes in which both the spermatocytes and spermatogonia were involved or, finally, to a stage in which the tubule consisted of merely a single layer of undifferentiated cells apparently incapable of growth and division. The peritubular fibrosis was indicative of either the end stage of an inflammatory process or of a severe degenerative process which produced, in addition to epithelial damage, an infolding and thickening of the membrana propria, a shrinkage of the tubules and subsequent replacement fibrosis. The presence or absence of peritubular fibrosis was a most valuable differentiating finding: fibrosis was not observed in any clinical entity associated with underdeveloped testes. Such testes showed tubules smaller in size than normal and lined by incompletely developed or undifferentiated epithelial elements. On the other hand, the acquired degenerative lesion almost invariably showed some degree of peritubular fibrosis. Exceptions apparently occurred in mild cases of tubular degeneration and in extremely acute instances which did not represent end stages such as injury from diethylstilbestrol. Such cases illustrate the regenerative potentialities of the testes when the toxic agent is removed or a stimulating remedy is introduced. Testosterone propionate produced degeneration of the seminiferous tubules in a hypogonad in whom androgen therapy was indicated according to the present concepts. Most men with reduced fertility who are almost routinely treated with some endocrine product present no clinical evidence of endocrine disturbance or endocrinopathy when studied by the available laboratory procedures. Therefore there is no justification for concluding that there is an isolated endocrine dysfunction of the seminiferous tubules. Most of these testicular lesions are degenerative and are usually due to local or distant inflammatory or toxic processes. Since no endocrine imbalance exists, the lesion cannot be expected to respond to endocrine therapy.

**Steel Wire as Suture Material**—Pratt implanted some seven hundred and fifty sutures of different materials (no 1 catgut, chromic no 1 catgut, silkworm gut, alloy steel wire, silver wire, dermal and various types of fishline) in surgically prepared areas in 125 cases to learn the reaction to these

materials. Microscopic, bacteriologic and at times pathologic observations were made at intervals of five, seven, ten and fourteen days. Steel wire sutures showed the least tissue reaction. For the last eight years the author has used steel wire exclusively for retention and cutaneous sutures with success in all abdominal and other wounds. It has been buried in the closure of fascia in inguinal and all ventral or incisional hernias. It has been particularly successful in the presence of sepsis and its efficiency has permitted primary closures in appendicitis with peritonitis, in colostomies after the first stage of the Mikulicz operation and in fistulas. It has replaced all other sutures in plastic operations.

**Complications of Radiotherapy in Cancer of Cervix**—Cutler divides complications of cervical radium and roentgen therapy for cancer into the avoidable, which result from incorrect irradiation, and unavoidable, which occur in spite of apparently correct irradiation. To eliminate avoidable complications the basic principles of radiation therapy must be understood. An exactly similar treatment is not suitable for all cases, but certain generalizations can be applied to certain groups of cases. The radiation treatment of cervical cancer is intracavitary and extracavitary. As a rule the two procedures are combined, or one or the other method may be used exclusively. Occlusion of the cervical canal by cancer renders intracavitary irradiation difficult and sometimes impossible. The danger of perforation in an effort to locate the cervical canal can be avoided by initiating treatment with external and vaginal radiation which will cause the lesion to regress and will diminish or eliminate infection—the most important of all complications. Other complications, most of which are avoidable, are early injury to the cutaneous and subcutaneous tissue and edema. Epidermite can be avoided by protracting the total treatment to five or six weeks. Edema indicates that the normal tissue cannot tolerate the intensity of the radiation administered. Difficulties can be eliminated by avoiding the single massive dose. Injury to the bladder is uncommon if treatment is not faulty. The proximity of the rectum to the radium foci placed against the cervical lesion exposes it to possible radiation injuries. The first and mildest reaction of the rectal mucosa to irradiation consists of a watery diarrhea without abdominal pain. It indicates that the level of tolerance has been reached. This reaction requires that the size of the skin port be reduced. If the reaction becomes more severe, irradiation is too intense and the daily dose must be reduced, the size of the field diminished or treatment discontinued for several days or longer. Late sclerosis of the pelvic tissue may occur years after intensive irradiation. Pyometra with peritubal edema and diffuse parametrial inflammation may simulate a local recurrence. Mild palliative irradiation was given several patients for suspected late parametrial recurrence and the patients were discharged with an apparently hopeless prognosis, but several years later information was received that these patients were alive and well. There can be little doubt that these were examples of pelvic sclerosis. For postirradiation intestinal obstruction, a rare but important result of benign stricture of the intestine, laparotomy is warranted. Activation of latent hemolytic streptococci is a real danger and is associated with 1 to 2 per cent mortality. Since the advent of the sulfonamides, reports have appeared in the literature indicating that they are valuable in treating infections.

**Fourth Type of Erythroblastosis Fetalis**—Three cases of a fourth type of erythroblastosis fetalis, not described previously, in which hydramnios is common and intrauterine death occurs some time before delivery, are reported by Henderson. Fetuses of this type show little or no edema, are severely macerated and have a diffuse hepatic cirrhosis and splenomegaly. The pale pink placenta is greatly enlarged. The pronounced hepatic cirrhosis proves that erythroblastosis may have a long intrauterine course. This type of the disease bears a close superficial resemblance to congenital syphilis, but close examination of the fetus and placenta renders differentiation easy. Fetal and neonatal erythroblastosis is not generally recognized. The more severe types are still usually regarded as congenital syphilis, and the unfortunate mothers are condemned as syphilitic in spite of negative serologic reactions. The relative frequency of this type of erythroblastosis is difficult to determine, as the affected fetuses are often not examined. It may be more common than either hydrops fetalis or anemia hemolytica.

**Effect of Vitamin C on Health**—Glazebrook and Thomson discovered a pronounced difference between the degree of vitamin C saturation of students 15 to 20 years of age in a large training school and the teaching staff. The students were given a high calory diet subjected to prolonged heating, which resulted in a reduction of the total daily vitamin C intake to a level of 10 to 15 mg per person. A daily addition of 50 mg of ascorbic acid per person was required to maintain an optimal excretion level. Better distribution and cooking of the food might have achieved the result. The daily potato ration alone, allowing for normal cooking losses, should have supplied at least 25 mg of vitamin C. Some vitamin loss is unavoidable when food is cooked in a central kitchen for large groups of persons. Normally this can be easily counteracted by supplying uncooked fresh or canned food. The dietary of the teaching staff included the supply of fresh fruit at each of the main meals. It was prepared in separate kitchens and escaped overcooking. Nevertheless, 25 per cent of the staff were "deficient" in vitamin C, in spite of their adequate intake. Approximately 4,000 mg of vitamin C was required to produce tissue saturation in the youths. A record of the incidence of infectious diseases revealed that the incidence of the common cold and of tonsillitis was the same among the general group and a group given vitamin C, that the average duration of illness due to the common cold was the same in the two groups and that rheumatic fever and pneumonia occurred among the general students but not among the special group given vitamin C.

**Sulfonamide Compounds and Acute Rheumatism**—In an institution for boys during an epidemic of tonsillitis (2,000 cases) and acute rheumatism (115 cases), every fourth patient admitted to the wards with tonsillitis was treated by Glazebrook and Thomson with 15 to 20 Gm of sulfanilamide over a period of four or five days. Of 16 cases of acute rheumatism observed for six months, 4 occurred in the group whose preceding tonsillitis had been treated with the drug and 12 occurred in the group whose preceding attack was not so treated. Four of the patients in the control group gave a history of a previous attack of acute rheumatism. Many hemolytic streptococci were cultured from throat swabs of 4 patients of the test group and from 6 of the control group during the attack of tonsillitis. Two cases of otitis media and 1 of streptococcal pneumonia developed. The drug was not in the controlled experiment but sulfonamide therapy was administered. Rheumatism developed in these 3 patients as a complication.

## Lancet, London

1 281-312 (March 7) 1942

- Continuous Method of Drying Plasma and Serum J F Wilkinson, K Bullock and W Coven—p 281

\*Meningococcal Endocarditis J G Cutts, G Kraft and P H Walker—p 292  
Hereditary Tendency to Hernia P Evans—p 293

**Mental Reactions to Air Raids**—Psychiatric casualties following aerial bombardment have been less than expected. Wilson reports that of 697 civilian patients brought to the first aid post 134 were suffering from acute emotional disturbance, hysterical paraplegia and stupor due to fright and anxiety. All left the hospital within twenty-four hours and only 6 returned. They were all told that their reaction was due to fear, which is shared by all persons, and that it was important that they should return to their normal work and resist the temptation to exaggerate the experiences through which they had passed. The psychopathic traits of 63 patients suffering from psychiatric symptoms due to air raid stress were two and a half times as frequent as those of 102 nonservice normal patients taken at random from the surgical outpatient department of the same emergency medical service hospital. The controls were far more conscious of the fear excited by aerial bombardment than the psychiatric patients. Shelter phobia was present in 15 of the 102 controls. The admission and acceptance of fear is a safeguard against breakdown under acute stress. Total denial of fear is a poor prognostic sign. The anxiety that requires attention at the first aid post may be aided by dispelling fear by reassuring the outpatients that their reaction is natural. For conversion symptoms—dyspepsias, inframammary pain and head aches—it is probably important to convince these patients at the first session of the obvious connection between the symptom and the acute danger or terror. When any service must recruit persons with anxieties, reasonable timidity and anxiety should be allowed if it is associated with those opportunities of corporate responsibility and wholesome competition which strengthen individual morale. To prevent hysteria, civilian defense workers must have the capacity for arduous work.

**Meningococcal Endocarditis**—A case of meningococcal endocarditis that responded to treatment with the sulfonamides is reported by Cutts and his collaborators. In the nine months that the patient was ill he received 90 Gm of sulfanilamide, 130 Gm of sulfapyridine and 560 Gm of sulfathiazole. The drug controlled the daily intermittent fever, which rose to 101 F. Each time the sulfonamides were withdrawn it again rose. The recurrences indicate the lethal effect of the drug on the circulating organisms and their failure to overcome the defense of origin on the heart valves. The sulfonamides were given with some anxiety lest renal complications ensue. Sulfapyridine had the most depressing effect on the patient but sulfanilamide did not upset him and he took this drug continuously for two weeks without a complaint.

—p 319  
Tellurite Medium in Diagnosis of Dysentery J C S Thomas and  
W A Hulme—p 321  
\*Gastric Disorders in the Army J M Smellie—p 322

**Digestibility of National Wheatmeal**—Krebs and Mellanby determined the digestibility of the national wheatmeal or white flour of 75 per cent extraction in 6 adult male volunteers who consumed 480 to 700 Gm of bread made from these flours. The dry weight and nitrogen content of the feces were determined. On the average 94 per cent of the dry matter and 97 per cent of the nitrogen of national wheatmeal were digested. In the case of white flour of 75 per cent extraction approx 97 per cent of dry matter and 91 per cent of the nitrogen were digested. The views put forward by Wright against raising the extraction of wheat to 85 per cent are not substantiated by the new data. The difference in the digestibility of the two flours is much smaller than Wright assumed.

**Gastric Disorders in the Army**—According to Smellie from Nov 1, 1940 to Oct 31, 1941 1,686 cases were admitted to the medical division, and indigestion was the leading complaint of 247 131 of whom had definite organic gastric or duodenal disease and were invalided from the service as permanently unfit. The remaining 116, after investigation and a short course of treatment were returned to duty. Thus organic dyspepsia was present in 77 per cent of the total medical cases. When a diagnosis of ulcer has been established in a soldier he should be invalided from the army and immediately returned to civilian life where rest, diet and tranquillity of mind are possible. Before enlistment these patients were leading useful lives in the service of their country and should be returned to such service. In the army they remain a burden to themselves and to others. So far as possible they should be investigated as outpatients. The segregation of soldiers suffering from dyspepsia is detrimental to their interests, for such advantages as accrue from organized management far outweigh the adverse reactions on the individual. Segregation makes symptoms spread and the return of the soldier with a mild, simple and functional disorder to duty much more difficult, they think they are being victimized.

**Tests of Hepatic Deficiency**—The effectiveness of the hippuric acid excretion as a test of hepatic function was determined by Henderson and Splatt on 89 patients with hepatic disease, 86 with various other disorders and 25 normal adults or patients convalescent from minor surgical conditions. The results were compared with the Takata-Ara reaction in 143 patients with disease of the biliary tract and in 50 normal subjects. In no case was there any grave discrepancy between the results of the hippuric acid excretion test and the operative observations or the necropsy. The test is not reliable when the kidneys fail to excrete nitrogenous metabolites, but this difficulty seldom arises in practice, and furthermore in doubtful cases the estimation of the blood urea content and of the urea clearance or concentration would detect such errors. Besides lowered function of hepatic disease and congestive heart failure the test revealed impaired function in certain conditions in which toxic changes are widespread, as in pulmonary tuberculosis, pernicious anemia and rheumatoid arthritis. As with the hippuric acid test the liver is called on to make an effort

well beyond the normal physiologic requirements, the test is comparable to the urea clearance and concentration tests. The hippuric acid excretion test is purely a test of function, and any diagnostic aid that it gives is incidental. As an aid to treatment and prognosis the test should find its widest application. A comparison of the Takata-Ara and hippuric acid tests shows that the Takata-Ara test in 8 of 29 patients with hepatic disease was strongly positive, in 7 it was moderately positive and in 14 it was weakly positive or absent. The discrepancy between the results of this test and that of the hepatic function was even more apparent in patients with disease of the gallbladder and ducts in which only one out of fourteen tests produced a significant reaction, even in the presence of a considerably diminished hepatic function. The Takata-Ara test was not specific for cirrhosis of the liver or parenchymatous hepatic disease. The reaction was frequently not obtained in early cases. The test was useful in differentiating parenchymatous and obstructive jaundice. In 15 of 20 cases of parenchymatous disease strong or moderate reactions were obtained, whereas in only 2 of 14 cases of obstructive jaundice were moderate reactions obtained. Therefore it appears that the Takata-Ara test alone is unreliable as a test of hepatic function or as diagnostic of hepatic disease.

- \*Some Pharmacologic Properties of Serum with Special Reference to Its Use as Blood Substitute G Reid and Marjorie Bick—p 245  
Traumatic Shock and Concussion J W Tomb—p 250  
Tuberculous Lesions Found at 1 500 Australian Autopsies J B Cleland—p 256

**Pharmacologic Properties of Serum**—Reid and Bick investigated the origin of the pharmacologic properties present in serum, the means of determining their presence and the method of preparing serum which would contain a minimal amount of them. The presence of a smooth muscle stimulating and vasoconstrictor substance (or substances) in serum prepared by the clotting of whole blood was regularly demonstrable. Plasma or whole blood did not possess these properties. The activity of serum depended on the number of platelets present in the plasma at the time of clotting. For instance, serum prepared from plasma centrifuged at high speed was devoid or almost devoid of activity, whereas that prepared from plasma prepared by the gravity method was nearly as active as that from whole blood. That the platelets are the source of the muscle stimulating substance was further confirmed by the preparation of platelet extracts whose activity was quantitatively equal to or greater than that of serum made from the original platelet-containing plasma. Evidently the active substance is preformed in the platelets and its liberation is incidental to the clotting process. Serum which had been boiled still retained its muscle stimulating and vasoconstrictor action. Serum could be freed of the substance by dialysis against distilled water through cellophane membranes. Thus the active substance is not protein in nature. Serum stored at room temperature or in a refrigerator at 0 to 2 C retained its muscle stimulating and vasoconstrictor action without appreciable reduction in activity for at least three months. The drying of serum by the method of Flosdorf and Mudd was without effect on the activity. The importance of the pharmacologic properties of serum must be determined clinically. So pronounced sometimes was the reaction in cats after even small doses of serum that if man behaved in an analogous fashion the intravenous use of human serum would certainly be contraindicated. However, there is no evidence that man does react in such a manner. It is difficult to assess the inferiority of serum to other blood substitutes in relation to the pharmacologically active substance that it may contain, because many reports do not state how the serum was prepared and that pyrogens were excluded. It is perhaps significant that the reactions following its use have been mainly febrile and do not differ from those that sometimes occur with plasma or whole fresh or stored blood. It is difficult to see how the muscle stimulating substance can be responsible for such reactions. There is no evidence that these pharmacologic properties are responsible for serum reactions, though it is theoretically possible that they may be important in producing circulatory reactions when a large dose is given to a susceptible subject.

\*Aspects of Paroxysmal Tachycardia Two Families in Which Tendency to "Heart Attacks" and to Certain Electrocardiographic Changes Are Frequent R F Ohnell—p 326

**Arterial Hypertension, Hypothalamic and Hypophyseal Systems**—Van Bogaert and van Baarle point out that in some cases of essential hypertension there exist diverse sympathetic signs which resemble those produced by experimental stimulation of the hypothalamus in dogs. The authors explored the possible role of hypophyseal hyperactivity or of normal hypophyseal secretion on the stimulation of the hypothalamic centers and tracts. As a result of a critical study of signs of hypophyseal hyperactivity in a case of essential hypertension, the authors have arrived at the following conclusions. Liberation of the encephalobulbar sympathetic pressure centers causes, on the one hand, arterial hypertension and, on the other, excessive secretion of the hypophyseal hormones. Numerous animal experiments enabled the authors to prove this hypothesis. The presence of hypophyseal hormones in larger than normal quantities in the body fluids does not permit the conclusion that a causal connection exists between this hypophyseal secretion and the increased blood pressure, since both are independent sequels of an excitation of the sympathetic encephalobulbar centers, among them those of the hypothalamus.

**Paroxysmal Tachycardia Familial Occurrence**—Ohnell reports observations on two families in which there existed a tendency to heart attacks. In the first family 6 siblings varying in ages between 2 and 16 have histories of heart attacks. These were characterized by changes in frequency and in rhythm, by sensory symptoms in the cardiac area and by short periods in which consciousness is almost lost. Electrocardiograms of the father and of 1 of the children presented knotting at the end of the QRS complex. The father had attacks of tachycardia and of bradycardia. These were frequently followed by polyuria. Of his 11 siblings 5 had had heart attacks for several years. His mother, grandmother, 2 cousins and 1 nephew likewise had attacks of heart symptoms. The second family comprised 12 siblings of the ages between 30 and 49, of whom 2 had died early. The oldest had the Wolff-Parkinson-White syndrome, 2 had attacks of paroxysmal tachycardia and 1 of these had auricular extrasystoles, 1 showed knotting in the first lead and a flat termination of the QRS complex in the chest lead, 1 had heart attacks of changing character—pains, frequency changes, polyuria and occasionally nearly fainting, the electrocardiogram showed in leads 2 and 3 knotting or flat decline in QRS, another 1 had since childhood attacks of paroxysmal tachycardia. A familial predisposition to cardiac symptoms is apparent. The question arises whether the concurrence is accidental or whether it is a hereditary polymorphic disease entity. The author considers the latter possibility as most probable and concludes that paroxysmal tachycardia apparently may be hereditary.

\*Three Cases of Stenosis of Splenic Vein L Cid Rojas and A Wiederhold—p 83

Nodal Proxystic Tachycardia G Duffau O—p 114

Amebic Rectitis Secondary Anemia V de la Maza S—p 133

Cured Pneumococcal Meningitis C Carrasco H—p 137

**Stenosis of Splenic Vein**—According to Cid Rojas and Wiederhold, stenosis of the splenic vein involves differentiation from the splenomegalies of infancy. It is a typical clinical entity which is characterized by splenomegaly, gastrointestinal hemorrhages and secondary anemia. These symptoms can be explained in the following manner. The obstruction in the splenic vein

causes a venous stasis in the spleen with considerable tumefaction of this organ, a collateral circulation develops in the anastomosis with the gastric veins and in the veins of the splenic capsule and those running to the diaphragm. These anastomoses dilate more and more and in turn they become thrombosed. The result is esophageal and gastric varices which rupture and give rise to hematemesis. The authors mention some of the terms applied to this disorder in the literature: splenoportal thrombosis, thrombosis of the splenic vein, portal splenic thrombosis and thrombophlebitis, thrombophlebitic splenic tumor, splenic phlebostenosis, splenic pylestenosis or splenic pylephlebostenosis. The authors regard the last term as the most suitable. They report 3 cases of stenosis of the splenic vein. Among general causes of the condition are cachexia (tuberculosis, cancer, brucellosis), general infections (syphilis, typhoid, influenza, puerperal fever and dysentery) and diseases of the blood (leukemia and polycythemia). As local causes are mentioned pathologic processes of the adjacent areas (appendicitis, ulcer, splenitis and cholecystitis), hepatic lesions, tumors of the stomach, pancreas and duodenum, retroperitoneal lymph nodes, traumatism of the abdomen, infection of the umbilical vein in children and gastrointestinal disturbances. The duration varies from a few days to years. The prognosis is unfavorable. The symptom on which the diagnosis is based is the combination of splenomegaly with hematemesis. The treatment in the presence of gastrointestinal hemorrhages consists of blood transfusions. Relapsing hemorrhages and painful splenic tumor have been treated by splenectomy, but this intervention is contra-indicated in cases of suspected involvement of the portal vein. In children splenectomy has been known to produce favorable results. It can be considered only as a palliative treatment.

\*Sulfonamide Derivatives for Intraperitoneal Injection in Children V Zerbino and A Norbis—p 37

**Sulfonamide Derivatives by Intraperitoneal Injection**—Zerbino and Norbis confirm the rapidity of absorption of the sulfonamide derivatives by the peritoneal serosa. In a child of 14 months with febrile respiratory catarrh, diarrhea, repeated vomiting, otitis and pyuria, dietetic treatment proved ineffective and dehydration and acidosis developed with loss of much weight. Sulfathiazole treatment by mouth was made impossible by the continuous vomiting. Two tablets of 0.5 Gm each were dissolved in 10 cc of isotonic solution of sodium chloride brought to the boiling point, left to cool and then injected into the abdominal cavity. The dose was repeated in the afternoon and for two more days without any sign of intolerance. The improvement was rapid, fever, vomiting and diarrhea disappeared and the appetite improved. In 2 infants of the ages 2 and 8 months with meningitis it was demonstrated that the sulfonamide derivative administered by the peritoneal route rapidly passed into the cerebrospinal fluid. The authors conclude that the intraperitoneal administration of sulfonamide derivatives in children will not remain an extraordinary measure but will become the most effective technique in many grave disorders. They stress the following advantages: 1 The technique is harmless and well tolerated. 2 It insures rapid absorption and will be particularly valuable in urgent cases. 3 It

apparently permits the best diffusion in the cerebrospinal fluid and is therefore indicated in meningitis. 4 It makes possible administration of large amounts at one time when intensive treatment is necessary.

\*An Isuppurating Effect of Red Rays J Erdely —p 723

**Antisuppurating Effect of Red Rays**—Erdely protected the area of smallpox vaccination in infants and children with a shield of two layers of red transparent material. The inner layer is loosely attached to the external one, which has some perforations for ventilation. Rays of natural light pass through the perforations and are filtered through the inner layer of red material allowing only red rays to pass. This shield prevents inflammation, fever and suppuration. Vaccination results in the formation of a serous vesicle. General reactions do not take place. When the shield is applied after suppuration has formed the local and general reactions are diminished but are not prevented. The author believes that the inflammatory reactions of vaccination and suppuration are due to hypersensitivity of the skin to ultraviolet rays whereas red rays have the effect of preventing suppuration. The immunizing effect of vaccination without suppuration is the same as that of vaccination with pustules.

Multiple Hautnekrosen bei Thrombangitis Obliterans W Kohlmeier  
—p 783

**Lymphogranulomatosis of Skin**—Tappeiner states that the isolation of lymphogranulomatosis from the group of disorders designated by the collective term pseudoleukemia was accomplished by the Viennese school of pathologists and dermatologists particularly Paltauf and Sternberg. The disease is still sometimes erroneously referred to as Hodgkin's disease. More than a hundred years ago Hodgkin described a clinical picture characterized by enlargement of the lymph nodes and sometimes also of the spleen. Later investigators were able to demonstrate that Hodgkin's description included disorders that differed greatly in etiology. Tappeiner describes 13 cases of lymphogranulomatosis with involvement of the skin which were observed at a Vienna dermatologic clinic in the course of the last decade. He differentiates four main forms: (1) the unspecific (2) the transitional (3) the specific and (4) the mixed form. He subdivides the unspecific form in (a) localized (b) generalized and (c) universal manifestations. The transitional form usually resembles the specific form mentioned under 3. The specific form is classified by the author into (a) the infiltrating (b) the nodular and (c) the ulcerous. In the mixed form various types concur. The author describes the clinical aspects and the course of atypical observations particularly of the ulcerous form (ulcus lymphogranulomatosis) and other hitherto unobserved cutaneous changes. He discusses the granulomatous and the blastomatous nature of lymphogranulomatosis and its differentiation from a rare form of mycosis fungoides that is accompanied by nodule formation in the internal organs. The frequent occurrence of lipoid phagocytes in the lymphogranulomatous tissue, in the lymph nodes as well as in the skin is worthy of attention. The author evaluates this observation as related to Letterer's in xanthomatous lymphogranulomatosis, Gottron's in Hand-Christian-Schüller's disease and Arzts in xanthomatosis. Attention is directed to the involvement of mucous membranes and of internal organs and to rare localizations in the myocardium, the bladder and the female genitalia.

**Chemotherapy of Erysipelas**—Volavsek reports observations made in the course of oral administration of azosulfamide in 600 cases of erysipelas. In order to estimate the efficacy of this sulfonamide compound the results obtained were compared with those observed in 600 cases of erysipelas treated before the sulfonamide era. The patients were given 2 tablets of 0.3 Gm each three times daily until the fever had subsided and after that 1 tablet three times daily until the cutaneous symptoms disappeared. The sulfonamide treatment reduced complications from 15.5 to 4 per cent and the mortality from 6.5 to 2 per cent. The reduction in complications concerned chiefly phlegmons and abscesses. The fever subsided in 3.2 days as compared to 5.6 days without the use of the sulfonamide. The therapeutic effect of the sulfonamide was also manifested in a 50 per cent reduction of recurrences and in shortening of the average length of hospitalization from 11.9 to 8.5 days. Chemotherapy of erysipelas reduces the severity of the infection and thus leads to a more rapid cure; it represents a great advance in the therapy of erysipelas.

Form and Significance of Interrupted Circulation in Etiology and Pathogenesis of Aseptic Epiphyseal Necrosis F J Lang —p 581

**Vertebral Sarcomas**—According to Kienbock sarcomas appear in the vertebral column and in other parts of the skeleton in varying anatomic forms. He describes vertebral sarcomas of the infiltrating, sclerosing type in 4 children outlining the clinical and roentgenologic aspects. The cases show great similarity in their clinical as well as in their roentgenologic aspects. A vertebral body may show a diffuse density and a superficial haziness. This gives the impression of an inflammatory disease of the bone such as osteomyelitis or tuberculosis, especially if a noncalcareous, paravertebral mass adheres to the vertebra. This may simulate an abscess, a gravitation abscess, but is in reality a proliferating softened tumor mass. The author reports the history of a man aged 47 who had an infiltrating, sclerosing sarcoma with osteoplastic infiltration of the adjoining tissues, protrusion into the vertebral canal and compression of the spinal cord.

**Ligation of Carotid Artery**—Niedner reviews histories of 4 patients who were subjected to ligation of the internal or the common carotid artery because of an intracranial aneurysm. The multiplicity of the manifestations of intracranial aneurysm makes it impossible to cure all by the same operation. Ligation of the internal carotid artery is the operation of choice for basal aneurysms of the carotid artery and for aneurysms of the small vessels inside the brain. In these cases the mortality of carotid ligation is slight. Ligation for other conditions gives a high mortality. Previous to ligation of the carotid and previous to operation in the course of which the need for ligation may arise it is advisable to obtain an arteriogram of the healthy side in order to ascertain the likelihood of a collateral circulation developing. None of the other tests for collateral circulation are as reliable as the arteriogram. Patients in whom a collateral circulation is not likely to form because of advanced arteriosclerosis of the cerebral vessels or because of an open circle of Willis should be excluded from treatment by ligation of the carotid artery. Ligation should not be performed in the presence of suppuration in the neck or when infection of the operative field can be expected. In the presence of an arteriovenous intracranial aneurysm ligation of the internal carotid artery is done at the earliest from four to six weeks

**Ligation of Carotid in Erosion Hemorrhage Due to Peritonsillar Abscess**—Stabenau reports 7 cases in which this operation was employed to control erosion hemorrhage the result of a peritonsillar abscess. Ligation of the carotid in these cases was more effective than any other treatment. Other indications for the ligation of the carotid artery are hemorrhage as the result of injury to the carotid, hemorrhages in the course of extirpation of malignant tumors which adhere to the artery, and in operations for aneurysm. At the otorhinolaryngologic clinic in Leipzig ligation of the carotid artery has given favorable results in erosion hemorrhages resulting from peritonsillar abscess. The surgical technic described largely prevents possible cerebral complications of ligation of the carotid, so that the skepticism with which this operation is regarded is not justified.

Hospitalstidende

\*Case of Acute Febrile Hemolytic Anemia of Lederer Type K Hoyer  
—p 3387

**Acute Febrile Hemolytic Anemia of Lederer Type** — Høyer reports a case in which pallor, jaundice and hemoglobinuria appeared after a catarrhal angina in a boy aged 3. Anemia developed with the appearance of microcytes and megalocytes accompanied by leukocytosis and continued fever of about 100.4 F. There were normoblasts and erythroblasts in the blood and the reticulocyte count was increased, suggesting lively reaction in the bone marrow. The blood platelet count was reduced. The osmotic resistance of the erythrocytes was normal. Blood transfusion resulted in immediate improvement, and in the course of a month the boy was well. The author finds the clinical picture similar to that described by Lederer. The etiology of the disorder is unknown. Blood transfusion is the sovereign remedy. The manner of its action is not understood. Liver and iron are without effect in the acute stage but can be excellent adjuvants in the convalescent period.

Two Cases of Rectal Stricture in Venereal Lymphopathy R Steinert  
—p 3412

Case of Infarct in Greater Omentum O Bang Dietrichson —p 343

**Recurrent Hemorrhages and Arthritis Urica**—Opshahl describes 3 cases with the picture of (1) recurring hemorrhages of unknown cause, (2) arthritis urica and (3) hypertension. The hemorrhages occurred suddenly from the respiratory tract or the gastrointestinal tract, in 1 case from both, and are characterized by their tendency to recur. The arthritis urica also shows certain common features. Gradually in the course of many years a chronic polyarthritis develops with considerable destructive changes in cartilage and bones and with the typical picture of arthritis urica. In 2 cases there have been acute aggravations with transient enlargement and tenderness of one or several joints, usually one at a time. There is considerable hypertension in 2 of the cases, without reduction of the renal function, the third case shows less hypertension and definitely reduced renal function. The author is inclined to believe that these patients have the constitutional anomaly which is the basis for arthritis urica and are exposed by the recurring hemorrhages to what he calls endogenous uric acid overloading with resulting manifest arthritis urica. In 2 cases, he says, the arthritis is perhaps due to this overloading with the endogenous uric acid, as the hemorrhages probably began before involvement of the joint, in the third it is more likely that the joint was already involved but that the condition was aggravated after the start of the hemorrhages.

**Hypertension as Result of Renal Ischemia in Dissecting Aneurysm of Aorta**—Three months before admission Bærgø's patient, a man aged 63, had normal blood pressure and urine. Moderate pain in the left lumbar region and intermittent fever set in, on admission there was considerable hypertension but the diuresis and the renal function were good. Intravenous urography showed deficient excretion by the left kidney while retrograde pyelography indicated normal conditions. The diagnosis was occlusion of the left renal artery and nephrectomy was considered, but increasing renal insufficiency developed and the patient died from uremia. A dissecting aneurysm of the abdominal aorta was found, with complete occlusion of the left renal artery, while the right renal artery was patent. The occlusion and the occlusion of the left renal artery are assumed to have developed progressively, with the occurrence of hypertension of Goldblatt's type. Eventually increasing thrombotic masses blocked the blood supply to the right kidney and uremia rapidly developed. The absence of sclerosis or narrowing of the arterioles is attributed to the short duration of the renal insufficiency.

## Book Notices

**Directory of Medical Specialists Certified by American Boards 1942**  
Published for the Advisory Board for Medical Specialties. Directing  
Editor Paul Titus MD Cloth Price \$7 Pp 2495 New York  
Columbia University Press 1942

The first edition of the directory was published in 1939. The second edition contains information in regard to eighteen thousand physicians who have applied for and have been granted certification by the various specialty boards. It is impossible to state how many qualified specialists in the country have not sought such certification and are therefore not included in the directory. The directory cannot be considered as providing a complete list of all qualified specialists in the various fields of medical specialties. However, the fact that the new edition contains four thousand additions since the publication of the first edition is an indication of the respect which the profession has for certification by the various specialty boards. The greater portion of the directory is devoted to a geographic listing of the specialists certified, a special section being devoted to each of the specialty boards. Rather complete biographic information is given with regard to the training and experience of each of the physicians listed. Included in each section is a list of the officers and members of the various specialty boards, together with history and organization reports, qualifications of candidates for certification and methods of conduct of examinations. Following the section devoted to the various specialty boards is an alphabetical list of all specialists certified, together with their addresses and the specialty board by which they have been certified. The directory provides much valuable information and will be especially useful in connection with the mobilization of the medical profession in the present military program.

**White Eagle Chief of the Poncas** By Charles Leroy Zimmerman MD  
Cloth Price \$2.50 Pp 273 with 170 illustrations Harrisburg Pa  
Telegraph Press 1941

White Eagle, for fifty years chief of the Ponca tribe of American Indians, was remarkable for his great mind and was noted for his courage, high ideals and principles combined with the attributes of an orator and statesman. The author years ago was agency physician for the Poncas. He has done worthy and interesting research in writing a history of the tribe. He has drawn freely from official sources traditions folklore and old men's tales recorded through interpreters. The migrations of the Poncas through much of the United States and possibly Mexico, Central and South America probably have extended over thousands of years, yet today the tribe has some customs similar to those of the days of the mound builders. The author adds to the dim past, their tribal ceremonies the history of their more recent wars, their belief in the supernatural which was the province of their medicine men and the factual history of their treaties with our government. The oldest son of White Eagle was the last hereditary tribal Indian chief in the United States. Under present government ruling no tribe may select a chief after the death of those in power at the time the government order was issued. The affairs of the Poncas therefore are now in the hands of a council consisting of White Eagle's grandson, McKinley Eagle, and six other persons.

**Handbook of Communicable Diseases** By Franklin H. Top AB  
MD M. H. Director Division of Communicable Diseases and Epidemiology  
Herman Kiefer Hospital and Detroit Department of Health  
Detroit and Collaborators Cloth Price \$7.50 Pp 682 with 83 illustrations  
Including 10 color plates St. Louis C. V. Mosby Company 1941

Textbooks dealing with communicable diseases often fail to give the reader a broad view of the public health aspects of these disorders. The tendency is rather to adhere to the presentation of clinical data and their discussion. This may be the reason why the medical student and many practicing physicians fail to acquire an adequate knowledge of the public health connotations of communicable disorders. This book has combined the clinical aspects of communicable disease with the epidemiologic. For example in the discussion of pneumococcus

pneumonia there is an excellent presentation of the clinical aspects of the disease together with much important epidemiologic information. It is pointed out that certain types of pneumococci are much more frequent in healthy family contacts than in the population at large. This has but recently been made known to public health workers and is of more significance to them than to the general practitioner. Sufficient material is presented in the text to broaden the point of view of the reader be he a general practitioner nurse public health worker or teacher. The various diseases in the text are classified according to the port of entry of the etiologic agent. No matter what classification is used some overlapping occurs but the departure from the usual method of presentation is interesting. The color plates are good and the illustrations adequate.

**Textbook of Medical Treatment** By Various Authors Edited by D. M. Dunlop BA MD FRCP Professor of Therapeutics and Clinical Medicine University of Edinburgh Edinburgh L. S. P. Davidson BA MD FRCP Professor of Medicine and Clinical Medicine University of Edinburgh and J. W. McVee DSO DSc MD Physician H. M. the King in Scotland. With a foreword by the late Professor A. J. Clark BA MD DPH. Second edition Cloth Price \$8 Pp 1179 with illustrations Baltimore William Wood & Company 1942

The first edition and a large amended reprint of this book were exhausted in approximately two years, a fact which speaks well for its value to medical practitioners and students. The book is designed to fill the gap left by the majority of textbooks on general medicine in their sections on treatment. This edition has been completely revised and certain errors of omission and commission corrected. The sections devoted to epidemic meningitis—cerebrospinal fever of the British—septicemia venereal diseases and respiratory diseases have been extensively revised and brought up to date—a requirement brought about largely through the rapid advances in sulfonamide therapy. An interesting difficulty encountered in this revision is concerned with dietetic treatments and the availability of certain foodstuffs in Britain during the war. Thus for example two paragraphs are devoted to wartime restrictions and modifications in the diabetic diet. Most of the treatments outlined are reasonably standard though experienced internists may in some instances differ as to the detail of certain of the recommendations. It is difficult to single out any special sections for criticism or commendation. However, the discussion on the adjustment of the sexual instinct is combined with so much common sense and unusual brevity as to impress the reviewer particularly. This is essentially a reference book for medical students and general practitioners on the standard procedures of medical treatment.

**Nursing Care of Communicable Diseases Prophylactic Technics for the Prevention and Control of Disease** By Mary Elizabeth Pillsbury RN MA With a chapter on Fungous Diseases By Grace Maguire Swanner MD And a Brief Picture of Public Health Nursing By Mary F. Edgecomb RN Science Adviser Jean Broadhurst PhD Professor of Bacteriology Teachers College Columbia University New York City Sixth edition Cloth Price \$3 Pp 604 with 138 illustrations Philadelphia Montreal & London J. B. Lippincott Company 1942

This book contains a store of information for one who either plans to follow a career in public health or is now engaged in that special field of nursing. For the average student in training the scope of the text is perhaps too broad to be readily absorbed. Nevertheless it would still serve well for reference, and medical students and practitioners also could profit from its use.

Although the author states in the preface to this edition that she has carefully reviewed the entire text and that 'particularly important is the addition of new material on chemotherapy no noteworthy improvements over the preceding edition are apparent.

Discussions relating to the treatment of some of the sixty different diseases included in part two, though necessarily brief could be better. In the chapter on diphtheria a nurse might easily gain the impression that sulphanilamide could be given as a substitute for antitoxin. And the statement in reference to laryngeal diphtheria that "immediate relief to the breathing is given by suction expresses a degree of optimism which could be based only on a lack of experience. The description of the nurse's duties relating to intubation are incomplete.

There is no mention of the sulfonamides in connection with erysipelas, and the chapter on meningitis evidently escaped revision. The latter should be brought up to date. The author says that the prognosis for influenzal, streptococcal and pneumococcal meningitis "is almost always hopeless, the fatality being about 100 per cent." It is also stated that meningococcal meningitis patients are given antiserum intraspinally every eight to twenty-four hours.

Reference to the Dicks' accomplishments is scanty, and the assertion that "the urticaria following the giving of the serum may not show up until one to two weeks" is misleading. There are few reactions from the scarlet fever antitoxin now on the market. Apparently a poor opinion is held with regard to vaccine for whooping cough prevention. No vaccine is specified by name. The horse serum mentioned for the treatment of poliomyelitis may refer to Rosenow's antipoliomyelitic serum, but if so there is nothing to indicate it.

There seems to be a trace of provincialism in the medical aspects of the book.

**Medical State and National Board Summary.** By William H. Kupper, M.D. With a foreword to the Candidate by Earl S. Hallinger, M.D., Secretary, New Jersey State Board of Medical Examiners. Cloth. Price \$4.50. Pp. 369 with 40 illustrations. Paterson, N. J.: Colt Press Publishers, 1942.

This is a compendium designed to provide a handy and inexpensive summary for state board applicants, physicians, interns and nurses. The condensation has been so thorough that the author believes he has made available in one volume most of the fundamental principles of the science of medicine which ordinarily occupy several volumes. This has been possible through the extensive use of line drawings of the organs, areas and parts of the body and by a compact style of writing. The first chapter is on anatomy, the second on physiology, followed by biochemistry, pathology, bacteriology, preventive medicine, pharmacology and therapeutics, obstetrics and gynecology, surgery and medicine. Most of the chapters are followed by numerous questions with the page indicated where the answer will be found. A chapter contains questions asked in a recent examination by the National Board of Medical Examiners followed by brief answers or references to pages in the book where the answers will be found. The book closes with a glossary of commonly used medical terms and three pages on the history of medicine with names of distinguished members of the profession and the achievements that led to their prominence.

**Dermatologic Therapy in General Practice.** By Marion B. Sulzberger, M.D. Lt. Comdr. (M.C.) U.S.N.R. Assistant Clinical Professor of Dermatology and Syphilology, Skin and Cancer Unit of the New York Post-Graduate Medical School and Hospital of Columbia University, New York, and Jack Wolf, M.D. Attending Dermatologist and Syphilologist, Skin and Cancer Unit of the New York Post-Graduate Medical School and Hospital of Columbia University. Second edition. Cloth. Price \$5. Pp. 632, with 67 illustrations. Chicago: Year Book Publishers, Inc., 1942.

Here, designed especially for the general practitioner is a manual on diseases of the skin. The success of the first edition prompted a development of the new edition, with special emphasis on the five day treatment of syphilis, the treatment of burns and the use of the sulfonamides in dermatology. The association of the senior author with the Navy caused some changes in the book especially to adapt it to the use of naval medical officers. The book is in every sense a practical handbook for the physician who does not specialize in dermatology. It should serve, however, also as an excellent work for teachers of dermatology, who are necessarily limited in the amount of time that may be given to instruction in this subject.

**The Golden Jubilee of the Association of Military Surgeons of the United States. A History of Its First Half Century—1891-1941.** By Edgar Erskine Hume, Colonel, Medical Corps, United States Army. Cloth. Price, \$2. Pp. 371, with illustrations. Washington, D. C.: The Association, 1941.

The idea of forming the Association of Military Surgeons of the United States originated with Dr. Nicholas Senn, professor of surgery at Rush Medical College, Chicago. Dr. Senn practiced military surgery in Cuba in the Spanish-American War, where he was chief surgeon of the Sixth Army Corps.

The first meeting of the association was held on Sept. 17, 1891 at the Leland Hotel, Chicago. Dr. Senn was elected its first president. The author of this history summarizes consecutively the work of and the program presented at each of the forty-eight annual meetings which have been held. He prints the names of honored guests at the meetings, the resolutions passed, the titles of papers presented, pictures of the past presidents, the convention badges, and some title pages of the *Military Surgeon*, the official organ of the association. Brief biographic sketches are presented of each editor of the *Military Surgeon*, also a tabulation year by year of the papers published.

**Schizophrenia. The Cinderella of Psychiatry.** By Reg. S. Ellery, M.D. F.R.A.C.P., Consulting Alienist to Women's Hospital Melbourne. Cloth. Price, 12s. 6d. Pp. 170. Sydney: Australasian Medical Publishing Company, Limited, 1941.

This monograph is called by the author "an adventure into that realm that sprawling mental province called schizophrenia." It is a cleverly written contribution and is simple to digest. The author has borrowed idioms and sayings from many literary geniuses to emphasize the point under discussion. He speaks of Nebuchadnezzar's Bitter Grass, Through the Looking Glass, the scourge of schizophrenia, in the beginning, flowers of Evil. In the eyes of the reviewer this is a unique way of expressing oneself regarding schizophrenia. For that reason the book should be a "must" purchase for every neuropsychiatrist. Psychotherapy, prognosis and prophylaxis are adequately discussed. Although there are no bibliography and no new facts, this contribution will serve as a brief summary of the data regarding schizophrenia and for that reason is recommended.

**Pediatric Gynecology.** By Goodrich C. Schauffer, A.B., M.D. Assistant Clinical Professor of Obstetrics and Gynecology, University of Oregon Medical School, Portland. Cloth. Price \$5. Pp. 384, with 66 illustrations. Chicago: Year Book Publishers, Inc., 1942.

This pioneer book deals with pediatric gynecology. The author has had extensive experience, so the book is based not only on the literature but also on large personal knowledge. The material encompasses not only disturbances of the external and internal female genitalia but also surgical considerations including urologic and proctologic conditions. There is an excellent chapter on menstruation and its disorders in young girls. At the end are chapters on social service and medicolegal aspects of pediatric gynecology. The book is beautifully written and amply and clearly illustrated. The publishers have done their part extremely well. This book definitely belongs in the hands of every gynecologist, pediatrician, urologist, proctologist and general practitioner who deals with young girls.

**Contribución al estudio de la terapéutica de la infección tuberculosa.** Por el Prof. Isidoro Ricardo Steinberg. Tesis de profesorado. Paper. Pp. 365 with 12 illustrations. Buenos Aires: Aniceto López, 1940.

This is a well organized and orthodox summary of the recognized methods of treatment of tuberculosis, offered as a professorship thesis to the University of Buenos Aires. The author has classified the subtitles under the three general heads: (1) treatment of the soil, (2) treatment of the bacilli, (3) treatment of the focus. Under each of the general headings there are chapters carefully divided into paragraphs, each contributing its quota necessary to complete the entire field indicated in the title. The presentation constitutes an excellent compendium relating to all the methods of treatment, non-surgical and surgical, recognized as appropriate according to present day standards.

**The Bond Between Us (The Third Component).** By Frederic Leitch, M.D. Diplomate of the American Board of Obstetrics and Gynecology. Cloth. Price, \$2.50. Pp. 267. New York: Alfred A. Knopf, 1941.

The author of Consultation Room again has drawn on his experiences as a clinician who specialized in obstetric and gynecology to produce a book with sufficient interest and humor to create further approbation of his writings. Regardless of whether this book will receive more popularity with the public than with the medical profession, it is one that should interest the student and young practitioner. Part of the appeal in the book results from the author's handling of Furstenberg's statement "It is our aim to demonstrate that there are more than cold facts in any medical curriculum."

## Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT, HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS, BUT THESE WILL BE OMITTED ON REQUEST.

### APPLICATION OF HEAT FOR SHOCK

**To the Editor**—Although I prescribe conservation of body heat in the treatment of shock, this treatment is not compatible with my understanding of the physiologic basis of shock therapy. I realize that a subnormal temperature is common in shock; however, the body temperature can safely fall much lower than we see even in shock. If our chief object in the treatment of shock is to maintain ample blood supply to the brain and internal viscera, why should we bring this blood to the periphery by applying blankets and external heat? It would seem to me more advantageous to allow the body surface to be cool so that the blood supply could be shifted to the internal organs, even though it would result in a slight lowering of the body temperature. I would be interested in your opinion on this subject.

I R Morrison MD Atchison Kan

**ANSWER**—The principle of conservation of body heat in the treatment of shock is established on the extensive practical studies made during the World War. Exposure to cold of soldiers in shock had a bad effect, and benefit was observed from the application of heat.

Superficially it may appear that cooling of the body of a person suffering from shock would be advantageous for the reasons stated in the inquiry, however, relatively little blood can be expressed from the skin by cooling because of the peripheral vasoconstriction present in shock. In fact, if cooling of the surface of the body is attended by a fall in body temperature of as little as 0.5 degree, shivering may be induced. This would greatly increase the expenditure of energy and increase the blood flow through skeletal muscle, which would be distinctly dangerous to the shocked person. Furthermore, as the temperature of the body is reduced, hemoglobin holds oxygen more firmly. This would aggravate the anoxia that is present in shock.

Excessive warming of the body is also to be avoided for the reasons outlined in the question. The practical application of the principle of conservation of body heat in the treatment of shock is, therefore, not as simple as it appears. It is probable that the patient in shock, unless his body temperature—not skin temperature—is below normal, does not require an environmental temperature above comfortable levels. The coldness of the skin, a common indicator for the use of heat, is due to peripheral vasoconstriction. The use of extreme heat is undoubtedly harmful, and experimental evidence fails to show harm from cold (Blalock, Alfred, and Mason M F. A Comparison of the Effects of Heat and Those of Cold in the Prevention and Treatment of Shock, *Arch Surg* 42:1054 [June] 1941). A sound practical rule to follow in governing the covering and warming of persons in shock is to keep them warm and dry.

### CALLUSES ON HANDS OF HAT WORKERS

**To the Editor**—Kindly advise me as to the best method of treatment of callus formation on the skin of the palms of the hands; this procedure is to be used for laborers whose hands are continually in steam while blocking hats. The body salt loss has been replaced by salt ingestion.

George S Stern MD New York

**ANSWER**—The extent of callus formation among workers occupied in blocking felt hats probably is partially based on an individual disposition. Persons with a tendency to ichthyosis, xerosis, and hyperhidrosis are said to be more inclined to have calluses than normal persons.

Treatment of calluses—which to a certain degree protect the worker's hands against steam, acids and friction—is usually not indicated unless they become painful, eczematized or fissured. If, however, such treatment becomes necessary, the hands should be soaked for one or two days (one hour, four times daily) in warm boric acid solution, soaking is to be followed by the application of a 10 to 20 per cent salicylic acid ointment for several days after which time the excessive horny tissue can be shaved off with a scalpel. Fissures should be painted twice daily with a 10 per cent silver nitrate solution.

In cases of resistant calluses, intensive roentgen irradiation can be tried, but this is usually followed by a recurrence if the worker resumes his regular occupation. The tendency to hyperkeratosis and fissuring can be reduced in some cases by the ingestion of large doses of vitamin A or by thyroid medication. In suitable instances rubber gloves may be worn as a protective measure.

### ALLERGY AND METRAZOL SHOCK

**To the Editor**—Several months ago a Negro aged 20 with dementia precox came under my care. He was given metrazol shock therapy with good results at first but later relapsed and has not responded well this time. He has a history of hay fever and moderate asthma occurring during the fall (ragweed season) and shows sensitivity to ragweed on cutaneous tests. He has had this allergy since early childhood. There is also a family history of allergy. The point of interest is that since metrazol therapy the sensitivity has persisted on cutaneous testing but he has had no hay fever or asthma during this ragweed season for the first time in many years. Did metrazol therapy have anything to do with his relief? Could you give me any references to the literature on this type of case?

M D Tennessee

**ANSWER**—Metrazol is one of the methods used for shock therapy in dementia precox. It is a powerful drug and causes severe reactions. These changes probably lead to a condition akin to that produced by other types of nonspecific shock therapy, e g, intravenous typhoid or gonococcus vaccine or fever therapy as induced by diathermy. These methods of treatment frequently bring temporary relief in various forms of allergic conditions, especially bronchial asthma, hay fever and allergic rhinitis. It is also well known that allergic conditions, especially asthma, not infrequently disappear in whole or in part during pregnancy or after a bout of fever, as from pneumonia or influenza. The cause of such relief is not known but it is known that the relief is not permanent. One would expect that the patient's hay fever and asthma would return during the next ragweed season.

Aigner (*Med Klin* 33:1306 [Sept 24] 1937) employed a mixture of metrazol and ephedrine, which he found effective in the treatment of bronchial asthma as well as cardiac and pulmonary disorders in which dyspnea occurred. Of course the good effect of this compound might well have been due to the ephedrine. It is also well known that insulin shock therapy (which is similar to metrazol shock) of asthma has been used with apparently good, although temporary, results. The following are references to insulin shock:

### THE ARTICHOKE

**To the Editor**—As a subscriber to The Journal I wonder why you have never mentioned the artichoke (*Cynara scolymus*) so much spoken of in European medical reviews and so much used and prescribed by physicians here and in Europe. Many writers support the theory that the extract of the artichoke has highly medicinal properties and while it has not progressed much in other American countries this theory has good standing in Colombia. In view of the facts given and because the artichoke has attracted the attention of the medical profession in several parts of the world it is strange that in the United States physicians have not taken the trouble to investigate this plant. I believe it would be worth while if your Association would look into the matter in order to encourage some trials or observations and publish the results obtained.

Carlos Arbelaez C Medellín Colombia

**ANSWER**—Extracts of artichoke are apparently available commercially in France, and their use has been advocated in the treatment of hepatic and renal diseases, postoperative oliguria, pruritus, urticaria and asthma. Two plants called artichokes are commonly used as food. One is the Jerusalem artichoke (*Helianthus tuberosus* L.) and the other the French artichoke (*Cynara scolymus*). The tubers of the Jerusalem artichoke are similar to the potato and constitute the edible portion of the plant. The flower bracts of the French artichoke are considered a delicacy. The French artichoke is the species usually found on the market. Both types contain the carbohydrate inulin which is hydrolyzed to levulose instead of to dextrose, and because of this artichokes have been advocated as a food for persons with diabetes. However, there is no evidence that the diabetic tolerate levulose any better than they do dextrose, so apparently artichokes offer no advantage over the ordinary carbohydrate foods. This view has been stated in THE JOURNAL, Feb 4, 1933, p 342.

Several reports have originated in France regarding the use of extracts of the leaves and roots of the French artichoke as a cholagogue and diuretic. A crystallized material called cynarine has been isolated from these extracts. Apparently the edible portion of the French artichoke does not contain cynarine.

Artichoke extracts also have been advocated as an antitoxic substance. The evidence for their antitoxic action is not too conclusive. For instance, Gaudin (*Bull d sc pharmacol* 46:167 1939) fed sodium cacodylate to a series of guinea pigs. To some of the animals he fed also an extract of artichoke representing 35 Gm of artichoke per kilogram of body weight daily.

He claimed that autopsy revealed that there was less damage to the livers of the guinea pigs receiving the artichoke extract. However, he admitted that life was not prolonged by the administration of the extract.

### PROBABLE CEREBROSPINAL SYPHILIS IN INFANT

**To the Editor**—A boy aged 16 months, a second child, delivered with low forceps after a labor of seven hours, weighed at birth 8 pounds and 14 ounces (4 Kg). He smiled at 1 month, held up his head at 3 months and cut his first tooth at 6 months. At 5 months he began having daily clonic twitchings of the extremities. During these attacks, which recur four or five times every twenty-four hours, the extremities are drawn up and twitch, the eyes roll back, and the back is arched. Since the fifth month the child's progress has been retarded. At the age of 1 year he was hospitalized for study. The blood count and the urine were normal, the blood sugar content during fasting was normal (85 mg). Roentgenograms of the skull and the chest were negative, the Wassermann reaction of the blood of both mother and child was negative. The child's stool did not contain ova or parasites, the spinal fluid cell count was 3, the globulin reaction was negative, the colloidal gold curve was 0000000, and the Wassermann reaction of the spinal fluid was 4 plus. The blood calcium and phosphorus content was normal. The child has always had a poor appetite and has been hard to feed. The diet has been nutritious, with an adequate vitamin content. At present he is definitely retarded mentally. The general muscle tone is poor. The pupils are equal and react to light. The anterior fontanel measures 1 inch by 1 inch (2.5 by 2.5 cm), the posterior fontanel is closed. The height is 33½ inches (84 cm), and the weight 20 pounds and 1½ ounces (9.1 Kg). The child is expressionless, drools saliva, will not notice objects, cannot hold up the head or sit up and moves the right leg more than the left. Reflexes are present on both sides but are more active on the left. In all respects the child appears mentally defective. Should he have antisyphilitic treatment because of the 4 plus Wassermann reaction of the spinal fluid? Is it possible to have a positive Wassermann reaction of the spinal fluid with a negative reaction of the blood in mother and child?

William M. Petty, M.D., Pittsburgh

**ANSWER**—The boy described probably has cerebrospinal syphilis. There is no doubt that he has organic lesions in the brain. A birth injury, encephalitis, brain tumor and the like could cause such a picture but the 4 plus Wassermann reaction of the spinal fluid definitely points toward neurosyphilis. The Wassermann test of the spinal fluid should be repeated to confirm the first one before treatment is started.

It is possible to have a positive reaction of the spinal fluid with a negative Wassermann reaction of the blood. The child should have antisyphilitic treatment because of the 4 plus Wassermann reaction of the spinal fluid. Considerable improvement may result, but it is doubtful that complete recovery is possible.

### PERIADENITIS MUCOSA NECROTICA RECURRENS

**To the Editor**—A woman aged 43 has recurrent and rapidly receding "pimples" in her mouth which develop over three or four hours, are painless, rupture, exude a thick stringy substance and disappear, leaving no residue to be observed. This phenomenon has occurred about three times a week. She was treated for a typical outbreak of lichen planus including oral lesions about a year ago with twenty intramuscular injections of 2 grains (0.13 Gm) of bismuth subsalicylate, with complete disappearance of all lesions. She has demonstrated the "pimples" to her family, but before she is able to come to the office they have disappeared. All laboratory data are normal. Examination reveals linear white elevations along the inner sides of both cheeks and a recent similar noninflammatory lesion on the under surface of the tongue. I have considered retention cysts, lichen planus and dermatitis herpetiformis but am unable to fit the picture with any condition. Elimination diets were of no avail. Any assistance as to diagnosis and treatment will be appreciated.

M. E. Friedman, M.D., New Buffalo, Mich.

**ANSWER**—The occurrence of small painless nodules or "pimples" on the buccal mucosa that "exude a thick stringy substance" or result in the separation of a solid mummified-looking plug suggests the diagnosis of periadenitis mucosa necrotica recurrens. The course of this condition is chronic, and it is usually resistant to ordinary methods of treatment. The ingestion of drugs, e.g. phenolphthalein, should be ruled out, and any mouth washes or tooth paste used by the patient should be of a bland type. Attacks sometimes occur after the ingestion of oatmeal, but as a rule the condition is seen in patients with nervous instability, endocrine imbalance and low constitutional tone. It is therefore advisable to examine the patient completely for possible foci of infection depleting her reserve and for anemia. Specific therapy to relieve any constitutional conditions revealed by a complete general examination, together with the use of soothing mouth washes and the local application each night of a paint consisting of 5 cc of tincture of kino and 10 cc of tincture of myrrh may be of value. Sometimes the oral lesions occur with lesions on the vulva (Wien, M. S., and Perlstein, M. O. *Ulcus Vulvae Acutum* Associated with Lesions of the Mouth, *THE JOURNAL*, Feb. 6, 1932 p. 461).

### EFFECT OF ELECTRIC SHOCK THERAPY ON NORMAL SPAN OF LIFE

**To the Editor**—Is there any evidence that electric shock therapy shortens life?

Rolph H. Kuhns, M.D., Los Angeles

**ANSWER**—Electrically induced convulsions, since their introduction by Cerletti and Bini in 1938, have been employed chiefly in the treatment of patients with depressive mental state. Among their advantages claimed over the convulsive treatment with metrazol and insulin are that the danger of pulmonary and myocardial damage is seemingly less and that less of a fear reaction is produced in the patient. The danger of fracture, dislocation and injury to muscle appears also to be less in electric shock therapy than in therapy with metrazol. With metrazol therapy the chief cause of death is that exacerbation of chronic pulmonary tuberculosis is apt to occur. So far for more than ten thousand treatments by electric shock no deaths have been reported. However, because of the comparatively short experience with the new agent, no equivocal statement can be made at present as to whether the physiologic span of life of patients treated by electric shock may be shortened or not. The consensus is that electric shock treatment is contraindicated in the presence of serious chronic organic changes of the central nervous system, serious arteriosclerosis, cardiac disease, nephritis, active or recently healed pulmonary tuberculosis or other disease of the lung and any acute infection or febrile illness.

### HENOCH'S PURPURA

**To the Editor**—A woman aged 41 apparently has Henoch's purpura, and I should like some information as to treatment. The patient has recurrent ecchymoses of the skin, but her major symptoms are severe gastric intestinal pains, similar to gastric crises. Recently a laparotomy revealed no significant pathologic condition except some adhesions on the right side, which were released. Studies of the gallbladder and kidneys gave negative results, and the spleen was not enlarged. The patient has had appendectomy and hysterectomy. I hope you can advise me as to further treatment.

William D. Wessly, M.D., Glendale, Calif.

**ANSWER**—The treatment of Henoch's purpura (nonthrombocytopenic purpura) varies for different patients, depending on the cause. Sensitizing substances in the form of drugs, food or environmental products must be studied and must be removed if they are shown to be a cause of allergic reaction. If the granules of the neutrophils in the stained blood film do not stain blue but show the normal violet, it is not likely that a pyogenic infection is present. Calcium lactate 1 Gm three times a day may be given for its apparent effect in decreasing sensitivity to allergens. Epinephrine solution 1:1,000 may give symptomatic relief when injected subcutaneously or intramuscularly in doses of 0.5 to 1 cc. When there is evidence of a vitamin C deficiency, 100 to 200 mg of ascorbic acid in solution may be given intravenously for several days. Occasionally the desired effect is not obtained when the medicine is given orally. The sensitivity of the patient to moccasin snake venom solution (1:3,000) should be determined, and the medicine can be given in increasing doses intramuscularly, the injections starting with 0.3 to 0.5 cc twice a week and increasing until 1 cc is given over a period of weeks or months. A maintenance dose of 1 cc every week or two or three weeks may be determined. It may be well to note the effect in individual patients of histamine given by mouth.

### GLOMUS

**To the Editor**—What is the glomic or glomus system? Is there any relationship between the glomus system and a glomus tumor?

M.D., Brooklyn

**ANSWER**—According to definition (Webster's New International Dictionary, ed. 2, 1939, unabridged), the anatomic glomus is any coil or small plexus of blood vessels specifically one in relation to the pronephros. The term glomus has been applied anatomically to the carotid gland (glomus caroticum) and to the coccygeal gland (glomus coccygeum), which belongs generally to the chromaffin system, and to the glomus choroid, an extension of the choroid plexus into the lateral ventricle of the brain. The last mentioned anatomic use is in close agreement with the root significance of the term. Peripheral, i.e. cutaneous, arteriovenous anastomoses constitute other anatomic structures to which the term glomus has been applied and which in the aggregate are designated as the glomic system. Popoff's study (*Arch Path* 18 225 1931).

1934) of this system should be consulted. He has described the anatomic structure of the glomus as composed of (1) the afferent artery, (2) the Sucquet-Hoyer canal (the arteriovenous anastomosis proper), (3) the neuroreticular and vascular structures around the Sucquet-Hoyer canal, (4) the outer lamellar collagenous tissue and (5) the primary collecting veins. Masson (cited by Popoff) in 1924 described small subungual benign tumors, clinically painful, which he considered to be genetically related to the peripheral arteriovenous anastomoses. These he designated "glomus tumors."

### GONORRHEAL PROSTATITIS AND ARTHRITIS

**To the Editor**—A man aged 31 has had joint pains with swelling, heat, tenderness and redness for six weeks following prostatitis. The joint involvement was multiple at first but for the past three weeks has been confined to the left ankle thus suggesting a gonorrheal origin. Prostatic smears have thrice shown gram-negative extracellular diplococci. The patient's temperature was consistently elevated from 99 to 101 F for several weeks. Muscular pains were noted. Good relief was obtained from the use of salicylates in moderate doses and the sedimentation rate with the 1 cc Cutler tube has been consistently 28 to 32 mm in one hour thus suggesting rheumatic fever. As an aid to differential diagnosis can the elevation of the sedimentation rate be due to gonorrheal prostatitis and arthritis? Will salicylate therapy give relief in gonorrheal arthritis? Will a complement fixation test be of any real diagnostic value? In determination of the sedimentation rate with the 1 cc Cutler tubes should 0.1 or 0.2 cc of sodium citrate be used, and what should be the strength of the solution? M.D. Minnesota

**ANSWER**—The sedimentation rate can be elevated in gonorrheal arthritis and prostatitis.

Salicylate therapy often gives relief in gonorrheal arthritis.

A complement fixation test for the patient will tell no more than is already known as gram-negative diplococci have been found. However, such a test of the blood of this man, who presumably has specific infection of the prostate and seminal vesicles associated with metastatic and joint involvement, most certainly would have given a strongly positive complement fixation.

For determining the sedimentation rate most laboratory manuals suggest the use of oxalated blood. This may be used in any of the various tubes. One drop of a saturated solution of potassium oxalate is enough to prevent the coagulation of 8 to 10 cc of blood.

### EXCISION OF A SEBACEOUS CYST OF THE CHEEK

**To the Editor**—I am interested in the cosmetic aspects resulting from the excision of a wen in the right cheek about 1 to 2 inches from the angle of the mouth when approached from the inside rather than the outside. I have mentioned this to a number of surgeons but none have ever had the experience of approaching one from the inside. Could you refer me to any literature? J. B. Thompson M.D. Needham Mass.

**ANSWER**—A sebaceous cyst could be excised from the inside of the mouth if it was on the cheek, but it would be preferable to excise it from the outside although the scar might be greater. A sebaceous cyst is usually associated with an occluded sebaceous duct and it is usually considered wise to excise this occluded sebaceous duct with the cyst taking a small ellipse of skin. It would seem that there would be less likelihood of recurrence if it was operated on from the outside than from the inside. Moreover, the danger of infection in the operative wound is less from the outside than from the inside.

### EFFECT OF ANTEPARTUM NUTRITION ON CHILD HOOD GROWTH

**To the Editor**—What role does antepartum nutrition play in childhood growth? Has antepartum nutrition any bearing on the high number of rejections in the army?

Howard O. Brush M.D. Port Huron Mich.

**ANSWER**—While relatively little has been written on the subject, antepartum nutrition undoubtedly influences the future growth of children. It certainly has a bearing on their health at least during the first year or two of life. Dr. J. H. Ebbs (The Influence of the Antepartum Diet on the Infant *Am J Dis Child* 62:416 [Aug.] 1941) reported on the infant mortality of a group of adequately fed Toronto mothers as compared with a poorly nourished group. The difference in infant mortality was so much in favor of the well-fed group that the life of a baby could be figured in dollars and cents worth of groceries. According to his figures an infant's life was worth about \$215. It is also well known that since the deciduous teeth are formed before birth, much of their quality is dependent on the nutrition of the mother.

Whether this has anything to do with the high number of army rejections is problematic, since account of many new factors must be taken.

### CARCINOMA OF THE LIVER

**To the Editor**—I recently had a case of primary intracanalicular carcinoma of the liver. Would you kindly let me know the incidence of this new growth and refer me to any reports in the literature?

M.D. Virginia

**ANSWER**—Descriptive terms used to indicate the histogenic or histologic varieties of primary carcinoma of the liver do not include the (intra) canalicular form. This does not imply that the cells in a carcinoma of the liver with a hepatocellular structure may not produce bile canaliculi, the ultimate divisions of bile passages which in liver tissues lie between contiguous parenchymal cells. In the large bibliography cited by G. Herxheimer (in Henke F. and Lubarsch O. *Handbuch der speziellen pathologischen Anatomie und Histologie*, Berlin Julius Springer, 1930, part 1, vol. 5) no title includes the (intra) canalicular form. The generally accepted terms of primary carcinoma of the liver, expressed in terms of histogenesis or cellular differentiation are "liver cell" and "bile cell" each as the names imply with a cell structure repeating liver cell pattern or bile ducts (Loesch Johann. Primary Carcinoma of the Liver *Arch Path* 28:223 [Aug.] 1939).

### ASYMPTOMATIC CONGENITAL SYPHILIS

**To the Editor**—A girl aged 13 years asymptomatic congenitally syphilitic has been treated since the age of 8. The first course covered two years and consisted of alternating series of ten neosphenamine and six bismuth injections with no rest periods. At the end of this time the serologic reactions were persistently 4 plus. A subsequent series of fifty injections alternating neosphenamine and bismuth compounds was given after one year with no change in the serologic reaction. During the current year another series of treatments consisting of two courses of ten injections of mapharsen with an interposed course of six iodobismuth injections has been given. The Wassermann reaction remains steadfastly 4 plus to date. Is further heavy metal therapy indicated? What is the probability of the condition becoming active in the event of future marriage or pregnancy? M.D. Indiana

**ANSWER**—It probably would be advisable to give the girl further bismuth therapy and two series of ten injections each a year for the next three years might well be planned. If further treatment is necessary at the completion of this course arrangements might be made for it then. There is a possibility that in a girl of this age the disease might become active later on in life or possibly following pregnancy. Interstitial keratitis will occasionally develop in a young woman following birth of a child although she has been asymptomatic for many years previously.

### OIL FOLLICULITIS

**To the Editor**—There is a condition in a local plant for which you might give me some help. The plant is making steel shells with a copper band around the base. The shells are machined in oil. Lately the men have been having what they call oil pimples or oil boils. They work in oil up to their elbows and wash it off with a solvent when they stop work. Most of the pimples are more or less superficial but among 20 to 25 men working in a small area there have been a number of deep infections. I should like to know what can be done to eliminate these oil pimples or boils? Can one man with a virulent infection of the skin contaminate the solution so that others using it become infected? Edgar N. Mendenhall M.D. Fort Wayne Ind.

**ANSWER**—The condition described "oil pimples" is an oil folliculitis and is a common occupational dermatosis among workers with oil, such as machinists and machine tool operators. Numerous oils and emulsions are used in this process and it is improbable that any one oil is at fault. Oil folliculitis or as it is sometimes called cutting oil dermatitis has been discussed rather well in a recent bulletin No. 244 November 1941 of the Massachusetts Division of Occupational Hygiene, 23 Joy Street Boston in which the treatment and prevention are carefully outlined. It would seem probable that the oil could be contaminated and if recirculated without sterilization could cause infection in persons working in it.

### PREVENTION OF FORMATION OF CALCIUM OXALATE STONES

**To the Editor**—Can you give me information regarding methods for preventing the formation of calcium oxalate renal calculi?

Rolph H. Kuhns M.D. Los Angeles

**ANSWER**—Less is known about the formation of calcium oxalate renal calculi and the prevention of their recurrence than is known about any other type of renal lithiasis. Defects in metabolism apparently are the cause of stones composed of uric acid and cystine. Oversaturation with a low threshold to calcium phosphate is often present in the formation of calcium phosphate stones. All these forms of renal calculi are definitely

affected by dietary intake. Alkalization and acidification of urine also are factors in preventing the formation of cystine and calcium phosphate stones. Reduction in the intake of calcium is a large factor with calcium phosphate stones. It has not been demonstrated, however, that there is a low threshold of calcium oxalate in patients who form these stones. Their formation cannot be prevented by acidification or alkalization of the urine.

Dietary precautions are more indefinite with oxalate stones than with any other type. Since only approximately 15 mg of oxalic acid is excreted in twenty-four hours by the person with an ordinary diet, it would seem advisable to maintain a high urinary output. The elimination from the diet of vegetables containing a high content of oxalic acid, such as rhubarb, spinach and tomatoes, would also be indicated. This regimen would tend to prevent the formation of calcium oxalate in a concentration sufficient to allow its precipitation in the urinary tract. Fortunately, the incidence of recurrence with calcium oxalate stones is somewhat less than that with stones of other chemical constituents.

### CLOSTRIDIUM WELCHII CARRIERS

*To the Editor*—Recently a death was caused by a surgical wound infection. A culture was made of one of the assistants' stools, it was found positive for *Clostridium welchii*. The doctor has had an increase of gas in the bowels for many years but never suspected that it was anything but a harmless parasitic infection, such as *Giardia lamblia*. Please give the treatment for a carrier of *Clostridium welchii* who is a physician. Please give any medical references on treatment. What would be the best antiseptic for the hands besides a free use of soap and rubber gloves to protect others from accidental contamination? M D, New York

*ANSWER*—*Clostridium welchii* is a normal inhabitant of the intestinal tract of adults (Zinsser, Hans, and Bayne-Jones, Stanhope. Textbook of Bacteriology, ed 8, New York, D Appleton-Century Company, 1939, p 624). It is no more feasible to try to free the intestine of *Cl. welchii* than it is to free it of *Bacterium coli*. *Cl. welchii* is ubiquitous in nature and requires suitable conditions for growth such as necrotic tissue. Strains vary as to the toxins they produce. Good surgical asepsis and the wearing of sterile rubber gloves during surgical operations are important in reducing operative infections.

### PREGNANCY AND BLOOD GIVING

*To the Editor*—Should a pregnant woman in good health give blood for the Red Cross? In case there is no objection during the beginning of pregnancy, please state the time after which it would be no longer advisable. Walter Shifton, M D, Alban, N Y

*ANSWER*—There is a tendency of many pregnant women to have at least relative anemia during pregnancy. Frequently iron preparations are given to counteract this tendency. The removal of blood would deprive the woman of essential minerals and food materials which she has secured by elaborate metabolic processes. Her first duty is to herself and to her unborn child. It is advised that she do everything possible to maintain her health and not do anything which might impair it. An emergency, such as an abortion, a placenta previa or a postpartum hemorrhage, might arise. Under such a circumstance she might need the blood to protect herself. Hence blood donation would be ill advised. There are many persons other than the woman who could spare the blood with less possibility of harm to themselves.

### STRING TEST IN DIAGNOSIS OF GASTRO-DUODENAL ULCER

*To the Editor*—What is the consensus among gastroenterologists as to the value of the string test in the diagnosis of gastric and duodenal ulcer? W G Richards, M D, Billings, Mont

*ANSWER*—In 1909 Einhorn described the string test as an aid in the diagnosis of peptic ulcer. Briefly stated, it consists in the recognition of a blood stain on a string which has been introduced into the stomach and the duodenum. The appearance of the stain presumably indicates the presence and the level of an ulcerative lesion. Described before the era of modern roentgenologic technic, the test is of only slight corroborative value and has not been adopted or recommended by gastroenterologists. The objective diagnosis of peptic ulcer and the differentiation of benign and malignant ulcerative lesions of the stomach are much more valid when based on the evidence provided by roentgen examination and gastroscopy.

### PREGNANCY AFTER REMOVAL OF MALIGNANT TUMOR

*To the Editor*—In June 1941 I removed a mass from the axilla of a white woman aged 32. The pathologic report on this tissue was malignant lymphoma. Since that time I have seen the patient frequently and as yet have seen no evidence of recurrence. She came to me recently, and I found her to be two months pregnant. I checked her thoroughly at this time and found that she had gained 6 pounds (2.7 Kg) since the last examination. The red cell count was 4,800,000 and the hemoglobin content 85 per cent (Sohli). There was no evidence of disease in a 6 foot roentgenogram of the chest. The blood pressure was 110 systolic and 80 diastolic, and urinalysis showed no abnormalities. I should like your opinion as to how this patient should be handled. Should pregnancy be interrupted, or should she be allowed to go to term?

M D, Mississippi

*ANSWER*—There is little evidence that pregnancy would cause the recurrence of a tumor of the type stated or stimulate its growth should it recur. As the site of the growth is remote from the uterus and its contained fetus, there would be no contraindication to the use of radiation therapy. There is, of course, the possibility of a recurrence, with the resultant disability and shortening of life expectancy. This would deprive the baby of its mother, but there seem to be no medical indications for termination of the pregnancy. It is suggested that the patient be allowed to continue with the pregnancy but that future pregnancy be avoided.

### LENTICULAR ASTIGMATISM

*To the Editor*—Many eyes on refraction show astigmatism unaccounted for by the corneal astigmatism present. It is assumed that this is lenticular astigmatism. I have recently read that the optical system of a living eye with a contact lens in place, an refraction, shows no astigmatism. Is this true? If true, does it not disprove any effective lenticular astigmatism? J J Horton, M D, Budo, Texas

*ANSWER*—Probably the soundest as well as the simplest discussion on astigmatism is to be found in Tscherning's *Physiological Optics*, reprinted by Keystone in 1920, chapter IX, page 138. The literature to which reference is made that no astigmatism is to be found when a contact glass is in position is unknown to us, quite the contrary, in a rather extensive experience in fitting contact glasses several cases have been found that required either a spectacle lens before the eye or a cylindrical lens ground into the contact glass to correct lenticular astigmatism. Far better proof of the existence of true lenticular astigmatism is furnished by the Helmholtz measurements with the ophthalmophakometer.

### SHIN SPLINTS

*To the Editor*—I note in *The Journal*, April 11, 1942, an inquiry by Paul T. Perugini of New Rochelle, N Y, concerning "shin splints" and your reply, quoted from Thorndike *Athletic Injuries*. I do not consider Dr. Perugini's listed symptoms as typical of "shin splints", nor is his age group or the type of athletic endeavor engaged in likely to produce them. There have been a considerable number of similar cases at the Kansas City Athletic Club which I consider to be due to improper ankle support. Average persons between the ages of 35 and 55 who engage in games like paddle tennis, handball, badminton and squash are adopted to the ordinary heel of a street shoe and when they resume competitive sports they are not elastic enough to adjust themselves to the flat heelless tennis or basketball shoe without some evidence of strain. Treatment of this disability consists in a good toe lace, high top basketball shoe. Half inch sponge rubber lifts should be worn underneath the heels until the patient can find he can play without the symptoms. Ankle wraps should be worn by any adult playing a vigorous competitive game and having any type of leg symptoms. The majority of professional athletes in their prime wear ankle wraps, yet the occasional athlete will not take the trouble to use them. The best ankle wrap is a 2 inch wide linen bandage, 5 yards in length, wrapped in a figure of eight manner about the ankle. I do not consider these leg aches a counterindication for exercises.

Garrett Pipkin, M D, Kansas City, Mo

### FAMILIAL AND HEREDITARY CATARACT

*To the Editor*—In *The Journal* of April 18, 1942, section of *Queries and Minor Notes*, there is a letter from "M D, Missouri" regarding the advisability of having children in a family known to have congenital cataracts. The case in point is that of a young man who has cataracts himself but whose mother, maternal uncle, sister and brother have congenital cataracts. The answer states that "it would certainly be the part of wisdom for this young man to refrain from having children." While congenital cataracts may be transmitted by several types of inheritance the majority are transmitted as typical dominant characters and the genealogy of this family would not support this group. Accordingly, unaffected individuals of this family would not transmit cataracts to their offspring. This might be checked in the family by ascertaining whether or not the unaffected maternal aunts and uncles showed congenital cataracts in their offspring. I presume they did not. In my opinion, it would be entirely safe for the young man in question to have children as he is.

## LIFELONG CARE OF THE EYES

CHAIRMAN'S ADDRESS

LAWRENCE T. POST, M.D.

ST. LOUIS

Education and legislation are handmaidens of progress. Each has a place in bringing about and maintaining ocular efficiency. Of the two education is far the more important. "Train up a child in the way he should go, and when he is old he will not depart from it." Teach the proper care of the eyes to the child, and the man will continue it throughout his life.

It is my purpose here to suggest some of the ideas that a physician may give his patients so that they will acquire and preserve good eyesight throughout their lives. Of man's many blessings, good vision is by no means the least. His happiness, his earning and sometimes his very life may depend on it. In most of the animal kingdom, blindness means death. In man it usually means dependence at least.

### PRENATAL PRECAUTIONS

Wise prospective parents will evaluate, even before the conception of the child, what the health outlook for the child will be, and this is an essential consideration if the defects due to heredity are to be avoided. Some of these can be prevented by antepartum care. For example, a person afflicted with syphilis can be treated so as to be a safe progenitor. This is true of the tuberculous person also, but unfortunately the same is not the case with the man having Leber's hereditary optic atrophy or with one who has congenital cataract or retinitis pigmentosa. For these, in the light of our present knowledge, safety for the next generation lies only in nonpropagation. Here we must depend on legislation as well as education, for education will not restrain an ever existing irreconcilable element that won't listen to reason but will heed only the strong arm of the law.

Of equal difficulty in handling is high myopia, chiefly because of its frequency. The elimination of excessive myopia depends on restricting propagation by those having this condition, for there is little evidence to show that this is usually anything but a hereditary defect handed down just as other physical characteristics are. Continued stressing of the importance of judicious mating may result in its diminution and finally in bringing about its end. Certainly there is not much hope for therapy in myopia, though there is some evidence to show that certain measures are valuable in preventing

its increase in the individual but such limitation will obviously not influence the hereditary element. Even if it is impossible to bring about complete eugenic mating it may at least be feasible to prevent the marriage of two people afflicted with extreme nearsightedness. Failure to do this is probably the principal reason for the very large incidence of this defect among the Germans today.

In addition to the full correction of the myopia I urge a sane, healthful life for the child, a well rounded diet with a quart of milk or its equivalent in calcium each day, maintenance of a good posture especially not stooping when reading, in which position the eye hangs by the optic nerve almost unsupported, as a grape from its stem, a good light, work at not too close a distance from the eyes, and if the general examination indicates it, adequate dosage of thyroid.

### INFANCY AND CHILDHOOD

Passing from prenatal considerations to those of infancy, one encounters immediately one of ophthalmology's greatest triumphs. Thanks to the genius of two men, Neisser and Crede and to the tireless efforts of thousands of other physicians and laymen, the scourge of ophthalmia neonatorum has been put largely under control in civilized countries. As education spreads, we may reasonably hope to see this devastating disease obliterated. The disappearance of gonococci with the use of the sulfonamide derivatives is one of the miracles of modern medicine.

As pneumonia was so aptly termed by Osler "captain of the men of death" so might we name trachoma, in many places, "captain of the men of blindness." In those countries where as in Egypt scarcely any one escapes, trachoma is to be found in almost every native child in the first year of its life. Recent work points definitely to the responsibility of a virus, and the sulfonamide drugs whether they act directly on the organism, as some think or on the secondary invaders as others contend, certainly have a very valuable place in the control of this condition and will prove important in its elimination, though it is to be hoped that some more specific drug will be found. If the infant could be protected from infection, it would not be long before trachoma would cease to hold its prominent place among diseases of the eye because infection in the adult population can be controlled by education alone. Legislation might be enacted to require prophylactic treatment as much and as long as is necessary for all children living in infected families in somewhat the same way that legislation has demanded preventive treatment of ophthalmia neonatorum. However, since trachoma is a disease of illiteracy and insanitation, its elimination will ultimately follow the introduction of education and without this background of understanding and cooperation the enforcement of health rules is almost impossible.

Proceeding to a consideration of the phase of childhood, a question frequently asked by intelligent parents is "When shall I take my child for his first visit to the ophthalmologist?" It is well to test the vision of the child between the third and fourth years and to make superficial examination of the eyes, but a thorough examination under cycloplegia should be made at about the start of the second grade in school, because it is then that the child really begins to use his eyes for prolonged close work, and a thorough check-up of the extraocular muscles and of the refraction is indicated at that time. If however, there is reason to suspect trouble before then such as poor vision, hereditary taint or latent strabismus, obviously the careful examination should be made earlier. Simple talks on hygiene should be given in the lower school grades, and elementary care of the eyes should be included in them. If no abnormality is found in the eyes at this time, it is suggested that reexamination be made every two years thereafter. If a pathologic condition is found, more frequent tests are indicated. Yearly checks on the vision should be made by the school physician and each child questioned as to symptoms of eyestrain. The period of childhood cannot be passed over in this discussion without a sincere plea for the elimination of dangerous toys. Within the last four months there have been seen in my own practice four eyes that have been destroyed by air rifles, five others in the Washington University Eye Clinic and two in the service of another of the doctors in the clinic. The air gun is too dangerous to be placed in the hands of youngsters. I have yet to see useful vision retained in an eye that has been penetrated by a missile fired from these deadly toys.

#### ADULT LIFE

The ocular hazards for early adult life are mostly the accidents of industry, and these have been greatly reduced by safety devices such as protective goggles for workers, guards on machines, improved lighting and shorter working hours. Poor illumination and long hours have been shown to occupy an important place in causation of eye fatigue and injury. Nevertheless, much remains to be done to give workers their greatest ocular efficiency.

In middle age one comes first on the misnamed presbyopia. At that age many for the first time consult the ophthalmologist. How frequently the patient says "Well, this is the first sign of old age." He jests about it but isn't very happy. Now is a good time to encourage him to make light of the matter and to point out the good things about his eyes and the relative unimportance of this to him epochal event. Even a little preparation for its coming, if the patient happens to report in his early forties, is probably an advisable way to soften the jar when it does come.

One must at this time consider also glaucoma, which often has its insidious beginning at this age. A more careful study of patients in middle life and older with glaucoma in mind is indicated. More frequent tonometric measurements and studies with the convenient contact glass, which has an attached handle that renders its manipulation simple, should be made. For those who have a bad heredity for glaucoma or slightly shallow anterior chambers, a small amount of pilocarpine in an eye wash for daily use may prove to be valuable. Here again better education of physicians, of the public and of all those whose business is the care of the eyes is needed. This subject is too vast for more than mention here.

There are not many who can truly say with Rabbi Ben Ezra "Grow old along with me, the best is yet to be." More often the feeling of those entering what may possibly prove to be for them life's last decade is more accurately expressed by Jeremiah's lament "The years draw nigh when thou shalt say 'I have no pleasure in them'." If ever a physician is needed, it is when the knees weaken, the hands shake and the sight dims. In these latter years, when the reparative processes are feeble and the incidence of cataract, retinal and corneal degenerations and glaucoma becomes frequent, the help of a wise and understanding physician is indeed a godsend.

#### THE DEGENERATIVE DISEASES

But is there nothing that can be done to aid in defeating these diseases or degenerations that beset old age, or, if not cure the lesions themselves, at least aid those who are afflicted with them? The end result of these pathologic processes is reduced vision, and this curtails reading especially, that greatest pleasure of old age, when of necessity life becomes sedentary and interests are narrowed—a reversal of the expansion that takes place in youth.

To consider for a moment the subject of reading, one factor that must not be overlooked is the importance of adequate illumination. Far more brilliant lighting is not only welcomed but is needed in age than in youth. By increasing the twenty-five foot candles chosen by the young to seventy-five, not only is the vision of the elderly helped but comfort is greatly increased. If one doubts the value of increased illumination let him try his own added ability to read fine type when the normal light is greatly augmented.

But more important than this one practical point is the broad question of how best to conduct the fight against the inroads of age, as exemplified by retinal arteriosclerosis with subsequent hyaloid retinal degenerations, cataracts and other items. Unfortunately we cannot go back to the beginning and pick parents with long life in their veins, and there is little local treatment that has any value once these regenerative changes are well established, so it behooves us to make every effort to recognize early senile variations and combat them through general preventive measures as fully as possible.

Carrel long ago showed that a group of embryonic heart cells properly nourished and freed from waste were potentially immortal. It is a fair deduction that at least a large part of our degenerations are due to the toxins of waste products, while another important share is probably caused by toxins from infections. Search for these, and their elimination is obvious therapy. It therefore is evident that the person with early senile changes in his eyes undoubtedly has similar processes elsewhere in his system and should restrict his energies, nervous as well as physical, recognize that more rest is required and that indiscretions of diet are no longer tolerated. Foods which were innocuous in the youth who could burn up his toxins by violent exercise may be poisons to the sedentary old person. Allergic individuals are well aware that the food which will produce headache during the night if eaten shortly before retiring may be consumed with impunity at noon. By this token one should not give up exercise too completely but should carry it on within reasonable limits. With approaching age sleep comes easier but its tone is lighter, less resuscitating, shorter than earlier in life. The busy man fights against this. He tries to do as

much on the shorter, lighter sleep as he used to do on the longer deeper sleep instead of dividing his work period by a real rest which may well include a brief sleep in the middle of the day.

Probably circulatory inadequacy plays a most important part in the ocular degenerations. More study is needed to determine the nature and beginning of these vascular lesions, whether arteriosclerotic or atherosclerotic. Suitable diets such as those which limit fat formation, are probably important perhaps equally so are those factors which are concerned with proper posture, the weakened abdominal muscles permitting protrusion of the abdomen from improper stance which in turn causes a pulling down on the diaphragm and serious interference with the proper functioning of the great vessels and the heart.

#### VITAMINS, PHYSICAL THERAPY

Without doubt the recent discoveries about vitamins have been of tremendous importance to our health and longevity. Little is yet known and most of our therapy is random but surely age produces deficiencies caused by lack of assimilation of the frequently inadequate vitamins from the foods and environment as well as witnessing the end results of their undersupply through the previous years. At present we must be satisfied with more or less shotgun prescriptions of them in the hope of bringing down a quarry or two.

Another method of aiding the blood supply in the retinal degenerations is by heat. Here there are three methods of application: hot packs, infra-red rays and diathermy. By the first of these the orbital temperature just behind the globe can be raised some 3 degrees, by the second a degree or two more, and by the last an additional degree or two. Hot packs for twenty minutes two or three times a day are a simple treatment and may have some value. An infra-red hand lamp is inexpensive and a very convenient method for applying heat. The diathermy instrument is usually not available in the home and frequent treatments are necessary so this method is seldom advocated. A last therapeutic adjuvant is the vasodilating drugs such as acetylcholine or nitrites.

Time will not permit more than this hasty and very incomplete summary of a vast subject. Syphilis, tuberculosis, cataract and countless other important subjects have not been discussed. This may serve, however, as an introduction to the symposium on geriatrics that is to follow, in which we may hope to hear much more in detail. Perhaps the point has been made that many of the important adverse elements which often occur in eyes during a long life can, by foresight, to a large extent be prevented.

Metropolitan Building

---

**Immunity to Virus Disease**—Many workers in this field believe that a lifelong immunity to a second attack of a virus disease is due to a persistence of the virus in the recovered host. Inasmuch as circulating antibodies against yellow fever virus have been found in a recovered host for as long as fifty years after an attack of the disease during which time no further contact with the active agent has occurred, the statement just made about persistence of virus is particularly applicable to yellow fever. Such a persistence does not mean that an immune individual is capable of spreading disease, because it is most likely that the virus is stored in some remote part of the body within living cells where it cannot come in contact with circulating antibodies and from which point it cannot for one reason or another, reach the outside world.—Rivers, Thomas M. *Immunity in Virus Infections*. *Science* 85:108 (Jan 30) 1942

## MUSCLE SPASM IN THE ACUTE STAGE OF INFANTILE PARALYSIS

AS INDICATED BY RECORDED ACTION  
CURRENT POTENTIALS

R. PLATO SCHWARTZ, M.D.

AND

HARRY D. BOUMAN, M.D.

ROCHESTER, N. Y.

The first account in the eighteenth century of the clinical characteristics of infantile paralysis is a subject of controversy which centers around Michael Underwood in 1784. This date may therefore be accepted as a beginning of the modern concept of this disease.

The particular behavior and the extent of infantile paralysis have made it a world problem. Because of its epidemiologic characteristics it has become common to many countries, with an increasing incidence during the past fifty years. It is primarily a disease of childhood, but adults are not immune to its provocation of death and deformity. These multiple threats of physical deficiency have intensified the search for methods of control and treatment during each succeeding decade. Although methods of preventing infantile paralysis have not been discovered there has been developed an established attitude toward the treatment of patients during the acute stage of infantile paralysis.

In 1928 Jeremiah Milbank regarded infantile paralysis as "the most dreaded ailment of childhood."<sup>1</sup> He conceived, organized and financially supported the International Committee for the Study of Infantile Paralysis. In 1932 this committee, with Dr. William H. Park as chairman, published a five hundred and sixty-two page summary compiled by the fifteen members and forty-three investigators. The forty-four page bibliography, which is critically analyzed, represents more than eight thousand references. This work was accepted by the reviewer of the book as the "sum of human knowledge" on infantile paralysis at that time.

From this source the chapter on symptomatology, which includes physical manifestations, makes no reference to muscle spasm per se.

Hyperesthesia is often an early symptom more diagnostic than fever, which of course occurs at the onset of most infections. This hyperesthesia may be quite general and elicited by the slightest touch, but is usually more marked along the spine and over the large nerve trunks and is demonstrated by somewhat deep pressure. In dealing with very young children it is difficult to differentiate between pain due to hyperesthesia and that due to passive motion.

There is often pain in neck, back, abdomen or extremities. At times the pain in an extremity presages an oncoming paralysis. The pain varies greatly in severity. The duration is usually short but in some instances the neuritic pains may persist even into convalescence.

Tremors or twitchings of groups of muscles are occasionally early symptoms.

Meningeal symptoms occurring early are anterior-posterior stiffness of the neck and especially, of the back, often a Kernig's sign and Brudzinski's and Macewen's signs. The stiffness of the

<sup>1</sup> Poliomyelitis. A Survey Made Possible by a Grant from the International Committee for the Study of Infantile Paralysis organized by Jeremiah Milbank. Baltimore: Williams & Williams Company, 1932.

neck and back was noted by Coverly in 1894 and the importance of this symptom has been emphasized by numerous writers since that time. Although less marked than early meningitis it is probably due to the same factor, namely, an inflammation over the posterior nerve roots, which causes pain when the spine is flexed.

A description of the early symptoms gives a very inadequate picture of the disease. The severity and nature of the symptoms listed varies in different outbreaks, and especially in individual patients. In some patients the meningeal symptoms are particularly marked, in a smaller number disturbances of the sensorium, in others the pain and hyperesthesia, in still others, the tremors, muscular twitchings, and other motor phenomena, and occasionally in others, disorders of the gastrointestinal or upper respiratory tract.

In addition to this 1932 summary of opinion relevant to tenderness on deep pressure and passive motion, hyperesthesia, stiffness of the neck, tremors and muscle twitchings, Lovett's<sup>2</sup> emphasis of tenderness is pertinent.

The stage of onset. It covers the period from the beginning of the illness until the disappearance of the tenderness, because the tenderness must be accepted as evidence of an active process still existent in the cord. In those exceptional cases where tenderness is absent, this stage may be assumed as lasting from four to six weeks.

Tenderness. This symptom may vary from slight tenderness on pressure to a condition of exquisite sensitiveness to touch, jar or movement. It is located either in the affected muscles or is widespread over the affected region. In an analysis made in the New York cases it was found that in 57 cases, in which tenderness existed at the time when the patients were seen in the clinic, the longest duration of tenderness had been sixteen weeks. The average duration is about six weeks, but tenderness can be prolonged almost indefinitely by massage, active movements given too early, osteopathy, chiropractic treatments, and other forms of manipulation, and a persistence of this condition over three months is in most cases likely to be explained in this way. This exceedingly important symptom has received too little attention, but exists in nearly all cases and is one of the most important guides to diagnosis and treatment.

The appearance of tenderness often masks the condition and leads to incorrect diagnosis, and it must be remembered that tenderness is a routine symptom in the majority of cases.

These statements have been quoted with the conviction that they represent the accepted behavior of symptoms and physical signs in skeletal muscles during the acute stage of infantile paralysis. Lovett was particularly emphatic regarding the significance of these symptoms as related to diagnosis and treatment. These criteria taken as a whole constituted the premise from which the profession established its attitude toward the diagnosis and treatment of infantile paralysis in the acute stage. Careful observations recorded throughout the world during fifteen decades were required to gain this much in common agreement.

A point of view which would differ from the understanding established by one hundred and fifty years of work has now been expressed by Miss Elizabeth Kenny.<sup>3</sup> The preface of her textbook *The Treatment of Infantile Paralysis in the Acute Stage* begins with the following statement: "Since the year 1933, I have been endeavoring to present to the medical world the fact that spasm is a damaging and ever present symptom of the disease infantile paralysis." The

treatment of these symptoms combats pain, stiffness, deformities and minimizes the degree of paralysis."

In accordance with this concept of spasm in the acute stage of infantile paralysis, Miss Elizabeth Kenny has recommended and demonstrated a method of treatment to diminish the "damaging and ever present symptom of this disease." Clinical observations made in Australia, England, Canada and the United States have fostered approval of the departure from passive splinting to active treatment in the acute stage of this disease. The recent increase in favorable clinical observations has not been accompanied by evidence from any other type of clinical investigation. For these reasons it was necessary to approach this question of muscle spasm by a method which would be independent of, but could be correlated with, clinical observations.

Action currents are among the means most suitable for recording extremely minor contractions of muscle in situ. The rigid principles that define the technique of this method were applied to the study of patients (1) 7 with infantile paralysis, (2) 3 with spastic paralysis and (3) normal subjects for control.

In all instances oscillographic records of muscle action currents were made through a four stage amplifier. This amplifier has a balanced in-put system which reduces those potentials not generated between the electrodes applied to the skin overlying the muscle under investigation. Stetson and Bouman<sup>4</sup> have shown that it is quite possible to make records of different muscles without significant interference from the related antagonist.

#### SPASTICITY

A particular pattern of action current records is established as definite evidence of muscle spasm. In some instances spasticity can be recorded in muscles at rest. However, Hoefer<sup>5</sup> has revealed that even in spastic paralysis it is usually possible to find a position of complete relaxation in which characteristic action currents are almost completely absent. Independent of cause and degree, muscle spasm in a muscle will be revealed in the action current records made on passive movement of the muscle. Under this condition the muscle does not actively contract, so there is no action current of voluntary contraction in such a record. The most common way of evoking spasticity in a muscle is by a fairly sudden stretching of the muscle (fig 1). Both records were taken from the gastrocnemius muscle during and following the quick passive dorsal flexion of the foot. Record A shows the action current response of a normal gastrocnemius, record B reveals the characteristic action current of a spastic gastrocnemius in an adult with typical spastic paralysis.

The importance of these patterns of action currents from respective muscles becomes increasingly apparent as they are compared with the subsequent records from the muscles of infantile patients. The first comparison is in relation to Miss Kenny's observation that there is spasm in the antagonists of muscles weakened by infantile paralysis. Figure 2 illustrates a record made during the passive movement of the antagonist of a weakened muscle. The continuous flow of action currents is typical of a spastic muscle as in record B.

of figure 1. We have found this action current pattern, which is characteristic of muscle spasm in all records which we have made of the antagonists of muscles weakened by infantile paralysis. Our data therefore appear to support the statement that the weakening of a muscle in the disease infantile paralysis is accompanied by spasticity of the antagonist.

In the course of accumulating these records this evidence of spasticity in antagonists provoked other important questions. First among these: Is spasticity limited to the antagonist of the weakened muscle? To answer this we investigated the antagonists of muscles which showed no evidence of weakness on physical examination of our patients. The record reproduced in figure 3 is typical evidence of spasticity in those muscles despite the absence of demonstrable weakness.

That this spasticity can be very strong is demonstrated by the record shown in figure 4, which is the record obtained from the neck muscles of a patient. In this patient the disease had weakened only the muscles of the lower extremities. Record *A* was obtained by slow passive movement of the head. This figure also demonstrates the action currents in the same muscles in a resting position. Record *B* shows the action currents obtained. Hoefer found in spastic paralysis that it is almost always possible to find such a position for a spastic limb that the muscles show almost no action currents at all. Figure 4C shows another record of the neck muscle with the head supported in a position slightly different from the one reproduced in figure 4B.

Fig. 4—Records from neck muscles of patient suffering with infantile paralysis. *A* slow passive movement of head. *B* head supported in resting position. *C* head supported in resting position for minimum of action currents. Length of calibration arrow is potential of 10 microvolts. Time unit is one-tenth second.

The change between the two positions is only a few degrees. It is clear therefore, that in the resting muscle in infantile paralysis patients a position can usually be found in which the action currents disappear almost completely, but a position which is only slightly different may cause the action current to reappear.

It appears, then, that the spasticity in infantile paralysis is much more generalized than has been previously suggested: not only antagonists of paralyzed muscles show evidence of it but also muscles in parts of the body where no clinical evidence of muscle weakening can be found. The question arises: Does the muscle weakened by the disease show any evidence of spasticity,

Fig. 7—Records from very weak muscle of patient with infantile paralysis. *A* maximal voluntary contraction. *B* spasticity record obtained by stretching of the antagonist. *C* spasticity record obtained by contraction of an antagonist. Length of calibration arrow is potential of 10 microvolt. Time unit is one-tenth second.

or does it show only decrease in contraction strength? Figure 5 shows the action current evidence on this point. Records were made from the gastrocnemius and its antagonist in the same patient. *A* shows the contraction record of the left gastrocnemius. *B* shows the contraction record of its antagonist (anterior tibial). *C* and *D* are the respective spasticity records on the same muscles. It is obvious from the records, as it was obvious from the records of all weakened muscles, that spasticity occurs also in the weakened muscle itself. It can be said, therefore, that in infantile paralysis spasticity is a general feature not limited to the antagonists of the weakened muscle but present also in the weakened muscle itself and in many other muscles in which no clinical symptoms of weakening are present.

How can the spasticity in the muscle of infantile paralysis patients be evoked? In the first place it is necessary that the muscle under examination is not completely paralyzed. In those muscles in which voluntary contractions are completely absent spasticity cannot be found. Figure 6 shows a contraction and a spasticity record of a completely paralyzed muscle. Neither shows any evidence of action currents. In the second place it is important to determine in which ways the spasticity of the weakened muscle can be made to appear. We have already seen that passive stretching of the muscle is a common and effective way to produce spasticity. However, it was found that there are other possibilities involving the antagonist muscle. In figure 7 are reproduced three records obtained from the same muscle that was considerably weakened by the disease and recorded in succession with the same electrode arrangement. Record *A* shows a maximal voluntary contraction. *B* shows a spasticity record obtained not by stretching the muscle itself but by stretching its antagonist, and record *C* shows the spasticity obtained by the contraction of the antagonist. Some important conclusions can be drawn from these records. They

show that the spasticity obtained in the reflex muscle is due to a reflex mechanism, because it is evoked by stretching or contraction of the antagonist. The spasticity we are dealing with, therefore, appears to be a true reflex spasticity and is not due to contraction developing in the muscle because of discontinuation of motor impulses.

Fig 9—Records on the same muscle as those of figure 7 nine weeks later. *A*, maximal voluntary contraction. *B*, spasticity record obtained by stretching of the antagonist. Length of calibration arrow is potential of 10 microvolts. Time unit is one tenth second.

In fact figure 6 shows that in those muscles in which no motor impulses reach the muscles spasticity is not found. In the second place it is obvious that the weakened muscle behaves quite differently from normal muscles. In normal muscles contraction of the antagonist inhibits the muscle, in the muscle weakened by infantile paralysis contraction of the antagonist seems to evoke spasticity. We must conclude, therefore, that the reflex mechanism of the spinal cord is considerably altered in cases of infantile paralysis. The recordings in figure 8 show that spasticity developed by stretching the antagonist (record *A*) can actually be greater than spasticity developed by stretching the muscle itself (record *B*). In the third place it may be seen from the records of figure 7 that the spasticity developed in the muscle by reflex action can actually be stronger than by maximal voluntary contraction. It appears, then, that in infantile paralysis there is a dissociation between the voluntary and the reflex excitation of the weakened muscle which in a normal muscle does not exist.

How does the spasticity change when the patient improves under treatment, especially under treatment of the Kenny type? All our patients show that when under treatment the strength of contraction increases and the spasticity decreases. To demonstrate this, figure 9 shows action current records of the same patient on which the records in figure 7 were taken but recorded at a later date. Comparison of record 9 *A* with 7 *A* shows a definite increase in the possible voluntary contraction, a considerably larger number of fibers has become active, as is shown by the larger number of action current spikes in the same time interval. Comparison of record 9 *B* with record 7 *B* shows that the spasticity has decreased sharply. Only a few spikes are left, showing that possibly only one or two motor units contribute to this record. Increase in voluntary strength is accompanied by decrease in spasticity. Figure 10 is another demonstration of this, taken from the stretch reflex of the gastrocnemius muscle. Record 10 *A* shows the stretch reflex while strong spasticity was present. Record 10 *B* shows the stretch reflex taken in the same manner after treatment had improved the muscle. It is obvious that this picture resembles the short stretch reflex obtained in a normal nonspastic muscle (fig 1 *A*).

The patient on whom the records of figure 7 and figure 9 were made showed considerable spasticity in his shoulder muscles. Since there was no sign of muscle weakening in these muscles they were not treated. Figure 11 shows two records of spasticity in the deltoid muscle. Record 11 *A* was taken at the same time that the records in figure 7 were taken and record 11 *B* was taken at the same time that the records in figure 9 were taken. The records show clearly that in the muscles of this patient which had received no treatment spasticity had not decreased appreciably.

The records reproduced in this paper are representative of a series of more than five hundred records taken on 7 patients in acute stages of infantile paralysis and on normal subjects and control patients with spastic paralysis. The series of patients covered the range of muscular involvement usually encountered.

#### CONCLUSIONS

Our results then seem to justify the following conclusions:

- 1 In infantile paralysis spasticity of the muscles exists not only in the antagonist of the weakened muscle but also in the weakened muscle itself and in muscles in parts of the body in which clinical symptoms of the disease are not evident.
  - 2 The spasticity is of a reflex nature and is not present in the completely paralyzed muscle.
  - 3 The spasticity can be stronger than the voluntary contraction that the muscle is able to perform, as adjudged by action currents.<sup>6</sup>
  - 4 When the strength of the voluntary contraction increases through treatment, the spasticity decreases.
- Our investigation has shown that spasticity is present in infantile paralysis. Whether the spasticity is actually

Fig 11—Spasticity records of deltoid muscle, no clinical symptoms in these muscles, no treatment given. *A*, record taken at same time as that of figure 7. *B*, record taken at same time as those of figure 9. Length of calibration arrow is potential of 20 microvolts. Time unit is one tenth second.

responsible for weakening of the muscle or whether it is a phenomenon which is merely another consequence of the disease is a question which cannot be answered at the present time.

CONVULSIONS PRODUCED BY THE  
INTRACRANIAL IMPLANTATION  
OF SULFATHIAZOLE

## PRELIMINARY REPORT

COBB PILCHER, M D

RALPH ANGELUCCI, M D

AND

WILLIAM F MEACHAM, M D

NASHVILLE, TENN

In an experimental investigation of the chemotherapy of intracranial infections we have made a preliminary study of the effects of the sulfonamide drugs on the normal dog's brain. The development of convulsions in a very high percentage of animals following the intracranial implantation of sulfathiazole prompts this preliminary report, as a warning against the clinical use of this drug in this manner.

In this study varying doses of three drugs (sulfanilamide, sulfathiazole and sulfadiazine<sup>1</sup>) were placed on the brains of normal dogs under intravenous anesthesia with soluble pentobarbital. The dura mater was closed over the drug. Subsequent determinations of the concentration of the respective drugs in cerebrospinal fluid and blood were made at frequent intervals, clinical findings were recorded, the animals were killed after varying periods and specimens of dura mater and brain were obtained for microscopic study. In control experiments, two additional procedures were employed: the same operation was performed but no foreign substance introduced, and, in another group, kaolin was introduced in amounts corresponding to the largest amount of the drugs employed.

A detailed report of the findings will be made later. The present report is concerned with the incidence of the convulsions and the absorption of the drugs.

## OBSERVATIONS

A summary of the findings is shown in the accompanying table. The convulsions were classic Jacksonian seizures usually beginning in the contralateral facial muscles and exhibiting a typical "march." The attacks were observed in all animals in which 0.066 Gm of sulfathiazole per kilogram of body weight was employed (this amount corresponds to 5 Gm employed in a normal man) and in high percentages of the animals with smaller doses.

In many experiments with sulfanilamide convulsions were observed in only 1 animal, and they did not occur in any of the experiments with sulfadiazine. None of the control animals with kaolin or without implantation of any drug developed convulsions.

At necropsy, even of animals killed weeks or months after implantation of the drugs, the drugs remained as hard plaques adherent to the cortex (sulfanilamide tended to be somewhat softer, forming a very thick paste). At no time did sulfathiazole or sulfadiazine appear in either cerebrospinal fluid or blood in significant concentration. Sulfanilamide, somewhat more soluble, appeared in low concentrations when the larger dosage was employed.

Because Hurteau<sup>2</sup> has reported somewhat similar experiments in cats without the occurrence of convulsions, sulfathiazole (0.066 Gm per kilogram) was implanted on the cerebral cortex in 2 cats and 2 rabbits. Both rabbits and 1 of the cats developed convulsions.

Sulfathiazole was then implanted in a small area of cortical excision in 6 dogs, as carried out by Hurteau. One of these dogs had a single convulsive seizure on the third postoperative day. No other convulsions were observed.

## COMMENT

It is apparent that in animals the intracranial use of sulfathiazole is a dangerous form of therapy. Since these experiments were completed, Watt and Alexander<sup>3</sup> have reported almost identical results in cats and dogs after implantation of sulfathiazole intradurally. They did not observe convulsions when the drug employed was sulfanilamide, sulfapyridine, sulfadiazine or sulfacetamide.

*Incidence of Convulsions and Absorption of Drugs in All Groups of Experiments*

Dogs were used in all experiments except where otherwise specified.  
† Indicates less than 0.5 mg.

Similar results have been observed in man. Watt and Alexander<sup>3</sup> reported convulsions in 5 patients in whom sulfathiazole had been placed in craniocerebral wounds, all of which were frontal in location. Two of these patients died in status epilepticus. Naffziger<sup>4</sup> has had 1 similar patient, who went into a status epilepticus, and Watt and Alexander<sup>3</sup> mentioned a case reported to them by Rogers which was almost identical with that of Naffziger. Germain and Picard<sup>5</sup> and Lemierre<sup>6</sup> have reported paraplegia following intrathecal injection of the sulfonamides.

Sulfanilamide and sulfadiazine do not appear to have the same irritating effects on the cerebral cortex, but until microscopic studies are completed no conclusion can be drawn in this regard. For the present, the experiments reported herein constitute a clear warning against the intracranial use of sulfathiazole.

The customary plans for full digitalization involve distribution of dosage in such a manner as to produce the full effects within two or three days. The period is frequently shortened by the use of larger doses. The average full dose of digitalis given at one time is rarely recommended except when the condition is desperate, the reason being that it is too large for the more sensitive patients and results in toxic symptoms. The extent of the variation from the average response to an average full dose would theoretically be reduced by a preparation of digitalis which would be more quickly

and more regularly absorbed from the gastrointestinal tract. With such a preparation, single dose digitalization might prove to be a safe and satisfactory routine.

Our experience with digitoxin<sup>1</sup> during the past few years suggested that this material might be put to use in that way. It has long been known that digitoxin is very well absorbed from the gastrointestinal tract.<sup>2</sup> This was confirmed in our laboratory in experiments on cats showing that absorption is virtually complete.<sup>3</sup> The animal in which vomiting is prevented by morphine frequently dies in from two to six hours after an average

intravenous fatal dose (cat unit<sup>4</sup>) given orally. After larger oral doses (four to ten intravenous fatal doses) absorption is usually sufficient to cause death within less than an hour, even without morphine to prevent vomiting.

The rapid onset of effects after oral administration may in part be due to the fact that digitoxin is rapidly absorbed directly through the wall of the stomach.<sup>5</sup> This does not apply to all digitalis glycosides.

Observations on patients show that digitoxin is also rapidly absorbed from the gastrointestinal tract in man. This fact was determined for patients with auricular fibrillation and varying grades of heart failure. They were in bed in the hospital. The ventricular rate was counted three times daily and the average recorded as a point on the chart, during a control period of a week or longer until the rate reached a fairly constant level. They then received a single full digitalizing dose. Apex counts were then made at intervals of approximately one hour in most cases throughout the day. In the subsequent days the record was made in a manner similar to the control period prior to the drug. Intervals of at least three weeks elapsed between courses. Chart 1 shows the course in each of 4 cases. If one judges absorption from the decline of the ventricular rate, it may be noted that absorption is virtually complete within four to ten hours. These are typical of fifteen digitalizations in 12 cases of auricular fibrillation and congestive heart failure varying from mild to far advanced grades in which such detailed observations were made.

The single full dose in all but 1 of these cases was 3 cat units, or 126 mg. In 1 case a dose of 4 cat units, or 168 mg., was administered with substantially similar results.

A comparison of the oral and intravenous dosage provides a means for determining the completeness of absorption. After some preliminary explorations it was found safe to administer 3 cat units, or 126 mg., of digitoxin at one time by intravenous injection. This dose was given seventeen times to 15 patients in whom the detailed course of the effects was observed in the manner just described. In 6 of these patients the oral dose of 126 mg. was given at one time and the intravenous dose at another time for purposes of comparison. Chart 2 shows typical results of this comparison. The degree of effect following the intravenous dose is practically identical<sup>5</sup> with that following the oral dose except that it comes on more rapidly in some. It may be assumed therefore that for practical purposes the absorption of digitoxin from the gastrointestinal tract of man is virtually complete.

With this as a basis we endeavored to ascertain the safety of the single dose method of digitalization with this material in an unselected group of 213 patients with varying grades of heart failure, including patients with auricular fibrillation and regular sinus rhythm, some ambulant and others confined to bed. The character of this group is shown in table 1. They had been without digitalis for at least three weeks. Each received

4 The cat unit of digitoxin as determined by intravenous injection over the customary period of about seventy-five minutes is about 33 per cent larger than the absolute fatal dose. If injected at one time a smaller dose proves fatal after a longer interval. Also the cat unit of digitoxin as determined by the seventy-five minute injection period is 0.41 mg. but only 0.29 mg. in an injection period of four hours. However 75 per cent of the cat unit given orally, frequently also cause death, so that absorption is not far from complete.

5 The possibility exists that there may be some difference in the intensity of effects since the atropine test (Gold, Kwit, Ott and Felt)<sup>7</sup> to distinguish vagal from extravagal digitalization was not made in all cases, although the fact that the duration of action is often shorter suggests that the amount of glycoside involved in the two is not the same.

a single dose of 126 mg of digitoxin. The results are shown in table 2. The only toxic effects were those referable to the gastrointestinal tract. Of the entire group, 23 per cent showed nausea (none vomited) in an average of one hour and twenty minutes, in all

(Ciba). Chart 3 shows the results in two such experiments. In one 6 cat units by intravenous injection produced an effect almost as striking as 20 cat units given orally. In the other 3 cat units intravenously produced nearly as striking an effect as 15 cat units given orally.

Chart 4 shows 3 cases in each of which the doses of digitoxin and of digitalis which produced the same effects by oral administration are compared. Doses of from 12 to 20 cat units of digitalis leaf produced the same effects as 3 cat units of digitoxin by oral administration. Whether this result is significantly different from the results in which oral and intravenous digitalis are compared is uncertain and requires further investigation. The two groups of experiments (those of charts 3 and 4), however, point in the same direction and show that only about one seventh to one third of the potent materials in an oral dose of digitalis play a part in the total systemic effect.

The foregoing experiments show that 15 cat units of digitalis leaf or tincture may be taken as the average therapeutic equivalent of 3 cat units of digitoxin by oral administration in man. This is in substantial agreement with our previous findings.<sup>6</sup> This dosage for

Chart 1—Courses in 4 cases after administration of digitoxin (digitaline Natuelle) 3 cat units (1.26 mg) orally.

probability a local action. A similar number had gastrointestinal symptoms within an average of fourteen hours, due obviously to a systemic action.

Can the same result be accomplished by the use of digitalis leaf or the tincture? The results of animal experiments indicate that these might present difficulties. In animal experiments the contrast between the absorption of digitalis and of digitoxin is very striking. It is almost impossible to kill the cat by the oral administration of digitalis. The largest total amount which is absorbed after the oral administration of a single intravenous fatal dose is not often more than 30 per cent.<sup>3</sup> Such a dose causes vomiting in about 15 per cent of the animals from a local action, as shown by the fact that it occurs within about one and one-half hours, sometimes as early as ten minutes and when only about 10 per cent of the dose has been absorbed. Larger doses as large as ten times the intravenous fatal dose, given orally, cause enough diarrhea (vomiting prevented by morphine) to prevent fatal poisoning.

In regard to man, it is well known that digitalis leaf and tincture are among the best absorbed of the crude materials belonging to the digitalis group, including strophanthus, convallaria, squill and adonis. We investigated the extent of absorption of digitalis in man by experiments in patients with auricular fibrillation in whom the effects of oral and intravenous doses were compared, again making these comparisons in one and the same person. For this purpose two materials were used, one a liquid preparation of digitalis which contained all the glycosides of the leaf and the other a purified mixture of the glycosides of digitalis in the form of the product of commerce known as digitoline

Chart 2—Comparison of oral and intravenous dosage of digitoxin (digitaline Natuelle) 3 cat units (1.26 mg).

digitalis is in line with the experience of others.<sup>7</sup> Chart 4 furthermore shows that with such full doses of digitalis given orally at one time the effects may, in many cases, develop about as quickly as with digitoxin. We

therefore endeavored to ascertain the safety of the single dose method of digitalization with digitalis leaf and the tincture in a series of patients in a manner similar to that for digitoxin. Sixteen specimens of digitalis leaf or tincture were administered in a single dose averaging 151 cat units to a total of 161 patients. The results

are shown in table 2. As in the case with digitoxin, the only toxic effects were those referable to the gastrointestinal tract. The incidence of nausea and/or vomiting due to local action within less than two hours was very high. It rose from 23 per cent in the case of digitoxin to 19.3 per cent. The local emetic action was encountered with both the tincture and the leaf.

#### COMMENT

**Local Emetic Action of Digitalis**—The emetic action of the digitalis bodies took a prominent place in Withering's<sup>8</sup> description of the action of the drug in man in 1785. For a long time thereafter the belief prevailed that digitalis caused vomiting by direct action on the gastrointestinal tract. The literature has been reviewed by Hatcher and Eggleston.<sup>9</sup> The classic studies of Hatcher and his collaborators, Eggleston and Weiss,<sup>10</sup> directed attention to the fact that the digitalis bodies exert an emetic action after they have been absorbed. The available evidence leaves little doubt that vomiting from digitalis is due to an action either on some structure of the central nervous system or some sensory endings in the periphery (the heart), or both. The gastrointestinal tract is not essential, since in an animal a toxic dose of digitalis produces all the phenomena of vomiting except expulsion of gastric contents, even after evisceration.<sup>9</sup> The result of these studies has been that interest in the local (gastrointestinal) emetic action of digitalis has declined, and in the more recent writings the tendency has been even to deny its existence.<sup>11</sup>

The plan of our studies on the assay of digitalis in man required single full doses of digitalis. In many of these experiments the patient was in the hospital for three or four weeks for purposes of control. A large dose of digitalis leaf or the tincture was then given. Its effects were to be studied over a period of several weeks. These time consuming experiments, however, often came to an unexpected end when within some minutes after administration of the dose the patient became nauseated and vomited, losing some of the drug and vitiating the experiment. This seemed to occur much more frequently than our previous views indicated should be the case if the local emetic action of digitalis is as negligible a factor as we had supposed it to be.

Our own experience, as well as that of most others, has been that when patients are digitalized with a series of small doses given at intervals, vomiting is relatively rare until strong systemic effects are in evidence, it is in these cases clearly due to the systemic action of the drug. The present experiments show, however, that when very large doses of digitalis are given in man at one time, local emetic action in the gastrointestinal tract develops. Nausea and vomiting occur in from five minutes to two hours, long before the major part of the dose has been absorbed, as shown by the relatively slight effect on the heart rate. The nausea may last for as long as three or four hours. The susceptibility of a person to the local emetic action is extremely variable. Many of these patients received several doses

Chart 4—Comparison of oral dosage of digitalis and digitoxin (d. Nativelle)

of digitalis, often of the same preparation, and vomited after one or two of the doses and not after the other. In a given patient the doses of the same preparation which caused the vomiting were not always the largest ones.

The nature of the local action which causes emesis requires further study. We have examined the gastrointestinal tract of a cat which had severe nausea and diarrhea from the local action of large oral doses of

digitalis. These symptoms are not necessarily associated with inflammatory changes in the mucosa.

What accounts for the fact that digitalis causes gastrointestinal symptoms by local action so much more frequently than digitoxin when the two are given orally in therapeutically comparable doses? Impurities such as

The action was assumed to be local if it occurred within two hours and if little slowing of the ventricular rate had taken place. In the case of digitalis 2 patients are included in whom the interval was three and five hours respectively because negligible slowing had occurred at the time that vomiting appeared indicating little absorption.

fat and digitoxin have been charged with this action. Whether an impurity in digitalis plays any part cannot be stated. The fact remains that this action is not confined to crude materials. The cardioactive glycosides in purified form produce it. Table 3 summarizes some observations made in the course of other work with purified materials, lanatoside-C various mixtures of glycosides of squill, ouabain and digitofoline (Ciba). These experiments are not sufficient to reveal whether glycosides of the digitalis group vary in their local emetic potency. They point to the fact, however, that the local emetic action is related to the amount of the material given rather than to the cardiac potency of the dose (cat units). It may be seen that nausea or vomiting due to local action was for the most part confined to doses of the glycosides above 3.5 mg, doses below that failed to cause vomiting. For example, ouabain in oral doses of 2 and 3 mg failed to cause vomiting by a local action, although these doses amounted to 20 and 30 cat units, whereas the glycosides of squill frequently exerted the local emetic action in much smaller cat unit doses but the amount of the glycosides in these cases was considerably larger.

The larger amount of glycosides becomes necessary for therapeutic effects in the case of those materials which have a low cardiac potency and which are imperfectly absorbed. The local emetic action, as has already been noted, is rarely present in the case of digitoxin of which a total of only 1.26 mg is necessary for full digitalization by oral administration.

**Digitalization by the Single Dose Method**—There are several reports on the use of a massive dose of digitalis given at one time for full digitalization.<sup>12</sup> Robinson<sup>13</sup> gave from 15 to 25 cat units in a single dose to a series of patients under control in the hospital without encountering serious poisoning. He concluded that such doses are not dangerous when used under well controlled conditions, although he did not advocate the method as a routine practice. One out of 10 of his patients vomited within a few minutes, and a similar number had nausea within one-half to one hour. The more usual practice is to give the full dose, whatever it is estimated to be 1 or 1.5 Gm for a given patient, in four or five fractions, at intervals of six or eight hours to induce the full effects. One reason for the divided doses, as already stated, is the fact that systemic poisoning may result from a single full dose in the more susceptible individuals. Furthermore the fact that about 10 per cent of the patients may vomit shortly after the massive dose, as shown both in our own series and in that of Robinson, introduces a serious problem. Such a practice is likely to achieve precisely the opposite effect of what is intended by the single massive dose namely to delay satisfactory digitalization beyond what might have been possible with a series of small doses, since it is often difficult to determine what proportion of the dose has been lost in vomiting. To play safe it is necessary to wait for the full effects of the fraction that remains.

Since varying susceptibility as measured by oral doses includes the factor of varying absorption, it was considered that the digitoxin-like material which is rapidly and for practical purposes completely absorbed from the gastrointestinal tract, might provide a safe means of full digitalization by a single average dose. This has

TABLE 3—Local Emetic Action of Various Digitalis Glycosides in Man

\* The materials were given orally in a single dose at one time.  
† This material was available only in tablets or liquid hence the number of milligrams of active material is not stated.

proved to be the case. The full digitalizing dose of 1.26 mg may be given at one time to the patient with heart failure who has not recently received digitalis. It induces the full effects within six to ten hours and sometimes more quickly, within four hours. Only about 1 out of 50 patients under these conditions has nausea due to local action and a similar number

This and the photomicrographs reproduced in figures 4, 5, 6, 7 and 8 have been reduced slightly from the magnifications given.

were seen in the form of intermediate rows of spindle cells (fig 4b). The latter arrangement was the one most closely approaching the typical picture of adamantinoma described in connection with the jaw (fig 7b). The adenomatous arrangement conformed to Ewing's subgroup "glandular adamantinoma." In this pattern the stroma was not abundant and was composed of young connective tissue cells with some collagen.

Another arrangement frequently noted was that of small cuboidal cells in the form of solid islands or irregular anastomosing sheets (fig 5a). The peripheral rows of cells appeared in palisade formation, and the resemblance to basal cell carcinoma sometimes was striking. Occasional cystic change was noted in these otherwise compact cellular masses, and occasionally there appeared central groups of stellate

Fig 4—Glandular adamantinoma showing (a) irregular acini with strands of the epithelium, this mosaic pattern is highly diagnostic (hematoxylin and eosin,  $\times 155$ ), (b) a nest of "reticular" cells and transition of the latter to the columnar type of epithelium, compare with figure 7b, which depicts a typical adamantinoma of the jaw (hematoxylin and eosin,  $\times 210$ ).

"reticular" cells similar to those described in the preceding paragraph. This structural arrangement with its typical peripheral palisading recalled Ewing's "plexiform epithelioma" type of adamantinoma.

In still other regions the columnar character of the tumor cells was entirely lost and they assumed a more or less spindle

form, in brief, a picture of the "sarcomatoid" pattern (fig 5b), so commonly seen in adamantinoma (this has been reported in connection with the tibial variety but is rarely the predominant pattern). That the spindle cells represented not a different type but rather a variant of the columnar cells was demonstrated by transitions between the two (fig 6a).

Squamous cells were observed in several of the sections. They were usually in small compact groups and were occasionally seen to form epithelial pearls. No intracellular bridges were noted and keratohyaline granules were absent (fig 6b). These cells were regarded in the light of selective differentiation of the parent tumor cells. In case 2 this line was followed almost to the exclusion of all others, so that the tumor resembled a pure epidermoid carcinoma (acanthoma type of adamantinoma—Ewing<sup>9</sup>).

The stroma varied as did the epithelium in amount and in texture. In some regions the picture was that of wide bands of hyaline connective tissue enclosing semistrangulated nests of epithelial cells. In other zones the supporting element was small in amount and loose in texture. Blood vessels were fairly numerous throughout the tumor but did not offer any noteworthy features. The "invasion" of soft parts noted in the roentgenograms was not convincing microscopically. Involvement of muscle was expected, but the appearance was rather that of slow expansion of the tumor and of pushing aside such structures as muscles, nerves and tendons.

Fig 5—(a) plexiform epithelioma type of adamantinoma, note the solid anastomosing strands and sheets of small dark staining cells with attempted peripheral palisading, the resemblance to basal cell carcinoma is apparent (hematoxylin and eosin,  $\times 170$ ), (b) the sarcomatoid pattern seen in adamantinomas, here the cells are of the spindle type, somewhat pale staining and arranged irregularly like those in a sarcoma (hematoxylin and eosin,  $\times 155$ ).

Microscopic study of the skin over the lesion revealed a picture perhaps worth recording. The tips of the papillary pegs appeared irregular and hyperchromatic. Here and there budding masses of basal cells were seen growing into the underlying subcutis. In short, the appearance was that of multicentric, basal cell carcinoma in situ (fig 7a). While no actual connection could be traced between these neoplastic downgrowths and the underlying adamantinoma, one must remember that such a connection probably did exist prior to the first operation, when the overlying skin was excised. The point will be discussed subsequently.

As the microscopic examination of tissue from the material obtained at amputation provided little in the way of additional information, pertinent remarks will be limited to a description of the gross specimen. On sagittal section (fig 2) the tumor presented first a hemorrhagic cystic cavity, measuring 10 by 5 by 5 cm, at the recent operative site. Around the margin of this cavity the bony cortex was of eggshell thickness, and in the posterolateral wall there was a cortical defect measuring 3 by 2 cm and containing residual grayish red tumor material. This extended laterally into the soft tissue and

<sup>9</sup> Ewing, James. *Neoplastic Diseases. A Treatise on Tumors*. Philadelphia: W. B. Saunders Company, 1940. pp. 771-776.

partially surrounded, but did not involve, the shaft of the fibula. Of special interest, however, was the finding of reddish medullary and cortical nodules of neoplasm immediately above and below the large central cavity which presumably represented the main mass of the tumor. In the upper and lower ends of the tibia were found additional nodules which were grayish yellow, softer than the surrounding bony tissue and fairly well circumscribed. They varied from 1 to 4 cm in diameter and were practically all discrete. However the gross impression that these too were nodules of residual tumor was not confirmed microscopically, the sections revealing that they represented lesions of osteitis fibrosa.

A similar type of involvement in the lower third of the fibula constituted a finding which set the case apart from the previously reported examples of 'heterotopic' adamantinomas. The medullary cavity and the cortex of the bone were involved to such an extent that the shaft could be bent with the greatest of ease. The involvement again took the form of semidiscrete nodules similar to those found in the upper and lower ends of the tibia. As in the case of the tibia these nodules, grossly simulating tumor, proved on analysis to represent lesions of osteitis fibrosa.

**CASE 2**—A 27 year old white man first visited the clinic on Feb 21, 1939 complaining of "trouble with the left leg" seventeen years in duration. The patient stated that he had been well until the age of 10 years at which time he sustained

Fig 6—*a* transition between alveolar or glandular and sarcomatous patterns of tibial adamantinoma (hematoxylin and eosin  $\times 200$ ) *b* differentiation of the tumor cells into squamous epithelium with pearly bodies (hematoxylin and eosin  $\times 450$ )

a severe bruise to the left leg when he accidentally "stepped into a hole in the floor." Three years later the patient suffered a fracture of the left tibia when he jumped from a hay loft. The fracture healed in two to three months. Again, at the age of 16 years, fracture of the same bone "followed a bad step while running." Good union apparently was again secured. Following a third fracture at the age of 22 roentgenograms were taken which revealed an osseous cyst as possible background for the fractures. The cyst was excised three months later, but apparently no microscopic studies were done at the time. About one year before the patient's admission to the clinic (four years after excision of the cyst) pain and swelling developed over the left shin and the patient was hospitalized. The valuable surgical, pathologic and roentgenologic data which were obtained at the hospital and which were subsequently provided to us have made possible the diagnosis and presentation of this unusual tumor.

Essential descriptions of the roentgenograms taken when the patient was 22 years old are as follows. Dec 14, 1934 "re-examination of the shaft of the left tibia shows moderate evidence of resolution in the pathology (fracture with cyst). This is particularly evident in the portion of the shaft just below the line of fracture, where the large cyst which had been present is considerably smaller. There is also apparently resolution in the smaller cysts on the ventral aspects of the bone above

the line of fracture, although the line of the fracture is still visible indicating that complete union had not yet occurred." May 14, 1935, a "radiologic examination of the shaft of the left tibia shows findings which have been previously reported. The large area of rarefaction, more or less in the center of the shaft is definitely smaller at this time than it was at the

Fig 7—*a* skin overlying the tumor of the tibia the appearance is that of multicentric basal cell carcinoma (hematoxylin and eosin  $\times 175$ ) *b* typical adamantinoma of the jaw for comparison with fig 7*a* the palisaded basal cells are shown enclosing large islands of stellate reticulum transitional or intermediate cells are not well demonstrated

time of the last examination. The walls of this cavity are also somewhat thicker and sclerotic. The changes on the bone in the ventral aspect just above this cavity are of the same nature only not quite as extensive as they were at the previous examination. The distal end of the bone was not included in the plates made prior to September 1934. Two definite areas of rarefaction are seen in the cortical bone of the ventral aspect. These were not observed at previous examinations. These are probably areas of rarefaction resulting from embolic foci of infection which have spread through the haversian canals.

Roentgenograms taken in September 1938 demonstrated a healed fracture through the middle third of the body of the

Fig 8—Tibial adamantinoma differentiating along the line of fairly mature squamous epithelium (hematoxylin and eosin  $\times 170$ )

tibia. The cortex was thickened, and there was evidence of regions of rarefaction. On Sept 6, 1938 the cystic portion of the bone apparently including all the diseased portion had been "saucerized." The pathologist who had prepared the tissue and examined it microscopically recognized the striking dissimilarity of the neoplasm to the usual types of primary malignant lesion of the bone and suggested metastasis from a low grade epithelioma. This was ruled out clinically. Slides had been submitted to other eminent pathologists who first

suggested the diagnosis of atypical adamantinoma of the tibia. With this diagnosis the pathologist who first had examined the tissue concurred later, although, to put it in his own words, "In reading the original report if the word 'metastasis' had been omitted the histologic description would have been perfectly satisfactory for the final diagnosis."

It was then with this valuable advance information that the patient five months later was referred to the Mayo Clinic for consideration. Examination here disclosed little of additional importance. There was present on the anterior surface of the leg a cicatrix 7 inches (18 cm.) long. The underlying tibial margin felt rough. There was present a moderate degree of atrophy involving the muscles of the leg on the affected

side. From our last communication with the patient, in January 1941, we learned that he was "walking without the aid of a cane."

The photomicrograph (fig. 8) of the tumor afforded in this case is taken from material supplied us by the pathologist who examined the tissue removed in 1938. When we saw this tissue in 1939 our diagnosis was epithelioma, grade 1 (Broders' method). In retrospect now and as a result of comparison with the material from case 1 we agree with those who made the earlier diagnosis of atypical adamantinoma. The case therefore becomes almost unique in the extremely long duration of the lesion and the apparent response to the treatment employed.

Summary of Cases of Adamantinoma of the Tibia (Cases 1 to 15 Inclusive from Hebbel<sup>13</sup>)

| Case | Year | Author                         | Age, yrs. | Sex | Site                                   | Antecedent Trauma            | Latent Period | Character and Duration of Symptoms  | Initial Therapy                     | Subsequent Course   |
|------|------|--------------------------------|-----------|-----|--|------------------------------|---------------|-------------------------------------|-------------------------------------|---|
| 1    | 1913 | Fischer                        | 37        | ♂   | Junction lower and middle thirds, left | Contusion                    | 5 mo          | Pain, swelling, 5 mo                | Resection, bone graft               | No recurrence 8 mo later  |
| 2    | 1930 | Richter                        | 12        | ♂   | Middle third, left                     | Fall                         | ?             | Swelling, 8 mo                      | Amputation                          | Uneventful  |
| 3    | 1931 | Baker and Hawksley             | 46        | ♂   | Lower third, left                      | Contusion                    | 8½ mo         | Pain, swelling, 6 wk                | Resection, bone graft               | No recurrence 2 mo later  |
| 4    | 1932 | Ryle                           | 32        | ♂   | Middle third                           | Contusion                    | 8 yr          | Swelling, 8 yr                      | Curettage                           | Recurrence, amputation 6 mo later   |
| 5    | 1933 | Petrov and Glusunow            | 22        | ♂   | Middle third, left                     | None                         | None          | Swelling, 3 yr                      | Resection, bone graft               | No recurrence 1 yr later  |
| 6    | 1934 | Holden and Gray                | 36        | ♀   | Lower third, left                      | Abrasion, contusion of ankle | None          | Pain, 2 yr                          | Excision                            | Recurrence after 2 yr, reexcision, roentgen therapy of high voltage                 |
| 7    | 1937 | Bishop                         | 22        | ♂   | Upper third, right                     | Fracture                     | 8 wk          | Swelling, 3 yr                      | Curettage, chips, graft             | Recurrence amputation after 14 mo, 4 yr after fracture                              |
| 8    | 1938 | Rehbock and Barber             | 24        | ♀   | Lower third, left                      | Sprain of ankle              | None          | Pain, swelling, 18 mo               | Wide excision                       | No recurrence 8 mo later  |
| 9    | 1938 | Oberling, Vermees and Chevreau | 51        | ♂   | Middle third                           | ?                            | ?             | ?                                   | Excision                            | Recurrence amputation 7 mo later  |
| 10   | 1938 | Dunne                          | 32        | ♂   | Junction upper and middle thirds, left | Contusion abrasion           | 9 mo          | Swelling, 4 yr, pain later months   | Roentgen therapy of high voltage    | Progression amputation 9 mo later   |
| 11   | 1938 | Wolfort and Sloane             | 37        | ♀   | Junction middle and lower thirds, left | Contusion                    | None          | Swelling, 10 mo, pain 4 mo          | Excision                            | Recurrence in 16 mo, reexcision, no further recurrence 47 mo after first operation  |
| 12   | 1938 | Wolfort and Sloane             | 18        | ♀   | Lower half, right                      | Abrasion                     | 3½ yr         | Pain 4 mo                           | Curettage, radium                   | Recurrence, resection 13 mo later, recurrence again amputation after 12 mo          |
| 13   | 1939 | Thomas                         | 19        | ♀   | Upper right                            | None                         | None          | Swelling, 7 yr, pathologic fracture | Curettage, graft                    | Recurrence amputation 8 mo later  |
| 14   | 1939 | Rankin                         | 20        | ♂   | Lower left                             | Puncture wound               | 1 yr          | Pain, swelling, 1½ yr               | Curettage                           | Recurrence excision 13 mo later, no recurrence 9 yr after first operation           |
| 15   | 1939 | Hebbel                         | 14        | ♀   | Lower right                            | None                         | None          | Pain, swelling, 4 mo                | Curettage                           | Recurrence curettage 13 mo later, again recurrence amputation 2½ yr after operation |

† Designated as case 2 in text of this paper

side. Roentgenograms revealed a bony defect (operative) involving the middle third of the shaft of the bone with considerable bowing. The patient was given a course of local roentgen therapy and returned home.

In the interval between February 1939 and September 1940 the patient did not suffer from any major complaints. Some slight pain was noticed in the old operative scar and anterior bowing of the bone became apparent. However, a routine roentgenogram taken at the time of his second visit here, on Aug. 28, 1940, showed a widening of the old fracture line previously noted. Greatly increased density of bone was observed in comparison with older roentgenograms. The possibility of recurrence was considered, and accordingly on September 2 surgical exploration was performed through the previous operative scar. The bone was white and sclerotic. No definite tumor was encountered, and tissue removed for examination showed only the picture of sclerosis and lesions of osteitis fibrosa. The patient was dismissed on September 16, with the wound almost completely healed.

COMMENT

While conceding that the term "adamantinoma" is probably a misnomer, we are of the opinion that since it has become so well established in the literature nothing would be gained by insisting on the more correct designation of "ameloblastoma" for the neoplasms under consideration. Adamantinomas arise from cells which under certain circumstances lay down enamel but which may or may not do so. Enamel has not been found in the tibial tumors, and some pathologists for example, Robinson,<sup>10</sup> deny that it has ever been demonstrated in the mandibular, maxillary and pituitary tumors of similar microscopic configuration.

As regards the histogenesis of this type of neoplasm we favor the hypothesis of Ryle supported by

10 Robinson H. B. G. Histologic Study of Ameloblastoma. Path. 23: 664-673 (May) 1937

Broders,<sup>11</sup> that the neoplasms arise from squamous cells which dedifferentiated into modified ameloblasts. We do not feel the necessity of postulating for the mandibular maxillary pituitary or tibial types the almost mythical occurrence of anatomic cellular rests. The prodigious capacity of cells to dedifferentiate is seen in the many examples of epidermoid carcinomas occurring in sites like the lung and gallbladder where squamous epithelium does not normally exist. In case 1 of our series we have seen in the epithelium overlying the tumors changes which suggested multicentric basal cell carcinoma. Although we were unable to demonstrate actual connection between these neoplastic pegs and the underlying tumor a similar picture could be found in the latter. In adjoining regions could be found a picture closely simulating adenocystic basal cell carcinoma. Epithelial pearls in still other regions indicated transition to fully differentiated squamous cells, and in case 2 the entire configuration of the tumor was almost that of a typical epidermoid carcinoma. In case 1 the arrangement often seen was that of palisaded cylindric cells, intermediate cells and stellate reticular cells in a triunivrate typical of adamantinoma of the jaw. By adding to these the picture of oval cells arranged in a diffuse or sarcomatoid pattern one obtains a veritable combination of tumor patterns, all on a basis of cellular dedifferentiation.

The part played by trauma in the production of these tumors is difficult to evaluate. The criteria laid down by Bell<sup>12</sup> in connection with the traumatic origin of neoplasms cannot be fulfilled in all tibial adamantinomas even when trauma is present in the patient's story. On the other hand the life history of such a tumor is very unusual in that it concerns a malignant lesion with an extremely slow rate of growth. As pointed out by numerous investigators, the anatomic location would favor a traumatic causation. The sharp anterior margin of the tibia provides the background for a vertical shearing type of injury of the overlying skin, and such injuries in this part of the body are very common. Whether such injuries "implant" epithelial cells into the periosteum of the underlying bone and, if they do so, what type of "thwarted repair" (Ryrie) process might give rise to tibial adamantinomas are matters which still are lacking in actual demonstration. It is interesting, however, that where nature provides such a possibility, *par excellence*, these tumors make their appearance to the exclusion of other situations. Case 2 furnishes an instance of such atypical trauma. Although no definite history of severe injury existed in case 1, the patient was a basketball player and undoubtedly was exposed to more than average danger in this regard.

Of particular interest in case 1 was the unusual and unexpected extent of the tumor. This observation has been made by others (Dunne) and undoubtedly accounts for the high "recurrence" rates observed following even such semiradical operative procedures as excision with bone grafting. Undoubtedly such an outcome would have ensued in our first case had any type of conservative operation been attempted. Such extension was probably not present in the second case, but in the light of the experience of others, it is perhaps yet too early to disregard the possibility of recurrence of the neoplasm.

The same degree of osteitis fibrosa present in both cases is of unusual interest. It is probable that this picture confused the roentgenologists who were led to believe that the fibula was secondarily involved by the tumor in case 1. Just why this localized bony rarefaction should occur we are at a loss to explain unless perhaps it represented a nutritional change resulting from circulatory obstruction by the tumor.

Finally Hebbel<sup>13</sup> in his recent review has summarized in tabular form most of the essential data pertaining to previously reported cases of tibial adamantinoma. It is with his consent that we reproduce this table and add to it our own 2 cases of this unusual neoplasm.

#### SUMMARY

In 2 new cases of tibial adamantinoma the disease had existed over a long period. Trauma appeared a probable etiologic factor in 1 case and a possible factor in the other. In 1 case amputation was performed because the lesion proved extensive beyond all expectation. Conservative operation apparently temporarily arrested the lesion in the second. Evidence proves that tibial adamantinomas are merely modified squamous cells which vary considerably in their differentiation into ameloblasts.

### TUBERCULOUS BACILLURIA

#### A TEN YEAR STUDY

W. H. ORDWAY, M.D.

AND

E. M. MEDLAR, M.D.

MOUNT MC GREGOR, N. D.

The concept that tuberculous infection of the urinary tract arises as a result of the distribution of tubercle bacilli through the blood stream is now generally accepted. That the presence of tubercle bacilli in the urine signifies the presence of a tuberculous lesion in the kidney, provided genital tuberculosis is ruled out, in the male especially, is still a much disputed point. There are investigators notably in continental Europe, who still maintain that tubercle bacilli may be excreted from the blood stream by a healthy kidney without a tuberculous lesion in the organ. The theorem that organs such as the liver, intestine and kidneys can excrete bacteria from the blood stream as a sort of physiologic function originated with Cohnheim,<sup>1</sup> who formulated the idea without any careful experimental investigations to support such a postulate.

Shortly after Cohnheim presented this theory, Wyssokowitsch<sup>2</sup> published a thesis, based on very painstaking experimental investigations which completely refuted the concept of physiologic excretion of bacteria. This article is a classic and should be read with great care by all who maintain that normal organs excrete bacteria as a part of their normal function. Cohnheim's postulate gained a considerable number of adherents, especially among clinicians and surgeons, primarily because it gave an easy and if true, a plausible explanation for the presence of bacteria of one sort or another in the urine of patients who had no clinical evidence of an infection of the genitourinary tract. The controversy over the

12 Bell E. T. A. Textbook of Pathology, ed. 4 Philadelphia: Lea & Febiger 1941 p. 251.

significance of bacteria in urine led to a number of careful and, in some instances, ingenious experimental investigations. In the United States painstaking researches of Helmholtz<sup>3</sup> refuted the idea that normal kidneys can excrete bacteria and also demonstrated that the technic used by some investigators, such as inserting catheters and leaving them in ureters that had been dissected free from the bladder, was responsible for certain positive findings. The researches of Sherrington,<sup>4</sup> Dyke,<sup>5</sup> Lepper,<sup>6</sup> and Kirkpatrick<sup>7</sup> in the British Isles and of Lieberthal and von Huth<sup>8</sup> and Montgomery and Allen<sup>9</sup> in the United States likewise have failed to support Cohnheim's postulate. Since there are numerous papers in which this whole controversial point is reviewed, no further discussion of the general question will be presented.

Among those investigators who still maintain that tubercle bacilli can be excreted by normal kidneys and that the existence of healed tuberculous lesions in the kidneys has not been proved are Deist<sup>10</sup> and Stenholm<sup>11</sup>. In the majority of reports supporting the "excretion without lesion" hypothesis reference is made to the original report of Foulerton and Hillier<sup>12</sup>. In this article, 7 patients who had had tubercle bacilli in the urine without clinical symptoms of genitourinary involvement came to necropsy, and evidence of renal tuberculosis was found in only 1. Later Medlar and Sasano<sup>13</sup> and Medlar<sup>14</sup> demonstrated that it was not possible to rule out tuberculous lesions in the kidney unless serial microscopic sections of the whole of both kidneys were made. While such a procedure involves a large amount of work, it remains imperative that those authors who seriously desire to support the "excretion without lesion" hypothesis fulfil this criterion of serial sections before they can maintain that their necropsy findings represent the fact. Some investigators as, for instance, Mack<sup>15</sup> and Deist,<sup>10</sup> have resorted to modified serial sections and have reported negative postmortem findings in cases in which tubercle bacilli had been demonstrated in the urine during life. On the other hand, Band,<sup>16</sup> using the serial section method, demonstrated bilateral tuberculous lesions in each of 5 patients who had excreted tubercle bacilli during life and who failed to show macroscopic evidence of renal tuberculosis at necropsy. Medlar and Sasano

have proved beyond question that tuberculous lesions shedding bacilli into the collecting tubules of the kidney may be so minute that they can be detected only by the use of the microscope.

The healing of tuberculous lesions of the kidney is still questioned by many investigators. Deist and Stenholm did not accept as evidence of healed tuberculous lesions the scars referred to by Medlar as probable healed tuberculous foci. Medlar stressed the fact that it is not possible to prove that such scars are healed tuberculous lesions since there is not a pathognomonic scar for tuberculosis in any tissue. He also pointed out that if tuberculous lesions in the kidney do not heal it is the only tissue of the body in which such a condition exists.

MATERIAL AND METHOD

To demonstrate tubercle bacilli in the urine is one thing. To determine the significance of such findings and to institute a course of treatment in the best interests of the patient is another matter. The best way to evaluate the finding of tubercle bacilli in the urine is to collect data of considerable volume on tuberculous

patients who can be carefully followed over a number of years. Such a collection of material was begun in our institution in 1929, and the results of a ten year study are presented in this report. During the period 287 patients with clinically active pulmonary tuberculosis and 112 patients without evidence of pulmonary tuberculosis, or with pulmonary lesions considered to be of no clinical significance, have been investigated. In this series six hundred and thirty-four guinea pig inoculations of sediment from twenty-four hour samples of urine have been done.

RESULTS

Group of Patients with Clinically Active Tuberculosis—In table 1 are given the results of the tests on the group of tuberculous patients.

The 6 patients with minimal pulmonary tuberculosis with tubercle bacilli in the urine had the following renal complications on admission to the hospital: none, 3, convalescent from nephrectomy for tuberculosis, 1, convalescent from epididymectomy for tuberculosis, 1, and tuberculous nephritis, 1. Two patients had nephrectomy after admission to the hospital. Two of the three with nephrectomy had tubercle bacilli in the urine 1 to 5 years after the operation. To date the 3 patients who were not operated on have no clinical evidence of progressive renal tuberculosis.

Of the 6 patients with moderately advanced tuberculosis and with tubercle bacilli in the urine, only 1 has had an associated condition of tuberculosis of the kidney on admission to the hospital. This patient was not operated on and died two months after hospitalization from generalized miliary tuberculosis. One

|                     |       | Positive               | Negative |                 | Positive               | Negative | Positive | Negative |
| Moderately advanced | 5     | 4                      | 3        | 3.1             | 11                     | 3.0      | 11       | 2.0      |
| Far advanced        | 19    | 1                      | 18       | 1.9             | 4                      | 10.5     | 1        | 10.5     |
| Total               | 76    | 5                      | 71       | 4.0             | 15                     | 4.5      | 12       | 4.5      |

patient had an epididymectomy for tuberculosis and later a nephrectomy. Three years after the nephrectomy tubercle bacilli were still present in the urine although there were no clinical manifestations referable to the genitourinary tract. In 4 cases no symptoms or clinical evidence of genitourinary tuberculosis have been present at any time during the period of study.

Of the 11 tuberculous deaths in the group of patients with moderately advanced disease only 1 showed tubercle bacilli in the urine. This patient showed bilateral advanced renal tuberculosis at autopsy. Postmortem examination in 4 other cases gave no macroscopic or microscopic evidence of renal tuberculosis.

Of the 7 patients with far advanced pulmonary tuberculosis and with tubercle bacilli in the urine, 1 was diagnosed as having a complicating renal tuberculosis unilateral, on admission to the hospital. This patient died two months after admission. Necropsy showed bilateral pulmonary tuberculosis. One kidney showed extensive destruction—a typical "surgical" tuberculous kidney. The other, on thorough examination, showed two small tuberculous cavities, a number of microscopic tuberculous foci and several areas of scar tissue. Two more of the 7 have died from pulmonary tuberculosis without having had any symptomatology referable to

small tuberculous lesions in the kidneys and in 1 of them a tuberculous cavity 4 mm in diameter.

Excluding the 5 patients who had a symptomatology referable to a tuberculous infection of the genitourinary tract on admission to the hospital, leaves 14 out of 282 patients with pulmonary tuberculosis who were found to have a tuberculous bacilluria. One of these, with a minimal form of the disease, had symptoms of progressive renal tuberculosis, which developed during hospital residence. A nephrectomy was performed and renal tuberculosis was proved. In the other 13 patients no evidence of a progressive renal tuberculosis has been found, and to date no nephrectomies have been performed. Two have died from pulmonary tuberculosis, 2 are under hospital supervision and 9 have been discharged back to work. One patient in the hospital continues to show tubercle bacilli in the urine, and the other has normal urine. The 9 discharged patients had intermittent bacilluria during hospital residence, 7 of these failed to show tubercle bacilli on the last examination before discharge and 2 had a bacilluria when discharged. A follow-up record of these 9 three to ten years after discharge revealed no deaths and

no development of a symptomatology referable to the genitourinary tract.

#### *Group of Patients Without Pulmonary Tuberculosis*

In addition to the group with pulmonary tuberculosis there was a group of 112 patients whose urines were examined for tubercle bacilli. There were 101 with 112 specimens examined whose urine contained no bacilli. Eleven cases of bacilluria were observed. Seven patients had entered the hospital with a diagnosis of renal tuberculosis, 3 having had a nephrectomy prior to admission to our institution. Of the 4 whose conditions were discovered during residence 1 underwent a nephrectomy and renal tuberculosis was proved. There were 47 persons who showed tuberculous lesions by roentgen ray that were not considered clinically significant. Three of these showed a tuberculous bacilluria and 1 had been subjected to a nephrectomy. Sixty-five patients had normal roentgenograms of the chest, and 8 of these had tubercle bacilli in the urine. Three of the latter have had a nephrectomy with renal tuberculosis proved, 3 had evidence of a bilateral renal tuberculosis and 2 had no symptomatology suggestive of a renal disease. In this group of 112 cases 8 deaths have occurred during the period of study. Not one of the deaths was due to a tuberculous infection.

TABLE 3—*Results of Tests in Five Cases of Tuberculous Bacilluria (Shown in Table 2)*

the genitourinary tract. No necropsies were done. The remaining 4 patients are still alive and have had no clinical symptoms referable to genitourinary tuberculosis.

In the group of patients with far advanced stages of the disease, 22 have died from pulmonary tuberculosis. Nineteen of these failed to show tuberculous bacilluria on thirty examinations. Necropsy was performed in 8 of the 19 cases, in 2 of the 8 there were

*Group of Patients with Six Consecutive Monthly Tests of Twenty-Four Hour Urine for Tubercle Bacilli*—The two groups so far presented had had random testing of twenty-four hour specimens of urine for tubercle bacilli. To complete our study it was decided to examine a twenty-four hour specimen of urine once a month for six months of all patients with moderately and far advanced stages of pulmonary tuberculosis in the institution. The purpose of this part of the study was to determine the incidence and frequency of tuberculous bacilluria. Seventy-six patients—19 with far and 57 with moderately advanced pulmonary tuberculosis—were available, and four hundred and forty tests were done. The urinary sediment was concentrated, and culture and guinea pig inoculation were done with each concentrate. The results of this study are presented in table 2.

Of the 5 patients with tuberculous bacilluria 1 had had a nephrectomy two years previously, 1 had recovered from a tuberculous epididymitis ten years previously, 1 had tuberculous epididymitis during the study and the other 2 had no symptomatology referable to the genitourinary tract. A total of four hundred and nine guinea pig inoculations and cultures was made in the 71 negative cases.

In table 3 the results of guinea pig inoculation and culture in the 5 cases of tuberculous bacilluria are given.

Patient C A had no symptomatology referable to the genitourinary tract but did have moderately advanced pulmonary tuberculosis and extensively involved tuberculosis of the knee. At necropsy both kidneys showed a few small tuberculous lesions and a tuberculous cavity 2 mm in diameter was found. In table 3 it is to be noted that tubercle bacilli were demonstrated in but one of six samples.

Patient B F had an orchiectomy for tuberculosis in 1935, which completely healed in six months. Five examinations of the urine in 1936 and 1937 showed tubercle bacilli, although there were no clinical symptoms referable to the genitourinary tract. A nephrectomy for tuberculosis was done in 1937. After this there were no genitourinary symptoms. In 1938 two tests of the urine showed tubercle bacilli and one did not. Of five consecutive monthly examinations of the urine in 1939 four showed tubercle bacilli.

Patient C P had far advanced pulmonary tuberculosis with tuberculous lesions of the spine and in numerous joints. In 1928 a tuberculous epididymitis developed, which ruptured and at the end of one year was clinically healed. In 1932 tubercle bacilli were found in the urine. Since 1929 there have been no clinical symptoms referable to the genitourinary tract. From March to October 1939 seven specimens of urine were examined, all of which showed tubercle bacilli by guinea pig inoculation or by culture.

Patient J P had an epididymitis, probably tuberculous, which developed during the period of study. The urine showed tubercle bacilli for four months before the epididymitis was clinically evident. The epididymal condition cleared up promptly. The last four specimens of urine examined were negative for tubercle bacilli.

Patient M H, with one out of five consecutive monthly urine examinations revealing tubercle bacilli, never had any symptoms referable to the urinary tract. Artificial pneumothorax was administered from 1934 to 1936. During this period six guinea pigs inoculated with urinary sediment showed no evidence of tuberculosis.

#### COMMENT

Until fairly recent times, surgical intervention in cases in which tubercle bacilli had been demonstrated in the urine was considered imperative. A broader study of the problem revealed the fact that bilateral

renal tuberculosis was not an uncommon occurrence. This led to a more meticulous study of each case, with limitation of operative procedure to the case in which there was only unilateral disease or in which one kidney was much more extensively damaged than the other. A further widening of the field, by examining the urine of tuberculous patients without symptoms referable to the genitourinary tract, led to the discovery of a certain number of instances in which tubercle bacilli were present intermittently in the urine.

In table 4 are presented data, reported in the literature available to the authors, on the occurrence of tubercle bacilli in the urine in cases of pulmonary tuberculosis in which there was no clinical evidence of genitourinary tuberculosis. This does not mean that the urine was entirely normal. A few leukocytes or erythrocytes might be found in urinary sediment, but not one of the classic symptoms of so-called "surgical renal tuberculosis" was present.

The data given in this table reveal a considerable difference in the percentage of positive urinary findings in cases of pulmonary tuberculosis without genitourinary symptoms, but even with the variations shown it is apparent that, with random sampling, in only a minority of cases of pulmonary tuberculosis are there tubercle bacilli in the urine.

Deist, one of the most ardent exponents of Coln-heim's theory of "excretion without lesion," has resorted to the examination of the total excretion of urine for twenty-five days in 90 cases of pulmonary tuberculosis. In this group there were no cases in which there was any clinical evidence of genitourinary tuberculosis. Tubercle bacilli were present in the urine, intermittently, in 35 (38.8 per cent) of the cases. This is the most comprehensive search for tubercle bacilli in the urine recorded in the literature. The fact must be accepted that tubercle bacilli do occur often in the urine of cases of pulmonary tuberculosis without clinical evidence suggestive of genitourinary tuberculosis. But even such a careful study failed to reveal tuberculous bacilluria in about two thirds of the cases. Deist's findings can be accepted, but his reasoning as to the significance of these findings is open to serious question. In his report negative postmortem findings in the kidneys were cited in 5 cases in which tests had revealed tubercle bacilli during life. It is unfortunate that Deist did not make serial sections of both kidneys as did Band. With the diametrically opposite findings reported by these two authors, credence accrues to Band rather than to Deist. The previous reports of Medlar and Sasano and of Medlar agree with Band. We know that tuberculous lesions can be present in the kidneys without corroborative clinical evidence and that in such cases tubercle bacilli can occur intermittently in the urine. One of the cases in our series represents such an instance, clinical evidence of tuberculosis being present in the lungs and the knee joint only. Of seven consecutive monthly examinations of urine only one specimen showed tubercle bacilli. Necropsy revealed several small tuberculous lesions in each kidney.

That more cases of tuberculous bacilluria may be discovered by more frequent examinations is revealed by our group of 76 cases in which monthly examinations were made over a period of six months. Three of the 5 cases in which tubercle bacilli were found might have been missed had a more random sampling

been resorted to. We believe that a few more cases might have been found had we adopted the technic used by Deist.

Harris has reported an incidence of 29 per cent of tuberculous bacilluria in a group of 110 patients with tuberculosis of the bone or joint. In our series there were 3 patients with tuberculosis of the bone or joint, and tubercle bacilli were present in the urine intermittently in each case. These findings suggest that renal tuberculosis is a common occurrence where hematogenous dissemination of bacilli as evidenced by bone or joint involvement, takes place.

In the data presented no tabulation of urinary findings other than those relative to the tubercle bacillus has been given. On all specimens microscopic examination of urinary sediments has been made. The reason for the examination for tubercle bacilli in the 112 cases in the nontuberculosis service of the hospital was that leukocytes or erythrocytes, or both, had been observed in urinary sediments. Of the four hundred and forty urines recorded in table 2, 19.5 per cent showed leukocytes in the sediment, 2 per cent showed erythrocytes, 1.6 per cent had a significant amount of albumin and 3.4 per cent contained tubercle bacilli. Only 1 patient of our entire series had any gross evidence of hematuria or pyuria, and this was one who showed extensive bilateral renal tuberculosis at necropsy. In this group no tubercle bacilli were found when leukocytes were absent from the sediment. On the other hand the presence of leukocytes, erythrocytes or albumin was not necessarily indicative of the presence of tubercle bacilli. It is our experience that it is a wise procedure to test for tubercle bacilli in urine which consistently shows leukocytes or erythrocytes or both, whether such findings are in tuberculous or nontuberculous patients. Such tests will in large part give negative results, but on occasion a positive finding will be obtained in an unexpected situation. Four of the 11 patients with renal tuberculosis in the nontuberculosis service were thus discovered.

In the group of 33 patients with tuberculous bacilluria 8 had had a nephrectomy and tuberculosis was proved. There have been no deaths in the group with nephrectomy. Of these 8, 4 were considered as having "clinically inactive" pulmonary tuberculosis and 3 had minimal and 1 moderately advanced "clinically active" disease. Of the remaining 25 patients who had no nephrectomy, 3 with far advanced and 2 with moderately advanced pulmonary disease have died. Three patients were examined post mortem, 2 showed extensive bilateral renal tuberculosis, and 1 had miliary tubercles in both kidneys. Of the 20 now alive 18 have shown no symptoms suggestive of progressive renal tuberculosis. Two have genitourinary symptoms, and both of these have clinical evidence of a bilateral renal tuberculosis.

Sixteen of the 33 patients with tubercle bacilli in the urine presented clinical symptoms referable to the genitourinary tract. This condition was discovered in 17 persons when urine tests were done because leukocytes or erythrocytes, or both, were present in the sediment. In only 1 of these was nephrectomy done, tuberculosis of the kidney being proved. To date in none of the 16 without nephrectomy, discovered in routine urine tests, has any evidence of progressive renal tuberculosis occurred and the majority of the patients had normal urine on discharge from the hos-

pital. The question which this situation raises is the significance of the casual finding of tubercle bacilli in the urine. At present it does not seem to indicate surgical intervention, for more than half of the patients have shown no evidence of progressive renal tuberculosis five to ten years after the bacilli were observed in the urine. The others have not been observed long enough to warrant any conclusions.

The adherents to Cohnheim's theory of "excretion without lesion" may choose to call these cases instances of excretory bacilluria, but here the point of view will be very largely governed by the individual's concept of the pathologic changes of renal tuberculosis. If it is assumed that every tuberculous infection of the kidney progresses to destruction of that organ, then there is no alternative to accepting Cohnheim's concept. If, however, any credence is given to the possibility and the probability that small tuberculous lesions in the kidney may completely heal in the same manner that they do in other body tissues, then evidence is at hand that small tuberculous lesions may ulcerate, discharge bacilli into the urine and later heal without at any time presenting clinical evidence that such a process has occurred. To present scientific proof that will completely refute the idea that a normal kidney can excrete tubercle bacilli from the blood as a part of its normal physiologic function is impossible, especially in the human being. While Medlar and others have reported the finding of scars representative of healed infectious lesions in kidneys with and without tuberculous foci in cases of tuberculosis, there is no possibility of proving that these scars represent the healed stage of tuberculous lesions. Unfortunately, cicatrices as such are not pathognomonic of a specific infection. Logic, supported by data from animal experiments may aid in the clarification of this problem, but the deductions made will depend on the premise that small tuberculous foci in the kidney can completely heal or that they will never retrogress. From the experience of the authors, the concept that small tuberculous lesions do completely heal in the kidney, as well as in other body tissues, is tenable. And on this premise our belief is based that the patients showing tubercle bacilli in the urine in the absence of other lesions of the urogenital tract and without clinical evidence of renal involvement present tuberculosis of the kidney.

In the male, tuberculous epididymitis may complicate the diagnosis of renal tuberculosis. In our series there have been 3 cases of this kind. In 1 case the tuberculous epididymitis had occurred twelve years previously and had completely healed. There had been no symptoms referable to the genitourinary tract since that time. At present tubercle bacilli are consistently evident in the urine. In the second case an epididymectomy for tuberculosis had been performed prior to hospital admission. The urine continued to show tubercle bacilli, although the operation for tuberculous epididymitis was successful. Careful studies revealed a renal tuberculosis, and nephrectomy showed an old tuberculous cavity. Three years after the nephrectomy tubercle bacilli were still present in the urine, and there was evidence that the remaining kidney was involved. The third case was of particular interest, as tubercle bacilli were demonstrated in the urine four months prior to a mild epididymitis, which subsided without surgical intervention. These 3 cases give credence to the statement of Young that "infection of the epididymis takes place in tuberculosis

as in gonorrhea, by means of the cold and not by the blood stream. That cases of hematogenous infection occur cannot be denied, but they are few in number."

Tubercle bacilli were found in the urine of patients with clinically active pulmonary tuberculosis in all stages. There were 17 patients without symptoms referable to the genitourinary tract, 3 had minimal, 6 moderately advanced and 8 far advanced pulmonary disease. Patients with tubercle bacilli in the urine and without genitourinary symptoms represented 8.5 per cent of the minimal, 3.6 per cent of the moderately advanced and 9.8 per cent of the far advanced group. The minimal group was composed of 35 persons, and it is likely that an examination of a much larger group might lower the incidence. As to patients with moderately advanced (163) and far advanced (82) pulmonary tuberculosis, tubercle bacilli were found in the urine at least twice as frequently in the latter group.

The significance of tubercle bacilli in the urine will remain controversial as long as there are any adherents to the concept that the kidney can excrete bacteria from the blood stream as a part of its physiologic function and that tuberculous lesions of the kidney never heal. No one, however, can refute the fact that tubercle bacilli occur in the urine of persons who have presented no clinical symptoms referable to the genitourinary tract at the time of, or over a long period subsequent to, the finding of the bacilli. Regardless of the interpretation one may choose to make of tuberculous bacilluria, one fact is very evident: this finding is no longer so ominous that surgical intervention need be promptly instituted. In certain instances nephrectomy for tuberculosis may be necessary, but before proceeding to major surgical intervention every patient with tubercle bacilli in the urine deserves exhaustive study. The patient who has access to the services of those who are cognizant of the protean nature (clinically and pathologically) of the disease tuberculosis will obtain the care best suited to his condition.

#### SUMMARY

Data were accumulated over a ten year period on the presence of tubercle bacilli in the urine of clinically tuberculous and nontuberculous patients. A total of 1,074 (634 random and 440 consecutive monthly) guinea pig inoculations of sediments from twenty-four hour specimens of urine has been done on 287 tuberculous patients and on 112 patients from the nontuberculosis service of the hospital.

Of the tuberculous patients, 22 (7.7 per cent) showed tubercle bacilli in the urine. Of these, 17 (77 per cent) had no clinical symptoms suggestive of renal tuberculosis.

Leukocytes and erythrocytes in urinary sediment need not indicate the presence of tubercle bacilli. It is, however, a wise procedure to test for the presence of tubercle bacilli in cases in which leukocytes and erythrocytes are consistently present.

The presence of tubercle bacilli in the urine does not indicate that progressive renal tuberculosis will inevitably follow. Surgical intervention should therefore be delayed until such time as progressive renal destruction has been proved.

Tubercle bacilli are not commonly found in the urine even in cases of far advanced pulmonary tuberculosis and may be demonstrated repeatedly in some cases in which tuberculous infection has not been suspected.

## EPIDEMIC CONJUNCTIVITIS OF PRESUMED VIRUS CAUSATION

REPORT OF AN ESTIMATED SIX HUNDRED CASES IN ONE SHIPYARD

FORREST E. RIEKE, M.D.

PORTLAND, ORE

During late October 1941 an epidemic of ocular inflammation appeared in the Oregon Shipbuilding Corporation yards. In the next six weeks I saw about 500 men with this condition. Although the men put the blame for their trouble on their working conditions, no matter where they were working in the yards, it was evident from the rapid spread, the similarity of the inflamed eyes and the uniform resistance to any treatment that I was dealing with the same process in all the men. The disease was more prevalent in men actively engaged in building the ships, but it was also found in the office workers, families of the workmen and several physicians in the Portland area.

At the time of the first appearance of this inflammation in the Portland yard the overall payroll was thousands of men, of which many were in ship construction work. A small percentage of the men exposed were affected in the ensuing few weeks. The rapid spread was startling. Within a week the incidence went from a few cases to nearly 200. Because medical work here normally involves treatment of several hundred cases of minor ocular difficulties each day, the idea was advanced that poor technique was assisting spread in the plant, but direct questioning of the new patients revealed that more than half had not been in the first aid hospital at any time closely preceding onset of their inflammation. None of the regular medical attendants became infected. One medical student employed for one day a week acquired the disease and, under care, was well in twelve days.

Repeated bacterial studies of smears and cultures by Portland ophthalmologists did not establish the cause, therefore it was assumed that it was a virus infection. No medication was found which would alter the course of the inflammation.

The editorial in THE JOURNAL on epidemic virus conjunctivitis<sup>1</sup> contained the only reference to the origins of this epidemic which I have been able to discover.

W. J. Holmes<sup>2</sup> reported an epidemic of infectious conjunctivitis which passed through the Territory of Hawaii in the summer of 1941. His clinical descriptions closely fit the disease as I saw it manifested here. Of interest was his statement that those who were infected in Hawaii were inclined to attribute their disease to foreign material lodging in or touching the eye, those working in canneries attributing it to getting pineapple juice in the affected eye, those doing much swimming to swimming in contaminated water, and so on. This was a common experience in the shipyard, the majority of the men alleging on presenting themselves for care that something was in the eye and that it was material with which they were working, be it dust, sawdust, steel, lime, red lead, fountain pen ink or oil vapors.

The disease usually involved only one eye, although in some of our men the other eye displayed redness never as severe as in the primarily affected eye.

<sup>1</sup> Epidemic Virus Conjunctivitis, editorial J. A. M. A. 114 (Feb. 7) 1942.  
<sup>2</sup> Holmes, W. J. Epidemic Infectious Conjunctivitis. Hawaii Med. J. 1: 11 (Nov.) 1941.

the typical case the eye was very red and swollen. The conjunctiva was widely involved with chemosis and extensive injection, of conjunctival, ciliary and episcleral types. Small hemorrhages about the bulbar vessels were common. The conjunctiva of the fornices in many bulged from beneath the lids. The lower lid was lined by a thick, velvety, reddened conjunctiva, which in some after ten to twelve days would desquamate heavily. The lining of the upper lid was much less severely inflamed and characteristically displayed small red spots, most apparent near the edge of the lids. Grossly, the cornea appeared uninvolved. The eye teared continuously with a straw colored to brown watery discharge, not purulent. The eyelids would be stuck together each morning. The eye was not painful, but the workman complained of a sticking or scratching sensation, as though an eyelash was scratching the eyeball. There was some photophobia but only of mild degree. Most inflammations lasted from sixteen to twenty-eight days, none for less than twelve. Of the cases which I observed in about 50 after twelve to fourteen days grossly visible speckling developed in the substance of the cornea, grayish condensations 0.5 mm in diameter, a few millimeters apart, and in such number as to reduce definitely the vision of the involved eye. The cornea did not lose its normal sheen, and there appeared little tendency to steaminess. Vascularization of these gray spots did not occur. Most of this group after two months showed little or no change in the speckling or visual acuity. In those whom I have had opportunity to see regularly for the past seven months, it is now evident that the number, size and density of the dots in the cornea are diminishing slowly and presumably will gradually disappear, at least to examination with the naked eye. Whether these scars will permanently alter vision of the involved eye I am unprepared to state. In practically no case was corneal ulcer a direct concomitant.

In general, I found that the process was most severe in early November, roughly paralleling its period of most rapid spread. It was less severe as the weeks advanced, and after December 15 I encountered no new cases until the middle of January, when a new wave of infection produced about 50 cases. These were mild conditions which disappeared within six to eight days after inception.

I then saw little of this ocular condition except in a few cases of doubtful relationship until early May, when more cases of typical appearance and behavior became manifest. The disease in these has been more severe than in those of January, in most cases lasting from eight to twelve days, but in only 1 has corneal speckling developed with diminished vision. The condition in this case, however, has not approached at all the degree of visual interference achieved in those observed in November and December.

It is safe to say that every known therapeutic agent for the treatment of ocular infections was used in some of these cases in Portland during November and December 1941, with a uniform lack of good results. In watching the whole group of cases as treated by myself in the shipyard and in the offices by the practicing ophthalmologists, it seemed that the workman was best cared for if he left the job, used a mild eye wash, avoided eyestrain and observed ordinary cleanliness and hygiene of the eyes. Any further medication or therapy seemed entirely noncontributory to cure.

## COMMENT

During the past eleven months I have seen many thousand men with arc flash, eye injuries, infections of the eyes and lids, burns about the eyes, and other disorders, all the pathologic ocular conditions to be found among steel workers, most of whom are inexperienced. The inference has been drawn that shipyard workers are particularly susceptible to this infection through some assumed peculiarity of their work. I have seen little proof offered to substantiate this theory and feel that it is untenable. A large number of my patients were unable to link the infection with known ocular foreign bodies, and the exact source of the infection was in nearly all cases not demonstrable. It should be reiterated that the disease attacked various elements in the population and is known to have been geographically distributed from Hawaii to Portland, Ore., to San Francisco to New York and way points. The usual factors influencing an epidemic would appear to have been active, namely, heavy concentration of men from all stations of life (farm and city), poor ocular hygiene and a newly introduced agent of rather remarkable virulence and contagiousness.

It is cogent that, of the persons exposed to a highly contagious organism, the number developing a clinically recognizable infection reached only a small percentage in several new outbreaks of the disease. Also notable was the rather spotty extension of infection to the workmen's families, the percentage incidence roughly paralleling that among the men.

## SUMMARY

An infection of the eyes of unknown causation was seen in the Oregon Shipbuilding Corporation yard at Portland, Ore., in November and December 1941. It was an acute conjunctivitis which (1) involved a small percentage of exposed men, (2) was contagious, (3) was unidentifiable as to cause by ordinary culture methods, (4) came apparently from Hawaii, (5) extensively inflamed only one eye, (6) left corneal scars in from 1 to 10 per cent of the patients, (7) was self limited and irresponsive to treatment, (8) spread rapidly over the United States, (9) remains locally endemic with sporadic increases and (10) is assumed to be due to a virus.

---

**Appropriate and Satisfactory Recreation**—The advent of war has suddenly thrown on the people of the United States a responsibility for greatly increased work. Leisure time some of it in the enforced leisure of unemployment has vastly diminished. The planning of appropriate and satisfactory recreation seems all the more necessary at this moment. If we must have play to complete our lives and if the time in which we may play is reduced, it is obvious that we must learn and plan to play better while we are playing. It was wise of those counselors on civilian morale to include among the earliest exhortations which they addressed to the American public the advice that we should work as hard as we can but hold on to our hobbies. For such advice is, in the light of psychiatric experience, sound and sensible. If the proper direction and encouragement of play can be therapeutically useful it can also be prophylactically useful. If it is good for sick people it is even better for well people. We are all subject and liable to the disease of disturbed morale—demoralization—and one of the best antidotes against this is to be found in recreation—Menninger, Karl, and Menninger, Jeanetta Lyle *Recreation for Morale Bull Menninger Clin* 6:97 (May) 1942.

## Clinical Notes, Suggestions and New Instruments

### INTRABRONCHIAL METASTASIS OF HYPERNEPHROMA SIMULATING PRIMARY BRONCHIAL CARCINOMA

C. D. NOFSINGER, M.D., ROANOKE, VA., AND  
PORTER P. VINSON, M.D., RICHMOND, VA.

There is seldom any difficulty in distinguishing malignant lesions that arise primarily in the lung from those which are borne by the blood and lymphatic vessels from a distant source to the pulmonary tissues and develop as secondary or metastatic growths.

In the majority of cases roentgenoscopic appearance is characteristic of a metastatic pulmonary malignant lesion, and even though metastatic nodules may be numerous and large they seldom produce physical signs or symptoms of pulmonary disease unless the pleura is invaded. When metastatic lesions involve the pleura, effusion may develop in sufficient amount to produce dyspnea and physical signs of pleural thickening or hydrothorax. In addition to lack of physical signs and symptoms of pulmonary disease in metastatic pulmonary lesions, a primary malignant tumor is usually readily detectable in some other portion of the body.

In contrast to metastatic pulmonary malignant lesions, a primary malignant lesion in the lung usually arises in one of the larger bronchi and produces characteristic physical signs and symptoms even when the tumor is small. Primary pulmonary malignant lesions usually produce obstruction to a bronchus with atelectasis of that portion of the lung supplied by the affected bronchus. On roentgenoscopic study a unilateral area of density, more or less triangular, radiates from the hilar region with the base of the triangle directed toward the periphery of the lung. Secondary deposits from the primary tumor are seldom observed in other portions of the affected or opposite lung. Other confirmatory evidence that the tumor is primarily from a bronchus is the absence of another tumor elsewhere in the body.

Fig 1—Section of tissue removed from bronchial lumen, showing typical appearance of adenocarcinoma of kidney (hypernephroma).

Adenocarcinoma of the kidney, or so-called hypernephroma, however, is one type of tumor that may be associated with secondary deposits in the lumen of a bronchus, producing physical signs and symptoms identical with those caused by a primary bronchial growth. Several occurrences of this kind

have been reported previously, but in all instances the primary renal tumor had been diagnosed prior to identification of the intrabronchial metastatic lesion. In the case we are reporting the primary renal growth was symptomless and was unidentified until after bronchoscopic examination, when tissue, removed from the bronchus for microscopic study, revealed hypernephroma.

#### REPORT OF CASE

A man aged 69 had been well until February 1941, when a respiratory infection developed that was diagnosed influenza. He was not particularly ill, but he felt bad for about a week

and was then fairly comfortable for two weeks. At that time he began to have a cough productive of purulent sputum and wheezing that seemed to be located on the right side of the thorax. At first he lost a little weight and thought he had slight elevation in temperature. He did not note thoracic pain, dyspnea or expectoration of blood. Roentgenoscopic examination revealed infiltration in the hilar area of the right lung with discrete nodules at the base and periphery of the right lung.

Fig 2—Appearance of chest of patient revealing infiltration in right hilar area with discrete metastatic shadows at periphery and base of right lung (note difference in aeration of right and left lung).

When the patient was examined on October 20 he looked and felt well and had regained the weight that had been lost during the early part of his illness. Examination of the blood disclosed a hemoglobin content of 90 per cent, erythrocytes numbering 4,300,000 and leukocytes 7,450. Urinalysis showed an acid reaction, a specific gravity of 1.017, albumin 0, sugar 0, acetone 0, and microscopically an occasional pus cell. The significant findings on physical examination were the presence of wheezes and definite diminution of breath sounds over the lower lobe of the right lung.

Bronchoscopic examination on October 20 revealed an ulcerating, pedunculated tumor in the bronchus to the lower lobe of the right lung. Large pieces of the tumor were removed for study. Microscopic examination of the tissue was uninformative in that the major part of the tumor was composed of necrotic material of ill defined, degenerating cells. The patient went home before microscopic examination of the tissue was completed, but he was advised to have a second bronchoscopic study because of the possibility of the tumor's being benign.

When he was examined on November 12 he felt well and had gained 3 pounds (1.36 Kg). Wheezing had disappeared and cough had diminished. On examination of the thorax breath sounds were reduced over the lower lobe of the right lung although more audible than at the previous examination. Bronchoscopic examination disclosed the same type of tumor that had been observed at the previous examination. Large pieces of tissue were again removed for examination, and microscopic study revealed the characteristic appearance of adenocarcinoma of the kidney (fig 1).

After the true nature of the tumor had been determined, palpation of the renal areas revealed a mass in the right kidney, apparently twice the size of a normal kidney.

Intravenous urography showed a normal outline of the left kidney and the right kidney rather poorly filled with the injected material. Three months later the patient continued in good health without symptoms referable to the urinary tract. There had been an increase in the tumor revealed in the roentgenogram (fig. 2).

## Special Article

### HANDBOOK OF NUTRITION I

#### INTRODUCTION

JAMES S. McLESTER, M.D.

BIRMINGHAM, ALA.

*The following article by Dr. James S. Mc Lester, Chairman of the Council on Foods and Nutrition of the American Medical Association and member of the Food and Nutrition Board of the National Research Council is the first of a series of articles on foods and nutrition prepared under the auspices of the Council on Foods and Nutrition. These articles will be published later as a Handbook of Nutrition—Ed.*

The most fertile field in the world of medical research today is nutrition. The yield is good and even in time of war the product compares favorably in value with that of the industries. To weigh these values critically, to correlate them, to examine them in their relation to medical practice and human welfare, and then in the light of the information thus gained to revise present day knowledge is the object of a forthcoming series of special articles on nutrition.

The advances which have been made in the science of nutrition within the past few years fire the imagination. Vitamins have been produced in pure form and their functions defined with a fair degree of clearness, and as a result a more intimate knowledge has been gained of the intricacies of metabolism, the essential nature of fats has been demonstrated, the roles of proteins and minerals in human economy have been further elucidated, the amounts in which all these necessary substances are required by man have been expressed in figures, and the foods which provide them most abundantly have been determined. Finally, there has developed a clearer understanding of the deficiency states with a fuller appreciation of the frequency with which these states impair man's usefulness and destroy his happiness. This marks an era of signal achievement.

Such discoveries, however, seldom tell the whole story. They clarify problems and give useful information, but not infrequently their most significant result is to increase the scope of the student's vision and to open up new vistas for further exploration. Constantly new problems present themselves. Consider for example, the relationship of vitamins to enzymes. Some are co-enzymes and are known to unfold their specific activities while serving as the prosthetic group of the enzyme molecule. Is all vitamin activity of this nature? Witness too the need for more complete data concerning man's requirement for the vitamins of the B complex, notably riboflavin and nicotinic acid and also for further information concerning the full function of ascorbic acid, one of the most thoroughly studied of the vitamins. How pressing is the need of the adult for

vitamin D? Do the requirements for all vitamins, as is true of some vary with circumstances? And what are the circumstances? To what extent does each of the known vitamins influence the requirement for the others? Is there such a thing as an optimum ratio between vitamins, and what is the result when this ratio is grossly upset? Will the administration of one vitamin precipitate symptoms due to the latent deficiency of another? In truth, the story of the vitamins is just beginning.

The same is true of the mineral elements. It would be of advantage to know, for example, more about the influence of the various life periods on human requirements for calcium and phosphorus and about the influence of the other inorganic elements on the availability of copper and iron. Of clinical interest too are the hazards to which the latter element is subjected in its absorption from the intestinal tract. One of the newest problems deals with the role played by the so-called trace elements in animal metabolism. There are indications that it is not an unimportant role.

Then come even more practical questions. After ages of experience in gathering, storing and cooking food, man is now beginning to inquire concerning the effect of all this on nutritive values. Only today he has learned that vegetables improperly gathered and permitted to remain hours upon hours on display at the grocer's lose much of their nutritive value and that the bottle of milk left on his doorstep in the bright sunlight will within the hour be deprived of a large part of its riboflavin. Even the effect of cooking on the digestibility and availability of the various proteins is not fully understood. Insistent questions too are being asked by nutritionists as to the effect on foods of storing, drying, freezing, sterilizing, pasteurizing and milling. Indeed, the influence of all forms of processing is under investigation.

Technical procedures suitable for clinical use are needed. The recognition of nutritive deficiency is often difficult because of the paucity of precise methods by which a person's nutritive status in respect to each of the known vitamins can be measured. The dark adaptation test for vitamin A deficiency and the slit lamp method for revealing the small vessels in the cornea, which tell of riboflavin deficiency, are of promise, but the pressing need is for special techniques by which biochemical changes can be measured. By such methods it is possible today to recognize in the blood a deficit in proteins, ascorbic acid or vitamin K, but the other techniques which have been developed are not available for clinical use. Then too there are more fundamental difficulties. One of these lies in the fact that figures obtained from the blood do not necessarily tell of the adequacy with which the body is equipped with a given substance. The amount of a vitamin held in the blood may not begin to fall until the stores of that substance in the tissues are almost exhausted and it is the state of the tissues that really tells the story. In addition there is a need for more dependable standards. It is a mistake to assume that the so-called normal subject, chosen because of his healthy appearance is necessarily normal in respect to his vitamin equipment. Standards should be obtained, not from the general population, but preferably from groups of persons whose intakes of all nutrients for a definite period are known to have

approached the optimum and, when feasible, these standards should also refer to age and occupation groups. Until the special technics are of wider availability and standards are more dependable the physician must continue to depend largely on his clinical acumen.

Research in nutrition has not been limited to the study of single essentials. Food products are being investigated in the effort to point out those articles which are especially rich in essential substances and those which have good supplementary values. The effort is being made also to improve the quality of cheap staple foods, as is seen in the development of enriched flour, in the fortification of oleomargarine with fish liver oils and in the addition of iodine to table salt. Such restoration of important substances lost in processing, as in the case of enriched flour, is being encouraged, but it should be noted that, with two exceptions (the addition of vitamin D to milk and vitamin A to butter substitutes), the Council on Foods and Nutrition of the American Medical Association does not approve of the addition to foods of substances not found in the native article or in amounts in excess of the amount carried by the best foods of its class. The attempt to convert a food into a pharmaceutical product is frowned on, but the restoration of substances lost in preparing the food for the market is a recognized part of the nutrition program.

The government also is interested in nutrition, vitally so in these perilous times of war. To wage successful war a nation must possess not only armed forces of surpassing valor, well equipped, but also, supporting these, a people of inflexible stamina. This last demands that the population be well fed. If their food is lacking in kind or amount they will be wanting in industrial efficiency and nervously unstable. To produce the food required, to get it to the people and then to induce them to use proper selection in its eating are problems of agriculture, transportation, commerce and education, all of which in turn are problems of government. The state is becoming acutely aware of its obligations in this regard, as was evidenced in the calling by the President of the nutritional conference for defense, in the formation of the Food and Nutrition Board of the National Research Council, in the activities in this field of the Federal Security Agency, and in the increased interest shown by the Food and Drug Administration in accuracy in labeling and truthfulness in advertising. Through these agencies, measures are being developed for the protection and education of the consumer, and increasing governmental regulation of the production, processing, storage and sale of food may be expected. If this is wisely done, benefits will accrue.

But, it is asked, is all of this in truth as important as would appear? Is the average American diet susceptible of great improvement? I would unhesitatingly answer yes. If some physicians answer no, it is perhaps because they are not looking at the whole picture. True, outspoken deficiency diseases are relatively rare in American hospitals—at least they seldom stare one in the face—but this is not the type of deficiency of which I write. The type which in point of numbers bulks largest is the milder type, often expressed by borderline states of nutritive failure in which the person is neither grievously sick nor entirely well. Scrutiny of the life histories of patients and studies of their personality have

shown that the earliest effects of nutritive deficiency are not to be found in the polyneuritis of beriberi or in the bleeding gums of scurvy or in the dermatitis of pellagra but rather in the mental depression, nervous instability and other forms of vague ill health which almost always come first. Indeed, the severer, more outspoken manifestations may remain indefinitely in abeyance, the patient is simply called a neurasthenic, or such terms as inadequate personality and constitutional inferiority are applied. After watching these patients, one is impressed by the truth of the statement that no greater catastrophe comes to man than the loss of efficiency, the lack of initiative and the mental depression which accompany nutritive failure. Evidence that these more elusive forms of nutritive deficiency are not rare but in reality are of frequent occurrence can be found in the other articles of this series and in the recent report of Jolliffe, McLester and Sherman.<sup>1</sup>

The prevention of the disorders just enumerated, however, is not the only object of present day studies in nutrition. A far wider objective is sought—the improvement of the race. This is not beyond reason, take two examples. Consider first the success of feeding experiments with the lower animals. Students of nutrition have been able through intelligent additions to a ration which already was regarded as adequate so to improve the albino rat in respect to stature, vigor, fertility and longevity as to produce in the course of years a superior race of animals. Then compare the children born in this country of immigrant parents with their forebears and note their superiority in physical and mental characteristics. Though not so striking, a similar trend can be seen in children born of American stock. This superiority can be attributed to the better environment enjoyed by these children, an important feature of which has been a more adequate diet. To students of nutrition this points the way to the development of a larger, more vigorous race.

Ever since man's early ancestors first climbed out of the sea and began to forage on land, he has been able through gradually increasing control of his environment steadily to improve the nature of his food. This has been a potent factor in the evolutionary process that has made him dominant as a species and has kept him so for thousands on thousands of years. Biologic history, however, contains numerous examples of evolution of a species which was followed in time by involution. The effort today to adjust human environment to physiologic needs is expected to prevent the latter process but as to its ultimate success genuine doubt may be entertained.

The trend of improvement in man's nutrition continues. In attractiveness, keeping qualities, palatability and digestibility his food today is superior to that of his immediate forebears, but it has also suffered loss. Because of the refinements to which it has been subjected it often fails to carry vitamins, minerals and other essential substances in the abundance supplied by its earlier foods. Is it possible that these disadvantages will in time outweigh the advantages and lead finally, at a halt, even to a retrogression, in the development of the race? And can this be prevented through the aid

<sup>1</sup> Jolliffe, Norman, McLester, J. S. and Sherman, H. C. Prevalence of Malnutrition. J. A. M. A. 118: 944 (March 1942).

cation of the recently gained knowledge of nutrition? Or, still better, is it possible by means of this knowledge to carry forward, even accelerate, man's upward progress? The answer can be sought in the special articles which follow

## Council on Physical Therapy

THE COUNCIL ON PHYSICAL THERAPY HAS AUTHORIZED PUBLICATION  
OF THE FOLLOWING REPORT      HOWARD A. CARTER, Secretary

### SANBORN WATERLESS METABOLISM TESTER ACCEPTABLE

Manufacturer    Sanborn Company, 39 Osborn Street, Cambridge, Mass

The Sanborn Waterless Metabolism Tester, model of 1942, is a compact semiportable unit 17 inches high by 8 inches wide by 12 inches long. It may be used with or without a stand which brings its total height to 46 inches. On this stand it occupies about 3 square feet of floor space and weighs about 50 pounds with equipment. Oxygen tank and auxiliary apparatus are carried on the stand, which is mounted on large casters.

The patient is connected to the machine by rubber tubes 27 inches long. The mouthpiece is amber gum rubber of the intraoral type. Nasal breathing is prevented by an adjustable spring nose clip cushioned with soft sponge rubber. The machine is available with or without the oxygen measuring chamber, which makes it possible to use the short test method as described herewith.

This waterless machine is essentially the same as the 1941 model Sanborn Waterless Metabolism Tester<sup>1</sup>. However, two parts have been changed: first, the patient valve has been shifted from the base of the machine to the end of the tubes at the mouthpiece connection; the valve is a ground fitting, and, second, the motor has been exteriorized together with the blower housing. It is connected to the blower housing by a covered shaft  $\frac{3}{4}$  inch long. This places the motor a total of  $3\frac{1}{2}$  inches above the base but still only  $\frac{3}{4}$  inch from the blower. As before, the motor requires 110 to 120 volt, 60 cycle, alternating current and will not work with direct current. The recording device is the same as that on the preceding machine and carries the same waxed paper chart.

In spite of the changed position of the motor mounting, conduction of heat as recorded by the thermometer on the machine is to the extent of 2 degrees in ten minutes and  $5\frac{1}{2}$  degrees in twenty minutes. When the system is running idle and not connected to the patient a series of tests showed the following:

|        |   |
|--------|---|
| Test 1 | 8.5 minutes—rise of 2 degrees             |
| Test 2 | 6.5 minutes—rise of 2 degrees             |
| Test 3 | 6.0 minutes—rise of $1\frac{1}{2}$ degree |
| Test 4 | 6.5 minutes—rise of 1 degree              |
|        | 27.5 minutes      6.5 degrees             |

These tests were run in rapid succession and represent a total rise of 6.5 degrees in a period of twenty-seven and a half minutes. Twenty minute breathing tests without running the motor in the machine showed a rise of only 1 degree in the thermometer. Tests of the machine thermometer reveal that it gives temperatures 1 degree below actual test-bath temperatures. The Council is of the opinion that these findings indicate a poor correlation between the temperature of the patient's expired air and the temperature as indicated by the thermometer of the machine, and that the motor on the machine exerts a greater influence on the thermometer than does the patient's breathing or the temperature of the air in the bellows.

Circulation of the oxygen in the bellows is aided by means of a motor driven blower which develops a positive water pressure of 2 mm on the patient intake tube. The patient valve mentioned makes it possible for the operator to connect the patient with room air or the oxygen of the bellows at will. When the patient is breathing room air through the mouthpiece the bellows are locked at their immediate position. The air inlets and tubes leading to the bellows are sufficiently large to accommodate regular breathing.

The methods of measurement of actual oxygen consumed in a test area is the same as in the previous model (Sanborn Waterless Metabolism Tester, 1941). Two methods may be used: one, the measurement of time necessary for the patient to consume a definite amount of oxygen, and, two, the measurement of the amount of oxygen consumed in a definite amount of time.

In the first, or shorter, method a definite amount of oxygen, 1.25 liters, is put in the bellows, and the patient breathes from this until that amount of oxygen is consumed. The time for this consumption is noted and the computation is made on that basis. Sufficient excess oxygen remains in the bellows at all times to insure the patient's comfort.

In the second, or long test, method the bellows is filled with a sufficient amount of oxygen for the patient to breathe for a definite length of time, which may be from six to ten or more minutes. The amount of oxygen is then computed from the fall of the bellows. This fall is calibrated in terms of oxygen volume.

Sanborn Waterless Metabolism Tester

Computation of the patient's basal metabolic rate in both test methods may be made by means of a special slide rule furnished with the machine. This rule can be used only after cubic centimeters of oxygen per minute have been determined. In the short test, measurements of the volume per minute may be read directly by means of a special scale found at the top of each sheet of the kymograph paper. This scale is logarithmic and calibrated to read cubic centimeters of oxygen per minute actually consumed by the patient.

In the long test a special T type scale is furnished from which cubic centimeters of actual oxygen consumption may also be read directly. It is calibrated in the same manner as the edge of the chart but is adjustable for corrections in temperature and barometric pressure as they exist when the test is being run.

The accuracy of both the short and the long test depends on the accuracy of the calibrations on the T scale and on the scale at the edge of the chart. These scales are unchanged from the previous model. They were again examined and found to be sufficiently accurate within the limit of experimental error.

The accuracy of the short test method depends on the accuracy with which the oxygen can be measured into the bellows. The oxygen is measured by means of a small compression chamber connected with a gage and designed to hold exactly 1,250 cc of oxygen at 0 centigrade.

Variations in temperature are accounted for in this type test by filling the measuring chamber and its gage to the mark of a movable red hand. Volumetric determinations were made to test the accuracy of this chamber and gage. Proper corrections of these determinations for temperature pressure and vapor pressure showed the contents of the chamber to be consistent on various trials and volumetrically within the limits of error.

Tests for leakage were made both by using the suggested tests in the "Instructions" pamphlet and by multiple twenty-four hour tests in constant temperature. Leakage was not present in the former series and minimal in the latter. These tests included both the patient valve and the breathing tubes of the machine.

The Council voted to include the Sanborn Waterless Metabolism Tester on its list of accepted devices.

## Council on Pharmacy and Chemistry and Council on Foods and Nutrition

AT THE MEETING OF THE COOPERATIVE COMMITTEE ON VITAMINS A COMMITTEE WAS FORMED TO PREPARE A REPORT ON THE USEFULNESS OF VITAMIN MIXTURES. THIS COMMITTEE CONSISTED OF DRs S. W. CLAUSEN, W. W. PALMER AND T. D. SPIES, CHAIRMAN, AND WAS AIDED BY OTHER MEMBERS OF THE COUNCILS. THE FOLLOWING REPORT HAS BEEN AUTHORIZED FOR PUBLICATION BY THE COUNCIL ON PHARMACY AND CHEMISTRY AND THE COUNCIL ON FOODS AND NUTRITION.

AUSTIN E. SMITH, M.D., Acting Secretary,  
COUNCIL ON PHARMACY AND CHEMISTRY

FRANKLIN C. BING, Secretary  
COUNCIL ON FOODS AND NUTRITION

### THE PROPER USE OF VITAMINS IN MIXTURES

Long after beriberi, rickets, scurvy and pellagra were recognized and described by physicians, the concept arose that certain "accessory food substances" are essential for life and health. With the development of this concept, a milestone in medicine was passed. Of late, considerable research has been directed toward the isolation and synthesis of so-called accessory food factors more commonly known as vitamins, and some of these substances have been found effective in the treatment of rickets, scurvy, beriberi and pellagra. The years following the brilliant investigations leading to the isolation and synthesis of riboflavin, thiamine hydrochloride, pyridoxine hydrochloride and pantothenic acid and the recognition of the role of nicotinic acid have seen many patients near death from dietary deficiency diseases restored to health by the proper use of some of these compounds. The administration of nicotinic acid to pellagrins confined to custodial hospitals for the insane may enable them to regain their normal mental state and to return to a satisfactory life in their homes. The giving of thiamine to patients has brought rest and freedom from pain arising from nutritional neuritis so severe that they could not sleep even after taking narcotics. Persons whose eyes hurt so badly through lack of riboflavin that they could not read or endure a lighted room have been relieved by riboflavin. These dramatic therapeutic effects are tending to overshadow the necessity of finding effective methods of prevention.

#### SYMPTOMATOLOGY

It is apparent that prolonged deprivation of vitamins due to a suboptimal intake, failure of absorption and utilization or increased demand produces a variety of diseases. In these diseases the symptoms are seldom well defined and, except for rickets or scurvy, rarely appear uncomplicated. The resulting clinical picture seen by the physician is a complex one, and he frequently recognizes a number of distinct deficiency diseases in the same person. The patient may have disease arising from partial deprivation of vitamin A, vitamin D, nicotinic acid amide, thiamine, riboflavin and ascorbic acid. In these deficiency states the skin, alimentary tract and the nervous, hemopoietic and cardiovascular systems may be involved. Signs and symptoms arising in the skin include atrophy, scaling, erythema, pigmentation, ulceration and cornification. If the nervous system is involved, pain, paresthesia, weakness, paralysis or mental disturbances may be present. Anorexia, stomatitis, glossitis, atrophy of the tongue, achlorhydria, loss of specific ferments, diarrhea, loss of tone of the gastrointestinal tract and ulceration of the intestine indicate involvement of the alimentary tract. If the hemopoietic system is affected, the patient may have macrocytic or microcytic anemia. Hemorrhage, easy bruising, edema and nutritional heart disease result from impairment of the cardiovascular system. A lack of adequate vitamin intake is particularly common in association with poverty, chronic addiction to alcohol, improper dietary habits and organic disease.

#### FUNCTIONS OF SOME INDIVIDUAL VITAMINS

Vitamins A and D, which are members of the fat soluble group, occur together in cod liver oil and other fish liver oils. These vitamins customarily are used together therapeutically.

Vitamin K is classified as a fat soluble compound, although water soluble synthetic compounds having vitamin K activity are now available. Vitamin K should be considered as a special substance essential for the maintenance of a normal concentration of prothrombin in the blood. Absorption of this vitamin is dependent on the presence of bile in the intestine, and synthesis probably depends on the intestinal flora. Except for hemorrhagic disease of the newborn where the cause has not been clearly established, a deficiency is usually the result of faulty absorption rather than an inadequacy of vitamin K in the diet.

Vitamin E has been shown to be necessary for the reproduction of the rat and the mouse, but there is no satisfactory evidence that it serves the same function in man. Extensive studies of the role of vitamin E in the treatment of various degenerative diseases have not established its value in the treatment of these conditions.

The vitamins of the B complex are water soluble and are found in such natural products as yeast and liver. Viable yeast and liver cells function as an active laboratory, so that the essential chemical changes necessary for the maintenance of life may go on. Components of the vitamin B complex are intimately concerned with carbohydrate metabolism. They appear to be essential constituents of enzymes which control certain oxidation-reduction systems in the living cell. This is fairly well established as far as thiamine, nicotinic acid and riboflavin are concerned. Ascorbic acid (vitamin C) is a member of the water soluble group and is specifically concerned in the prevention and treatment of scurvy.

#### METHODS OF THERAPY

Prevention of vitamin deficiency diseases usually involves the administration of an adequate diet. Supplements of several vitamins may be necessary, especially in the following situations: persons receiving (1) reducing diets for obesity, (2) restricted diets for treatment of allergy, (3) diet which is restricted during convalescence from severe infections which may exhaust the tissue reserves of vitamins, particularly the water soluble ones, (4) special diets for the treatment of peptic ulcer and (5) infant feeding.

In the treatment of deficiency diseases the problem is one of administering adequate amounts of the substances in which the patient is deficient in a way in which they can be utilized. Vitamin mixtures should not supplant preventive and therapeutic measures but should merely supplement them. All efforts to obtain an adequate diet should be made. The physician should realize that the more accurate the diagnosis of vitamin deficiency the more likely is he to avoid futile treatment with vitamin preparations. Therapy should be directed along three lines: (1) Conditions causing excessive requirements for the vitamins should be eliminated wherever possible, (2) the substances should be administered in sufficient amounts to correct the deficiency, (3) symptomatic treatment and treatment for coexisting diseases should be given.

In order to treat a patient successfully, it is often necessary to combine specific vitamin therapy, symptomatic therapy and the treatment of coexisting diseases. The essence of treatment for deficiency diseases lies in the administration of foods rich in vitamins, supplemented by specific therapeutic agents. The foods included in the dietaries will depend on the nature of the deficiency, age, race, habits, taste and financial status of the patient concerned. The diet may quite properly be supplemented with appropriate vitamin preparations.

When the patient with deficiencies of the water soluble vitamins is at the point of death the parenteral injection of vitamins is always indicated. Therapy with vitamin K preparations, some of which are suitable for parenteral use, is particularly indicated for the correction of lowered prothrombin concentration due to extensive intestinal lesions interfering with absorption or, more frequently, to the deficiency of bile in the intestine owing to obstruction of the common bile duct. It is also indicated in the treatment of the hemorrhagic disease of the newborn resulting from inadequate prothrombin concentration of the blood.

## THE DESIRABILITY OF MIXED VITAMIN THERAPY

In 1935 the Council on Pharmacy and Chemistry of the American Medical Association gave consideration to polyvitamin mixtures and authorized publication of a report entitled 'Shotgun Vitamin Therapy'.<sup>1</sup> In that report mention was made of the commercial products then available on the market and there was a discussion of the available evidence regarding such mixtures. On the basis of its consideration the Council expressed the opinion that the vitamin mixtures were a form of the deplorable "shotgun" prescriptions of the past, formulated in the hope that if one ingredient doesn't hit another will. It was then concluded that the use of vitamin mixtures was not in keeping with progressive medical practice.

The Council recognized at that time the obvious economical advantage to the patient of prescribing multiple vitamin preparations rather than single vitamin preparations and some other advantages of multivitamin therapy, but these were at that time outweighed by so many uncertainties that no other decision seemed possible.

Since that time there have been many developments which have necessitated a reconsideration of this type of therapy. Chemists have succeeded in isolating and identifying a number of components of the vitamin B complex and pure synthetic compounds have been available for carefully controlled clinical investigations. These studies have been aided by the fact that methods for the diagnosis of vitamin deficiency diseases have been greatly improved. They have led to the definite conclusion that it is seldom there is a deficiency disease due to inadequate ingestion of but one vitamin. Infantile scurvy and rickets, which are both frequently seen uncomplicated, are notable exceptions. In pellagra it is to be expected that there will be deficiencies of thiamine and riboflavin as well as of nicotinic acid. Evidence of deficiencies of vitamins A and C is not uncommon in those areas where pellagra occurs most frequently. More exact information has been gained with respect to human requirements for vitamins. There has also been considerable advance in the technique of manufacturing multiple vitamin preparations and it is now possible to administer one small capsule or tablet containing a day's requirement of all the known essential vitamins. Accordingly the decision has been reached that the acceptability of multivitamin preparations will depend on their conformity with the principles here set forth.

## PRINCIPLES FOR THE FORMULATION OF ACCEPTABLE MIXTURES OF VITAMINS FOR THERAPEUTIC PURPOSES

Too often the many polyvitamin products that have been prepared have not been as useful as they might have been. Frequently it has seemed that mixtures have been compounded

TABLE 1—Minimum Daily Requirements of Vitamins for the Adult

|                        |                   |
|------------------------|-------------------|
| Vitamin A              | 4 000 U S P units |
| Vitamin B <sub>1</sub> | 1.0 mg            |
| Vitamin C              | 30 mg             |
| Riboflavin             | 2 mg              |
| Nicotinic acid         | No value stated*  |
| Vitamin D              | 400 U S P units   |

\* The Food and Nutrition Board of the National Research Council has recommended that 10 mg be considered the minimum adult human requirement of nicotinic acid.

without reference to the relative amounts of the vitamins present or to the needs of the patient. Some of the vitamin mixtures provide enormous doses of vitamins A and D and relatively insignificant amounts of riboflavin. There is lack of desirable uniformity of composition of vitamin mixtures, both qualitatively and quantitatively. There is need for more proper formulation of commercial preparations, more informative labeling and suitable restrictions of advertising claims.

The Councils believe that the amounts of vitamins in mixtures should bear a relationship to the normal daily requirements

The physician then may prescribe amounts of these vitamins which will bear some simple relationship as a fraction or a multiple of the estimated daily requirements. The dietary requirements for the vitamins are still under investigation, but sufficient information is available to permit one to state these physiologic constants with a reasonable degree of accuracy for the present purpose. As a result of evidence produced in public hearings, the Food and Drug Administration has adopted certain figures—as representing the minimum daily requirements of the

TABLE 2—Values Recommended by National Research Council

|                        |  |
|------------------------|--|
| Vitamin A              | 5 000 U S P units  |
| Vitamin B <sub>1</sub> | 1.8 mg   |
| Vitamin C              | 75 mg  |
| Riboflavin             | 2.7 mg   |
| Nicotinic acid         | 18 mg  |
| Vitamin D              | No values recommended<br>for adults 400 to 800<br>U S P units for children |

vitamins known to be essential in the diet. For the adult these figures are given in table 1.

It is of interest to direct attention also to the figures adopted by the Committee on Food and Nutrition of the National Research Council, which is now known as the Food and Nutrition Board for the amounts of vitamins that are desirable in the daily food intake. The values recommended by this board for the adult male weighing 70 Kg and eating a diet of 3,000 calories are given in table 2.

In the treatment of vitamin deficiencies, physicians may consider it desirable to administer larger quantities of the vitamins than are mentioned in the "minimum requirements" or the "recommended allowances" to which reference has been made. The problem of deciding on acceptable formulas for vitamin mixtures thus is not an easy one. It is necessary not only to give consideration to the items mentioned in the present report but also to the use for which any particular product is intended and the claims that may be made in advertising. For these reasons the Councils will give individual consideration to commercial mixtures of vitamins when such mixtures are compounded in proportions related to the minimum daily requirements as defined by the Food and Drug Administration.<sup>2</sup> Concerning the vitamin B complex, the Council on Pharmacy and Chemistry has voted to give consideration to preparations which meet the following specifications:

1 Mixtures of pure thiamine, riboflavin and nicotinic acid which provide in the recommended daily intake 1 mg of thiamine, 2 mg of riboflavin, 10 mg of nicotinic acid or simple multiples thereof.

2 Dry brewers yeast having as the minimum vitamin content per gram, 0.12 mg of thiamine, 0.04 mg of riboflavin and 0.250 mg of nicotinic acid.

3 Dried brewers yeast as described under 2 to which has been added riboflavin and nicotinic acid in such quantities that for each milligram of thiamine contained in the finished product there are present 2 mg of riboflavin and 10 mg of nicotinic acid.

4 A concentrate of the vitamin B complex from brewers' yeast as described under 2 and providing in the recommended daily intake 1 mg of thiamine (or a simple multiple thereof) and corresponding proportions of other known vitamins of yeast.

5 A concentrate of the vitamin B complex from liver containing in each gram not less than 0.25 mg of riboflavin.

6 A concentrate of the vitamin B complex from brewers' yeast fortified with riboflavin and nicotinic acid and providing in the recommended daily intake 1 mg of thiamine, 2 mg of riboflavin and 10 mg of nicotinic acid or simple multiples thereof.

7 A concentrate of the vitamin B complex from rice polishings fortified with riboflavin and nicotinic acid providing in the recommended daily intake 1 mg of thiamine, 2 mg of riboflavin and 10 mg of nicotinic acid or simple multiples thereof.

## CARCINOMA OF THE PROSTATE

Wolff found only 83 cases of prostatic cancer reported in medical literature up to 1899. Young, however, in 1906 reported 68 cases (21 per cent) of malignant growth among 318 cases of prostatic obstruction. Muir in 1934, in routine necropsies on men over 60, reported an incidence of 13 per cent. Rich (1935) announced an incidence of 14 per cent in 292 consecutive necropsies on men over 50. Moore, in a series of routine necropsies in Viennese hospitals in which serial sections of the prostate were cut, discovered an incidence of 17 per cent. Gaynor in 1938 studied multiple sections of the gland in one thousand necropsies on men over 40 and reported prostatic carcinoma in 18.4 per cent. Prostatic cancer is now recognized therefore as one of the most frequent types of malignant disease in men. The pessimistic attitude of the majority of urologists with regard to the prognosis of cancer of the prostate is accounted for by two factors: (1) the condition is without noticeable symptoms for a long time, (2) the growth displays a tendency to early invasion by perineural routes of the pelvis, sacrum, lumbar vertebrae and femur. In the series reported by Bumpus, 25 per cent of the patients had metastases when first seen, while Barney and Gilbert reported 58 per cent. The neoplasm, according to Bairinger, is radiosensitive in only 10 to 20 per cent. Advocates of Young's radical perineal operation maintain that a five year clinical cure may be obtained with this procedure in about 50 per cent of the cases. Colston, an enthusiastic supporter of the operation, points out that it is applicable only in cases in which the malignant growth has not extended beyond the capsule of the prostate gland or in the membranous urethra or beyond the bases of the seminal vesicles. In addition, metastases must not be demonstrable on physical or roentgenologic examination. Colston<sup>1</sup> admits that of

all the cases treated at the Brady Urological Institute over a period of fifteen years only 4 or 5 per cent were suitable for radical operation. Lowsley<sup>2</sup> states that the malignant growth is discovered in time to effect a cure by total extirpation in less than 5 per cent of the cases of carcinoma of the prostate gland. "Thus is because there are no symptoms in the early stages of the disease." Thompson and Emmett<sup>3</sup> say that all investigators who have made postmortem studies of carcinoma of the prostate submit evidence that metastasis and invasion of structures beyond the prostate are likely to occur early in the course of the disease even in cases in which the primary lesion is small. It would appear, therefore, that complete surgical extirpation is rarely possible.

Kutscher and Wolbergs,<sup>4</sup> while investigating the source of outpourings of acid phosphatase in the urine of men, discovered that normal adult prostate tissue is extremely rich in phosphatase, with optimal activity at about  $p_H$  5.0. The Gutmans and Sproul<sup>5</sup> found prostate phosphatase also in the primary prostatic tumor and at the site of distant metastasizing carcinoma of the prostate. The Gutmans<sup>6</sup> did not find a significant rise in acid serum phosphatase activity in disease of the prostate gland other than carcinoma with metastasis. They concluded that the determination of serum phosphatase activity at  $p_H$  4.9 may be of limited value in the diagnosis of metastasizing carcinoma of the prostate.

Huggins and Hodges<sup>7</sup> have recently reported interesting observations of the effects of castration on the activity of prostatic neoplasms. The rationale of this therapeutic measure is based on the fact that adult prostatic epithelium undergoes atrophy when androgenic hormones are greatly reduced or inactivated. In many instances malignant prostatic tumor is an overgrowth of adult epithelial cells. Huggins, Stevens and Hodges<sup>8</sup> have also reported the clinical effects of castration on 21 patients with advanced prostatic cancer who were observed during a twenty months period. Four of the patients have died, and unsatisfactory results were obtained in 2 additional men. In the 15 patients who were improved the objective clinical evidence included

increased appetite and a progressive gain in weight, improvement in red cells and hemoglobin values, decrease in pain and in objective neurologic signs in 2 patients who had compression of the cauda equina, decrease in size of the primary tumor on rectal palpation and at cystoscopic examination, stabilization or regression of bony metastases in roentgenograms and a decrease in the size of palpable lymph nodes which were the seat of metastatic cancer. The investigators believe that complete regression of the tumor had not taken place, although the depression of the tumor activity with resulting improvement of the patient in some cases was considerable. In about 20 per cent of the cases the results were unsatisfactory. Huggins and Hodges made serial observations of the levels of the acid phosphatase in the serum of 8 patients and demonstrated that castration and administration of estrogens caused significant decrease of this enzyme while administration of androgens increased it. In patients with elevation of serum acid phosphatase, castration caused a prompt and sharp reduction to or toward normal which was maintained for many months. When the reduction was not distinct, administration of diethylstilbestrol was effective in further lowering the phosphatase. Intramuscular injection of 25 mg of testosterone daily for eleven to eighteen days in 3 cases in which bony metastases were present caused an increase in the acid phosphatase of the serum. The patients complained of an increase of pain in the legs. The investigators feel that the improvement in the 15 cases was greater than that observed in any case in which far advanced or metastatic cancer was treated in any other way. They state that, when acid phosphatase is greatly increased (above 10 units), carcinoma of the prostate with metastasis has always been present, but prostatic cancer may be present without elevation of acid serum phosphatase, thus there are false negatives but no false positives.

The rich concentration of acid phosphatase in the prostate of the adult man as compared with the child may be regarded as a secondary sex characteristic of a chemical nature. Munger<sup>9</sup> treated 11 cases by irradiation of the testes with resection. He believes that slightly better results were obtained than were secured in cases treated by resection and irradiation exclusive of the testes.

Androgenic activity may be suppressed chemically by administration of estrogens or by surgical or roentgenologic castration. The clinical application of the knowledge of the effects of the androgens on the activity of the prostatic neoplasm by Huggins and his associates injects a note of optimism into the hitherto gloomy picture of advanced carcinoma of the prostate.

## SHAPE OF THE MOUSE ENCEPHALOMYELITIS VIRUS

Increasingly, physical and chemical tools are being applied to problems of medicine. Among them are tools for aiding in the purification and characterization of proteins. Since these substances are significant in many processes of the living organism, a clearer understanding of the nature and behavior of proteins will aid greatly in elucidating physiologic reactions in which they participate. Furthermore, the more recent demonstration that viruses, enzymes and certain hormones may be proteins is additional basis for the need for complete knowledge regarding this group of substances. For these reasons the construction and application of the ultracentrifuge in the laboratory of Svedberg in Uppsala and the development and use of electrophoretic procedures by Tiselius and his colleagues in Copenhagen are significant. The use of one or several of the techniques devised by these investigators has resulted in an enormous expansion of fundamental knowledge regarding proteins. It is now possible to determine with a high degree of accuracy the size and shape of protein molecules, from studies of this type the rodlike shape of certain of the viruses has been established. Of considerable interest is the recent observation by Gard and Pedersen<sup>1</sup> that purified virus of mouse encephalomyelitis has a molecular weight of the order of 52,000,000 and is a long, rodlike particle with a length approximately forty-six times its width.

The observation with regard to the shape of this virus is particularly valuable in explaining previously established facts regarding the mouse encephalomyelitis virus. The ready ultrafiltrability of the activity had led to the belief that the infectious agent would be of a relatively small molecular size. However, the latter conclusion was difficult to reconcile with other observations to the effect that the active agent was readily sedimented in the ultracentrifuge in fields of relatively low gravitational force, a finding which would appear to indicate a high molecular weight. However, the high degree of ultrafiltrability of infectious particles was rationalized by suggesting that the activity sedimented at low speeds in the ultracentrifuge was merely the adsorbed agent on high molecular weight impurities. The results of Gard and Pedersen now clarify the situation. In view of the extremely elongated nature of the virus of mouse encephalomyelitis, the exertion of pressure on solutions during ultrafiltration, it is apparent, results in an orientation of these virus rods in solution with the short axis perpendicular to the pores of the ultrafilter. Under these circumstances there is little resistance to the passage of the virus through the ultrafilter. It is as though one were trying to push a pencil through an opening of a size which would permit ready passage of the pencil only when the latter has its short axis perpendicular to the open-

9 Munger, A. D. Experiences in the Treatment of Carcinoma of the Prostate with Irradiation of the Testicles. *J. Urol.* 46: 1007 (Nov.) 1941.

1 Gard, S. and Pedersen, K. O. *Science* 94: 493 (Nov. 21) 1941.

ing Moreover, it is now evident that virus of mouse encephalomyelitis is indeed a molecule of enormous molecular weight, therefore the heavy, active particles which have been sedimented by low speed ultracentrifugation consist of purified material and not small amounts of the virus adsorbed on tissue proteins

The foregoing observations are of further importance in view of their possible contributions to studies of strains of the virus of human poliomyelitis, thus do the methods of physics and chemistry contribute to the advancement of medicine

### ELLIPTIC ERYTHROCYTES IN MAN

Although oval, elliptic or rodlike erythrocytes are occasionally seen in blood smears from healthy persons, a predominance of such forms is rare in the absence of severe anemia. Dresbach<sup>1</sup> of Ohio State University reported in 1904 that he had found 90 per cent of elliptic red cells in the blood smears of a mulatto medical student. Smears were sent to Arnet, Ehrlich, Ewald and Ewing, who considered the condition a congenital or developmental anomaly. This was no doubt the first authentic report of elliptocytosis in man. Sporadic cases were reported by Bishop, Sydenstricker, Huck and Bigelow, Beinhart, and Terry and his associates. Hunter and Adams<sup>2</sup> found in a group of sixteen persons of pure Dutch extraction twelve carriers of elliptic erythrocytes. A study of the Netherlands branch of the same family was reported by van den Bergh. A father, each of his eight children and three of his six grandchildren exhibited the anomaly. These authors believed that the anomaly is inherited as a dominant trait, a striking example of inheritance of an anomaly of a cellular component of the blood. The truly hereditary character of the trait was further shown by the presence of oval and rodlike erythrocytes in the blood of two newborn babies in the same group. The hereditary transmission of this condition was again emphasized by Cheney,<sup>3</sup> who in 1932 reported a study of a family consisting of forty-one members in three generations, fourteen of whom were carriers of a high percentage of elliptic red cells. Cheney did not find sufficient evidence to associate this anomaly with secondary anemia and with sickle cell anemia.

Huck and Bigelow<sup>4</sup> washed the erythrocytes from their patient in isotonic salt solution and then placed them in the normal blood serum from a member of the same blood group. The fresh preparations were made and sealed. Observations continued for three weeks did not show any change in the elliptic shape

of the cells. Normal red cells from a patient of the same blood group were washed three times in isotonic salt solution and were suspended in the patient's serum. Fresh preparations were made and sealed. The normal cells remained spherical over a period of three weeks, after which time the preparations dried. These authors also found that slightly hypotonic and slightly hypertonic salt solutions had no effect on the elliptic cells. Similar observations were made by Terry and his associates<sup>5</sup> and by other observers. These experiments demonstrated that the elliptic shape of the erythrocytes was not the result of any influence of the plasma on them but that the anomaly was inherent in the structure of the cell itself. Scharum-Hansen<sup>6</sup> studied the genesis of the elliptic cells by staining the sternal punctate of carriers of elliptic cells with supravitral stain. He was able to demonstrate that these cells appear during and immediately after the reticulocyte stage and thus represent old forms of red cells. Vischer<sup>7</sup> transfused blood from four persons whose blood contained from 80 to 95 per cent of elliptic red cells into recipients with normal red cells and belonging to the same group. Daily blood examinations revealed the complete disappearance of the elliptic cells from the blood of the recipients in from twelve to thirteen days. Since the life span of a normal round red cell is believed to be approximately thirty days, Vischer concluded that the transfused elliptic cells perished earlier because they represent the end stage of a red cell and are therefore closer to the end of their life span.

Wyandt and her associates<sup>8</sup> examined six hundred persons belonging to three interrelated families of pure German extraction. Of these, forty-three were located in Germany in the locality from which the ancestors of the three families emigrated in 1869. Eighty-six members were found to be carriers of elliptic cells. The possible relationship of the anomaly to anemia has been a controversial point. Wyandt and her associates point out that the persons whom they studied were singularly free from any type of anemia and were unusually healthy and long lived. Leitner<sup>9</sup> points out that, if families with normal red cells were investigated hematologically as thoroughly as families in which elliptocytosis occurs just as many cases of unexplained anemia might be detected as have been reported in connection with that anomaly.

Thus elliptocytosis appears to be a well differentiated anomaly whose cause is entirely unknown. The percentage of elliptic red cells in typical cases may be as high as 90. The diagnosis is not difficult. The principal blood condition from which it must be differentiated

entrated is sickle cell anemia. Sickle cell anemia is differentiated from elliptocytosis by the fact that it occurs almost exclusively in Negroes, by the influence of serum on the shape of the cells, and by the grave course of the disease, its hemolytic nature and the frequent existence of a mild degree of jaundice. The elliptic erythrocytes represent the smallest cellular carriers of certain hereditary characteristics. The anomaly is not to be considered a degenerative stigma. Either the anomaly is caused by mutation or it is directly inherited from distant ancestors. Remarkable is the fact that the discovery of this hereditary anomaly was made only within the last two decades.

## Current Comment

### THE RADIOCLAST EXPOSED

Since the death of Albert Abrams in 1924, before he had time to hitch himself up to one of his own machines, various commercial promoters have continued to manufacture devices in imitation of those with which he worked. Somehow our federal agencies have not apparently taken the necessary steps to establish that the promotion of such devices constituted fraud and deception. One organization, however, has publicized the fakery involved. In connection with this effort the manager of the Indianapolis Better Business Bureau had a serious investigation made of one such device. This device, known as the "Radioclast," is manufactured and sold by the Electronic Instrument Company of Tiffin, Ohio. The result of this investigation, which was publicized in a recent bulletin of the Better Business Bureau, fully justified the conclusion as to the fraudulent character of the Radioclast. The particular device investigated, known as Model 40, looks like a very expensive radio console 44 inches high, 30 inches long and 18 inches deep. As a matter of fact, "the present price of them is \$945.00." On opening the door of the Radioclast, one sees a control panel of highly polished black bakelite on which are symmetrically arranged twenty-four radio type control dials. Contact is made with a person by means of electrodes.

An investigative committee composed of physicians, physicists and engineers opened the apparatus and found that it was made of radio parts, some being especially modified, such as rotary switches. In general the parts were such as can be purchased in any electrical shop carrying radio equipment. The circuit, when traced, revealed an astonishing hook-up. Quoting from the Indianapolis Better Business Bureau Bulletin: "The device has been branded as a fake and a fraud by competent scientists who have examined it." "The Manager of the BETTER BUSINESS BUREAU,<sup>1</sup> in a public affidavit before the Indiana State Board of Medical Registration and Examination, branded the use of this device in the diagnosis and treatment of serious diseases as a fraudulent practice, and asked the

revocation of the licenses of certain 'doctors'." The conclusion of the investigating committee appointed to examine and report on the Radioclast, Model 40, is

The Committee has made a careful scientific examination of the aforementioned apparatus and concludes that this Radioclast is totally incapable of accomplishing what is claimed for it as a diagnostic device, and the use of the device would not constitute competent scientific treatment for any disease that may be present.

### ESTIMATE OF NUMBER OF MYELINATED FIBERS IN THE PYRAMIDAL TRACT

Nerve fibers originating in the large pyramidal cells of the motor region of the cerebral cortex or the precentral gyrus pass downward through other levels of the brain, and before entering the spinal cord many of them cross over in the decussation of the pyramids. The direct and crossed pyramidal tracts are the most conspicuous of the corticospinal tracts. Lassek<sup>2</sup> has classified and estimated the number of the mature myelinated fibers in the pyramid of the human medulla. He obtained two medullas shortly after the accidental death of a Negro man aged 20 and a Negro woman aged 18. With Weigert's technic he stained for myelinated sheaths five microsections taken just above the motor decussation. With an ocular micrometer he measured the diameter of 15,000 pyramidal fibers in each specimen and by sampling with a Whipple square estimated the number of pyramidal fibers. Knowing the area of the pyramidal tract, he was able to compute the total number of myelinated fibers at this level at about 688,800. The diameter of the fibers varied from 1 to 22 millimicrons, 89.57 per cent were classified as small (1 to 4 millimicrons in diameter), 8.7 per cent as medium (5 to 10 millimicrons in diameter) and 1.73 per cent as large (11 to 22 millimicrons in diameter). The pyramidal bundle forms about 30 per cent of the spinal cord in man. Lassek points out that the morphology of the pyramid does not harmonize with the view that the relatively scarce Betz or large pyramidal cells are the sole origin of the pyramidal tract. However, Levin and Bradford<sup>2</sup> have widened the concept of the Betz cell, in their opinion all cortical cells which give origin to nerve fibers which go to the spinal cord should be designated as Betz cells. If this view were tenable, Lassek says, on the basis of the fiber content of the pyramids, there would be a tremendous number of Betz cells and most of them would have to be smaller than they are believed to be. It remains difficult to give an accurate scientific description of just what constitutes such a cell. Nerve velocity is believed to be proportional to the diameter of the fibers, the larger nerve fibers conducting more rapidly than smaller ones. Lassek says that the unmyelinated fibers which comprise a formidable share of the total number of fibers, would be slow conductors and that only a small percentage of the pyramidal tract fibers are designed for speedy transmission of impulses.

# MEDICINE AND THE WAR

*In this section of The Journal each week will appear official notices by the Committee on Medical Preparedness of the American Medical Association, announcements by the Surgeon Generals of the Army, Navy and Public Health Service, and other governmental agencies dealing with medicine and the war, and such other information and announcements as will be useful to the medical profession*

## THE ARMY IS IN EXCELLENT HEALTH

The War Department announced June 29 that the Surgeon General reports that the health of the army is excellent. No general outbreak of acute respiratory disease occurred in the winter months, and compared to the previous winter, there was a reduction of 52 per cent for all diseases and 70 per cent for respiratory infections. Since the winter months, the admission rates to the army for all cases have showed a steady decline of nearly 25 per cent, due chiefly to a falling off in respiratory infections. The venereal disease rates are now lower than at any time since the beginning of mobilization, and the syphilis rate for the first five months for 1917 is the lowest in the history of the army. There has been a steady decline of as much as 30 per cent in cases of gonorrhea.

In recent weeks there have been numerous admissions to hospitals on account of jaundice, which has the characteristics, the War Department said, of catarrhal jaundice (epidemic hepatitis), but the total number of cases in the entire army has not been enough to appreciably increase the admission rate for all diseases. The War Department points out that this is definitely not yellow fever and it is not dangerous to the general public. The disease is being studied, however, by some of the outstanding medical scientists. Outside of the United States, health conditions in the army continue favorable. There have been no serious epidemics and only slight rises in admissions due to diseases peculiar to some of the new areas where the troops are established.

## MILD TINCTURE OF IODINE FOR WOUNDS

With the widespread interest in first aid instruction and the distribution of millions of first aid manuals throughout the country, the druggists have been swamped with calls for "Mild Tincture of Iodine, U S P," which has been adopted for first aid treatment by the Army, the Navy and the American Red Cross. Since reports indicate that some druggists express ignorance of the existence of such a product, the formula for Mild Tincture of Iodine, U S P follows:

|                 | Metric Formula   | Alternative Formula |
|-----------------|------------------|---------------------|
| Iodine          | 20 Gm            | 146 grains          |
| Sodium iodide   | 24 Gm            | 175 grains          |
| Diluted alcohol | to make 1,000 cc | 1 pint              |

Dissolve the iodine and the sodium iodide in sufficient diluted alcohol (equal parts of alcohol and water) to make 1,000 cc.

The label on this product should be somewhat as follows: Mild Tincture of Iodine. Contains 46 per cent alcohol. An antiseptic for application to cuts and wounds. There should also be a poison label followed by:

**ANTIDOTE**—Give starch, white of eggs or flour mixed with water. Follow with emetic of mustard. Give strong tea, coffee, stimulants of diluted alcohol, whiskey or 1 teaspoon of aromatic spirit of ammonia in water. Demulcent drinks of flaxseed, if needed.

According to E. Fullerton Cook, chairman of the Committee of Revision of the Pharmacopeia of the United States of America, pharmacists should always sell the U S P Mild Tincture of Iodine for first aid, not the strong (7 per cent) tincture of iodine, neither should they prepare the mild tincture by diluting the strong tincture, for then it will contain potassium iodide instead of sodium iodide, and the alcohol percentage will not be correct. Sodium salts are much better for application to a wound than are potassium salts. Dr. Cook's announcement

says that the strong (7 per cent) tincture of iodine should never be applied to a wound, as it evaporates quickly, leaving crystals of free iodine in the wound, which injure the tissues and prevent healing.

## ASSIGNMENT TO GREAT BRITAIN

Two members of the Subcommittee on Industrial Health and Medicine of the Health and Medical Committee, Dr. W. C. Sawyer and Mr. W. P. Yant, are now in Great Britain as representatives of the United States government to study the industrial hygiene program in British war industries. Dr. Sawyer is a new member of the subcommittee, replacing Dr. Lloyd M. Noland, who recently resigned.

## INSTRUMENTS FOR RESEARCH WORKERS

Research workers seeking instruments required in their work but difficult to find are invited to communicate with D. H. Killeffer, 60 East Forty-Second Street, New York, chairman of the newly appointed Committee on the Location of New and Rare Instruments of the National Research Council. The plan of the committee's activity is to assist in locating needed instruments of types not ordinarily available through accustomed channels.

Assistance is particularly desired from owners and builders of instruments falling within the new or rare categories which might be made available to others through sale or for temporary use under mutually satisfactory conditions.

## HEALTH PROTECTION FOR CALIFORNIA WAR WORKERS

A series of one day sessions will be held in seven centers in California from August 18 to August 28 on the health protection of war workers. The programs will interest physicians, industrial nurses, safety engineers and industrial managers. They will assist all physicians whose services are in any way being rendered to industrial workers. Some of the problems to be discussed will be medical relationships in industry, pulmonary diseases of industry, industrial hygiene in war production, medical and engineer control of occupational diseases, the physician's legal responsibilities and the surgical management of industrial injuries. These meetings will be sponsored by the California Medical Association, Committee on Postgraduate Activities and on Industrial Practice, Western Association of Industrial Physicians and Surgeons, and the California State Department of Public Health. Among the speakers will be Dr. Carey P. McCord, medical advisor to Chrysler Corporation, Detroit; J. J. Bloomfield, chief of the States' Relations Section, Division of Industrial Hygiene, National Institute of Health, U. S. Public Health Service, Bethesda, Md.; Donald E. Cummings, director, Division of Industrial Hygiene, University of Colorado School of Medicine and Hospitals, Denver; Dr. Harold T. Castberg, acting chief, Industrial Hygiene Service, California State Department of Public Health; and Carl H. Fry, chief, Industrial Accident Prevention Bureau, California State Industrial Accident Commission.

Only two other states, Iowa and Connecticut, have had such meetings for physicians who have been called on by the state to supervise the health of many thousands of workers in war industries.

## WAR PRODUCTION DRIVE AND INDUSTRIAL HEALTH

Shortly after the joint meeting in April of the National Conference of Governmental Industrial Hygienists with the Subcommittee on Industrial Health and Medicine of the Health and Medical Committee a series of conferences between various units of the War Production Board and the Division of Industrial Hygiene was initiated by Mr. Charles Taft, assistant coordinator of defense health and welfare services. As a result of these conferences a letter signed by the chairman of the War Production Board, the chairman of the War Manpower Commission, the under secretary of war, the under secretary of navy, the land-force administrator and the chairman of the Maritime Commission was mailed on June 5 to about one thousand labor management production drive committees, which have been organized by the War Production Board in war contract plants throughout the country. This letter urged the committee to make health conservation an essential part of the production drive, through the organization of industrial hygiene and medical services in the plants and through attention to public health services and medical facilities in their communities. Within one week after the letter was mailed eighteen plant committees wrote to the U. S. Public Health Service for advice on the development of health conservation activities. The Division of Industrial Hygiene has referred these committees directly to their state industrial hygiene directors and has informed the industrial hygiene directors of this action. In addition, the division has prepared a detailed outline of an industrial hygiene program for the information of these committees. Copies of the outline may be obtained on request to the division.

## COMMITTEE URGES REFORM IN PERSONNEL POLICIES OF HOSPITALS RELATED TO NURSING

On April 29 the Subcommittees on Nursing and Hospitals of the Health and Medical Committee in the Office of Defense Health and Welfare Services adopted the following resolution:

WHEREAS There will be a steadily increasing demand for nurses for military services and for the civilian population for the next two or three years and

WHEREAS Many inactive nurses and private duty nurses must be brought back into service in civilian institutions and

WHEREAS Many graduate nurses are being attracted into other occupations because of more desirable employment and salary conditions and

WHEREAS It is becoming increasingly difficult to attract well qualified young women into schools of nursing because of the competition with other fields and

WHEREAS We are faced with a serious shortage of graduates and student nurses

Therefore The Subcommittee on Nursing and the Subcommittee on Hospitals of the Health and Medical Committee join in calling to the attention of hospital authorities the revised Manual of the Essentials of Good Hospital Nursing Service published by the American Hospital Association and the National League of Nursing Education with the urgent request that the personnel policies therein be thoughtfully reviewed in relation to the policies effective in their institutions in order that graduate nurses may be encouraged to remain in institutional service rather than to go into non nursing work and that a large number of qualified young women may be attracted to enter schools of nursing

It was the opinion of the committee that the shortage of graduate nursing personnel in civilian institutions was in many instances largely due to their personnel policies and salaries

## ARMY PHYSICAL STANDARDS MODIFIED

The War Department has stated that the army physical standards have been modified effective August 1 in order to call into limited military service under a regular quota system men now in class 1-B due to minor physical defects. Among the 1-B eligibles are men whose weight and chest circumference are under or over the standard set for class 1-A and who are not in class 4 who have a minimum of 20/400 in one or both eyes without glasses if correctable with glasses to 20/40 in either eye, whose hearing in one or both ears is not less than 5/20 who have lost an entire thumb on either hand or who have lost three entire fingers, provided the thumb remains

## NASSAU COUNTY PROFESSIONAL TRAINING CORPS

About 200 physicians and dentists in Nassau County, New York, met in Hempstead April 7, 1942 and formed the Nassau County Professional Training Corps, in response to a call signed by Dr. Arthur C. Martin, now adjutant of the corps. The object of the organization has been to prepare the members for military service. They have met weekly to drill under the command of Paul Brown, a former infantry captain, and also to hear lectures by army and navy officers. The speakers at these meetings have been Dr. Louis H. Bauer, formerly a colonel in the medical corps of the army, Commander Page O. Northington M. C., U. S. Navy, Major Harry Marcus, Post Exchange officer at Mitchel Field, Major James M. Mullen, Dental Corps, U. S. Army, Captain Reynolds Hayden, M. C., U. S. Navy, Captain John Groopman, flight surgeon, M. C., U. S. Army, Captain John Landers, Quartermaster Corps, U. S. Army, Frank Entwistle D.D.S., formerly first sergeant in the Medical Department, U. S. Army, Colonel Henry Harmeling, Judge Adjutant General's Department, U. S. Army, Arthur C. Martin, formerly major in the Medical Corps of the U. S. Army, and Major Paul Geigrich, U. S. Army. The several members who have already gone into active military service have reported that the preliminary instruction received as a member of the Nassau County Professional Training Corps was of distinct benefit to them.

## CONFERENCE ON MEDICAL SERVICE IN INDUSTRIAL AREAS

The Subcommittee on Industrial Health and Medicine of the Health and Medical Committee met in the conference room of the Federal Security Agency June 15-16. Marked for special attention on the agenda was the extreme difficulty in which the war industries are finding themselves with respect to obtaining and retaining personnel for their medical services. The subcommittee considered the definition of 'an essential man' in government and private industrial hygiene services and was expected to make recommendations to the War Manpower Commission through the Procurement and Assignment Service at its meeting on June 22. Recommendations will also be forthcoming on the nutrition in industry program. Dr. Townsend presented the progress report of the Division of Industrial Hygiene, National Institute of Health. Surgeon General Parran and other members of the staff, together with Dr. A. P. McCormack, state health commissioner of Kentucky, also met the subcommittee to consider problems of medical care in critical war areas.

## EMERGENCY MEDICAL FIELD KITS

The Medical and Surgical Relief Committee of America, with headquarters at 420 Lexington Avenue, New York City, has presented to the general hospital in Lawrence, Mass., completely stocked chests of supplies for the hospital's several mobile units each of which is staffed by four doctors and eight first aid workers. The equipment in each of these chests is valued at \$110. It is not possible for the Medical and Surgical Relief Committee to present such units to all medical squads as its means are limited.

The committee on June 4 presented two emergency field kits to the Civilian Defense Council of Charleston, S. C., which were assigned to the casualty stations at North Charleston and Chicora. These kits were developed as a result of actual experience in air raids in London. None of the eight casualty stations in Charleston proper had on June 5 been supplied with equipment.

## RUSSIAN WAR RELIEF

Russian War Relief, Inc., with headquarters at 535 Fifth Avenue, New York City, announced, May 28, that in the eight months since it was organized it has expended \$1,128,949.23 for relief supplies for use in the Soviet Union and is increasing its rate of shipments each month. The group is conducting a campaign for six million dollars this year.

### CAMPAIGN TO INDEX BLOOD TYPES OF WORKERS

A campaign to index the blood types of a hundred thousand industrial workers of Baltimore has been started by the Emergency Medical Service of the Baltimore Committee on Civilian Defense, according to Dr. Reid Edwards, director of the service, the *Baltimore Evening Sun* reports. The drive will enable the medical service to provide quick transfusions in the event the city is attacked. The names of workers typed will be registered with the medical service and with various hospitals throughout the city and, in the event of an emergency, volunteers will be reached by means of radio and newspapers.

The blood tests of plant workers will be undertaken by doctors and nurses at the places of the workers' employment and at such times as will not interfere with production schedules. The testing and classification of the blood will be taken care of in six hospital laboratories.

### FLORENCE NIGHTINGALE'S CARRIAGE

According to the June issue of *St. Thomas's Hospital Gazette*, Miss Florence Nightingale's carriage was among the casualties in the hospital blitz. As well as losing a wheel it suffered much other damage. Now, thanks to the generosity of Mr. and Mrs. Bradshaw, it is repaired and renovated and returned to a glory such as only its first owner can have seen before. It returned in state across Westminster Bridge, with nurses for passengers, and a driver clad in the uniform of Miss Nightingale's day. Ensconced once more within the hospital walls, it is now on view.

### EMERGENCY MEDICAL FIELD SETS FOR ALASKA

Eight emergency medical field sets completely equipped for the use of physicians in potential target areas were sent on June 18 to the Territorial Department of Health at Juneau, Alaska, by the Medical and Surgical Relief Committee of America, 420 Lexington Avenue, New York. Each set consists of two portable kits containing instruments, medicines, antiseptics and dry cells to provide power for lighting. The sets will be distributed to Dr. Thomas Morcom, Nome, Dr. Harold Sogn, Anchorage, Dr. F. B. Gillespie, Fairbanks, Dr. W. H. Chase, mayor of Cordova, the Griffin Memorial Hospital, Kodiak, Dr. Ray G. Banister, Seward, Dr. Dwight Cramer, Ketchikan, and Dr. William Charteris, Sitka.

### INVENTORY OF WATER SUPPLY EQUIPMENT

Water department executives and sanitary engineers throughout Michigan were scheduled to meet in June to inventory the chlorination units, the amount of chemicals in stock, power and pumping capacities, water pipes and other equipment so that, if the emergency arises, Michigan cities may shift quickly needed equipment to the scene of extensive damage resulting from air raids. The survey was ordered, according to the *Detroit News* by the Michigan Citizens Defense Corps emergency medical services division and included also complete information on the number and experience of water department personnel.

### HOSPITAL CONTRIBUTES RUBBER PIL- LOWS TO SALVAGE DRIVE

The officers of Mount Sinai Hospital, New York, in ransacking the institution for scrap rubber, decided to turn in the sponge rubber pillows on which patients could lie and listen through radio earphones concealed inside. The one hundred and forty sponge pillows turned over to the government contain 400 pounds of high grade rubber. The hospital installed a central radio system in 1931 providing one hundred and forty rubber pillows with earphones. It has now been discovered that patients can listen comfortably to the radio simply by resting the earphones next to them in bed.

### SOCIETY OF MEDICAL DEPARTMENT OFFICERS AT FORT DEVENS

Capt. Charles C. Verstandig, M. C., U. S. Army, who is now on duty some 6,000 miles away, writes that he receives his copy of *THE JOURNAL* regularly and has noticed the item "Society of Medical Department Officers at Fort Devens" in the issue of June 6. He says that this society was organized in the fall of 1940 instead of 1939 for the purpose of furthering the progress of medical science "while we medical officers were in the armed forces." He was responsible for its organization and was elected its first secretary, the first president of the society was Col. Henry P. Carter, M. C., U. S. Army, and the treasurer Capt. (now Major) Oscar B. Griggs, M. C.

### TEACHING DAY IN WAR MEDICINE AND SURGERY

The Medical Society of the State of New York sponsored a teaching day on war medicine and surgery in Elmira, June 25, under the auspices of the Chemung, Schuyler, Steuben, Tioga and Tompkins county medical societies. Dr. Forrest I. J. Young, Rochester, spoke on "The Care of Soft Tissue Injuries" and Dr. Emmett A. Dooley, New York, "Treatment of Burns." Dr. Carl A. R. Peterson, New York, addressed the evening session on "The Care of Head Injuries."

### GAS DECONTAMINATION SCHOOL

The War Production Board has approved the construction of a gas decontamination school in Alameda County, Calif. Ralph E. Hoyt, county defense coordinator, has announced. A station is to be built near the Cowell Memorial Hospital on the Berkeley Campus of the University of California which will serve as a central training station for gas decontamination squads organized by the county civilian defense council.

### NAVY HOSPITAL BUILT ON GOLF COURSE

The U. S. Navy expects to occupy soon its new hospital unit of more than seventy-five buildings on what was the St. Albans Golf Club course in Queensborough, New York City. This hospital will replace the Naval Hospital at 263 Flushing Avenue, Brooklyn, and will provide general, surgical and psychiatric care for patients.

### EXPLOSION LABORATORY COMPLETED

An explosion laboratory, built of reinforced concrete topped by a hinged roof and specially designed to afford maximum safety to personnel, has been completed on the grounds of the National Institute of Health, Bethesda, Md. The laboratory will be used in the determination of the toxicity and potential health hazards of various old and new explosives.

### BLOOD BANKS

Capt. John B. Alsever, technical director of the blood plasma program of the Office of Civilian Defense, spent part of May at the University of Oregon Medical School, Portland, in conference with state officials to plan the blood donor program. The Office of Civilian Defense is aiding in gathering blood supplies for any crisis in coastal cities.

### FLIGHT SURGEONS

The following Ohio physicians have been assigned to duty as flight surgeons with units of the air corps: Major Warren M. Best, Xenia; Major George P. Tyler Jr., Ripley; and Capt. Richard L. Meiling, Columbus. John A. Riebel, Ashland; Earl Rosenblum, Steubenville.

### NEW ADDRESS FOR PROCUREMENT AND ASSIGNMENT SERVICE

The Procurement and Assignment Service for Physicians, Dentists and Veterinarians may now be addressed at 1400 Street N.W., Washington, D. C.

# ORGANIZATION SECTION

## MEDICAL LEGISLATION

### DISTRICT OF COLUMBIA

*Bills Introduced*—H R 7340 introduced by Representative Hebert Louisiana provides that notwithstanding any limitation relating to the time within which an application for a license must be filed the Commission on Licensure to Practice the Healing Art in the District of Columbia be directed to issue a license to practice osteopathy to Morris C. Augur on condition that he be found by the commission to be otherwise qualified to practice under the healing arts practice act. H R 7368, introduced by Representative Schulte Indiana provides for the issuance of a license to practice osteopathy in the District of Columbia to Charles Joseph Briggs.

### MEDICAL BILLS IN CONGRESS

*Changes in Status*—H R 7242 to authorize temporary appointments in the Army of the United States of officers on duty with the Medical Administrative Corps has passed the Senate with amendment. H R 1052 has been reported to the House by the House Committee on the Judiciary, proposing to amend section 40 of the United States Employees' Compensation Act so as to authorize chiropractors to treat the beneficiaries of that act.

*Bills Introduced*—S J Res 152, introduced by request, by Senator Russell Georgia, proposes to designate the third week of September of each year as 'National Employ the Physically Handicapped Week.' H R 7130, introduced by Representative Sauthoff Wisconsin, proposes to amend the Social Security Act to provide that aid by states to dependent children who are mentally incompetent, irrespective of age be included in computing grants by the United States to such states for aid to dependent children. H R 7215, introduced by Representative Rankin Mississippi, proposes to amend the Selective Training and Service Act of 1940 to provide compensation for members of local boards and for other persons who render services in connection with the work of such boards and whose compensa-

tion for such services is not otherwise provided for. Such persons will be compensated it is proposed, at the rate of \$5 a day for time actually spent by them in conducting or assisting in the work of the boards. H R 7243, introduced by Representative Vinson Georgia provides for the establishment of the rank and grade of rear admiral, dental surgeon, in the Dental Corps of the United States Navy. H R 7256, introduced by Representative Dworshak, Idaho, provides compensation for the injury, death and detention of certain employees of contractors with the United States resulting from war hazards. H R 7259 introduced by Representative Rolph, California, provides compensation for personnel sustaining disease or injury while performing civilian defense duties. H R 7273 introduced by Representative Secrest, Ohio proposes to amend the act providing books for the adult blind by authorizing an appropriation not to exceed \$20,000 for the maintenance and replacement of government owned reproducers for sound reproduction records for the blind. S 2597, introduced by Senator Hughes, Delaware, for Senator Reynolds, North Carolina, proposes to provide for the appointment of chiropody officers in the United States Army in such numbers as will provide at least one chiropodist for each base hospital and training camp. Such officers it is proposed, will be commissioned in the Medical Corps of the Army in such grades as the Surgeon General deems advisable. S 2639, introduced by Senator Chavez New Mexico, provides that the pay and allowances of the members of the Army Nurse Corps be increased so that the pay of Army nurses will be equal to that of officers in the Army in the corresponding grades from second lieutenant to colonel. H R 7292, introduced by Representative Myers, Pennsylvania, proposes to amend the law relating to the civil service of the United States by providing that no person shall be discriminated against in any case because of his blindness or impaired visual acuity in examination, appointment, reappointment, reinstatement, reemployment, promotion, transfer, retransfer, demotion, removal or retirement.

## MEDICAL ECONOMIC ABSTRACTS

### BIRTHS AND DEATHS IN THE UNITED STATES

While the United States set a new record low for infant and maternal death rates in 1940, the Vital Statistics Summary United States 1940 finds that the general mortality rate increased slightly, from 10.6 per thousand to 10.8. This change was due largely to increases in deaths from heart disease, cancer and diabetes. The birth rate, however, also increased from 17.3 per thousand of population in 1939 to 17.9 in 1940 which is the highest recorded from the birth registration area since its completion in 1933. Possibly this indicates a cyclic change closing a long period of a declining birth rate.

This increase in birth rate has been accompanied by a reduction of the infant mortality rate to 47.0 per thousand live births in 1940 which was the lowest ever recorded for the birth registration area. However, the provisional infant death rate for 1941 is 46.2 which would seem to predict a further decline. In 1915 the infant death rate was approximately 100, so that the last twenty-five years has seen a decline of about one half. It is estimated that this amounts to the saving of the lives of 973,626 infants that would otherwise have been among the 3,264,365 infants that died during the past twenty-six years. This reduction in infant mortality has taken place in both the

white and Negro races, although the rate for Negroes is still considerably higher than that for the white race. The rate of decline of infant mortality has been slightly greater for the Negroes than for the white race.

The lack of medical care in rural districts, of which so much has been said and written, did not raise the death rate on the farms to the level of the city population. The rural rate in 1940 was 9.8 per thousand of population, while in the cities of more than a hundred thousand residents it was 11.3. The highest rate (12.4) was in cities of between 2,500 and 10,000 population. Males have a decidedly higher death rate than females, 12.0 to 9.5 per thousand of population respectively. There is an even wider difference between the white and other races, the white being 10.4 and other races' 13.8.

A comparison of the crude death rates for thirty-three specified countries, of which the latest information is for the year 1937, shows that of nations with a dominant white population Chile has the highest death rate. Yet Chile is the only nation on the western continent that has an extensive system of sickness insurance. The only nations that have a lower death rate than the United States are Denmark, Uruguay, Norway, New Zealand, Australia, Canada, Union of South Africa and the Netherlands. Denmark is the only one of these countries that has a nationwide system of compulsory sickness insurance.

## Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST SUCH AS RELATIVE TO SOCIETY ACTIVITIES, NEW HOSPITALS, EDUCATION AND PUBLIC HEALTH)

### ALABAMA

**Dr Beach Goes to Children's Bureau**—Dr Bessie Mac Beach, associate in charge of the division of child hygiene of the state department of health, has been appointed regional medical consultant in maternal, child health and crippled children services of the Children's Bureau of the U S Department of Labor, with headquarters in New Orleans. Dr Beach graduated at the University of Cincinnati College of Medicine, Ohio, and has been with the Alabama State Health Department about two years. She formerly was on the staff of the bureau of child health of the Wisconsin State Board of Health.

### CALIFORNIA

**Society News**—Dr Joseph F McCarthy, New York, presented an outline of the progress in optics as it concerns the etiology of the past one hundred years—its influence on general medicine—before the Hollywood Academy of Medicine, July 9. Dr Charles B Huggins, Chicago, addressed the academy, June 18, in Los Angeles on "Cancer of the Prostate."

**Hospital Needs Physicians**—The Receiving Hospital Department for the city of Los Angeles has announced that many of its ambulance and hospital doctors have joined the armed forces. Physicians interested in emergency traumatic injury work should communicate with Dr Wallace Dodge, chief surgeon, 1337 Georgia Street, Los Angeles.

**Medical School Sponsors Camp for Diabetic Children**—Two groups of 60 diabetic children will be cared for at Whitaker's Forest, Fresno County, by the University of California Medical School, San Francisco. The first group of children will leave San Francisco July 19 and the second August 2. The university agricultural extension services makes available its 4-H club camp to the medical school, with camp fire amphitheater, large cement swimming pool, outdoor dining room and showers. Whitaker Forest, 60 miles east of Fresno, adjoins the General Grave Grove section of Kings Canyon National Park.

**Personal**—Dr Jacob J Singer, director of the Rose Lamport Graff Foundation at the Cedars of Lebanon Hospital and associate clinical professor of medicine, University of Southern California School of Medicine, Los Angeles, has been appointed medical director of the Los Angeles Sanatorium. Dr Ebon B McGregor, Lemongrove, has been appointed a member of the state board of medical examiners to succeed Dr Clark L Abbott, Oakland. Dr Percival Dolman, San Francisco, and Dr George Thomason, Los Angeles, were reappointed members of the board.

**Conservation of Human Resources in Wartime**—The University of Southern California, University Park, Los Angeles, sponsored a workshop on conservation of human resources in wartime, July 2-3, in cooperation with the U S Employment Service, California State Bureau of Vocational Rehabilitation, and the Southern California Social Service Council for the Hard of Hearing. Individual topics included Rehabilitation of War Disabled and Physically Handicapped Workers in War Industry, Employment of War Disabled and Physically Handicapped Workers in War Industries and Civil Service, Safeguarding the Hearing of Preschool Children and Conservation of Hearing Programs in Schools.

### CONNECTICUT

**Honorary Degrees Conferred**—The Connecticut State Medical Society, during its recent sesquicentennial celebration in Middletown, conferred the honorary degree of doctor of medicine on Dr Alice Hamilton, Hadlyme, and Yandell Henderson, Ph D, New Haven. Dr Hamilton graduated at the University of Michigan Medical School, Ann Arbor, in 1893 and has been medical consultant to the U S Department of Labor. She was assistant professor of industrial medicine at Harvard Medical School, Boston, from 1919 to 1935. Dr Henderson had been a member of the faculty at Yale University, New Haven, from 1898, when he received his degree of doctor of philosophy, to 1938, when he became emeritus professor of physiology.

### DELAWARE

**Editorial Offices Moved**—The editorial offices of the *Delaware State Medical Journal* have been moved from 1022 Du Pont Building, where they have been for twenty-three years, to 618 Citizens Bank Building, Wilmington.

### GEORGIA

**Society Honors Dr Paullin**—The Fulton County Medical Society gave a dinner at the Piedmont Driving Club, Atlanta, July 7, in honor of Dr James E Paullin and to mark his election as President-Elect of the American Medical Association. Dr Paullin is professor of clinical medicine, Emory University School of Medicine, Atlanta, and once served as president of the Fulton County Medical Society and of the Medical Association of Georgia.

### INDIANA

**Student Loan Fund**—Mrs William M Loudon, Indianapolis, recently established the Lila B Loudon Scholarship Loan Fund with a contribution of \$1,000 to aid students in the Indiana University School of Medicine to complete their training. The contribution supplements a previous gift for the same purpose and serves as a memorial to her two sons.

**Society News**—Dr Wemple Dodds, Crawfordsville, was named president-elect of the Indiana Roentgen Society at its May meeting in Indianapolis, May 14, and Dr Chester A Stayton, Indianapolis, was installed as president. Other officers include Drs Cecil S Wright, Anderson, vice president, and Harold C Ochlsner, Indianapolis, secretary-treasurer.

### IOWA

**Case of Spotted Fever**—The first case of spotted fever for the current season and the one hundredth in Iowa since notification of the initial case in 1933 was reported on June 16 from Decatur County in the southern central part of the state. The patient was a child 5 years of age. Onset of symptoms was noted on June 5.

**Personal**—Dr Arthur Steindler, professor and head of the department of orthopedic surgery, State University of Iowa College of Medicine, Iowa City, was recently nominated to honorary professorship at the National University of Mexico. Dr Elmer L Lampe, Bellevue, has been appointed health officer of Lamotte.

### KANSAS

**Venereal Disease Among Selectees**—The Kansas State Board of Health recently conducted a venereal disease survey among 14,311 Kansans examined under the Selective Service Act. Of the total 388 were found to have syphilis. Eighty-two and seven-tenths per cent of the cases occurred in the eastern third of the state, with 72.6 per cent falling in areas now recognized as defense or war industry zones. Independence, the leading city, had a rate of 90.9 per thousand, which is twice the national rate, and Wyandotte County led other counties by a rate of 79.9 per thousand. The rate of 27.1 places Kansas ahead of such industrial states as Pennsylvania, New York, Illinois, Michigan and New Jersey. A total of 3,746 cases were reported by physicians during 1941. Hon John M Houston of Kansas discussed the survey in the House of Representatives, Washington, July 2, stressing that control of syphilis and gonorrhea is the number one public health problem. Our effort is hampered at countless points by two serious contagious diseases, he said. Representative Houston, in pointing out the need for tuberculosis programs in defense areas, stated that during 1941, 751 cases of tuberculosis were reported in the state, 82.6 per cent occurred in the eastern third of the state and 71.7 per cent in defense areas. The Kansas State Board of Health and county medical societies are cooperating in county-wide case finding and special educational programs.

### KENTUCKY

**Changes in Health Officers**—Dr James A Oatman, Murray, health officer of Calloway, will take over the duties of Trigg County. The new arrangement was caused by the resignation of Dr Leonard A Crosby, Eddyville, who has been in charge of Caldwell, Lyon and Trigg counties.

**Society News**—Dr Joseph Garland Sherrill, Louisville, gave a paper entitled "Carcinoma Study" before the Louisville Surgical Society on June 5 and Dr De Lou Perrin Hall, Louisville, presented a case report on "Trichobezoar of Stomach." The Louisville Society of Medicine was addressed on "Hypertension" by Dr Lytle Atherton, Louisville, on "Hypertension and Its Clinical Management."

## LOUISIANA

**Medal for Work on Tropical Diseases**—The Louisiana State Medical Society has awarded a medal to Drs Arthur L. Koven and William R. Whitehouse, 1942 graduates, respectively, of Louisiana State University School of Medicine and Tulane University of Louisiana School of Medicine, New Orleans, for their work on tropical disease and preventive medicine. The society has been planning a monument to be known as the Walter Reed Memorial in recognition of the Yellow Fever Commission's work in 1900. The house of delegates of the state society decided at its 1940 meeting that an annual prize be offered to a senior student to replace, temporarily, the erection of a monument to Dr. Reed. The actual medal has not yet been designed in view of the opinion held by some members of the society that the names of other members of the Yellow Fever Commission should be included on the medal. When this point has been settled, Dr. Koven and Dr. Whitehouse will be given the award. Dr. Koven has been doing graduate work in industrial medicine at the Medical College of Virginia, Richmond.

## MASSACHUSETTS

**Personal**—Dr. William Danieshek, assistant professor of medicine at Tufts College Medical School, Boston, has been appointed professor of clinical medicine.

**State Medical Election**—Dr. Roger I. Lee, Boston, was chosen president-elect of the Massachusetts Medical Society at its annual meeting in Boston May 25, and Dr. George L. Schadt, Springfield, was installed as president. Dr. Michael A. Tighe, Boston, is the secretary. The next annual meeting will be held in Springfield, the date to be determined later.

**New Director of Venereal Disease Control**—Dr. John B. Hozier, Boston, has been detailed as acting director of the division of genitoinfectious diseases in the Massachusetts Department of Health. He succeeds Dr. Ernest B. Howard, who has been named a special venereal disease control officer for the U. S. Public Health Service with headquarters in Omaha.

**Mental Health for Defense**—The Massachusetts Society for Mental Hygiene and the state department of mental health have prepared a pamphlet on "Self Discipline in War Time." The brochure offers suggestions for meeting problems arising from war hysteria. The Massachusetts Society for Mental Hygiene announces that it had planned to begin publication this spring of a new monthly bulletin to take the place of the *Mental Health Sentinel*, which had to be terminated with the January 1942 issue because of lack of funds. The society felt that the pamphlet would be of more interest at this time and plans to bring out its new monthly bulletin in the fall.

## MICHIGAN

**Administrative Changes at Herman Kiefer Hospital**—Mr. G. R. Harris, formerly superintendent of public health for the city of Detroit, has been appointed hospital administrator at the Herman Kiefer Hospital, Detroit, and Dr. Franklin H. Top, Detroit, director of the division of communicable diseases and epidemiology of the city department of health and the hospital has been named medical director.

**Typhoid Carrier Suspect Kept in Hospital**—A 40-year-old woman in Ypsilanti has been committed to University Hospital on a warrant as a typhoid carrier. The complaint was filed by Dr. Otto K. Engleke, health director of Washtenaw County, who charged that the woman had violated an order of confinement to her house issued on June 7. The woman, who is said to be in good health, has been under observation as a carrier since a child staying at her home a year ago contracted typhoid.

**Ragweed Pollen Count**—The Michigan Department of Health began its third ragweed pollen study on July 1 with observers at forty-four places in the upper and lower peninsulas cooperating to provide a pollen count throughout the summer. The information assembled will serve as a guide to persons having hay fever. The pollen counts are made by exposing glass slides, covered with a film of grease to hold the pollen grains, and counting the grains caught in twenty-four hours. Last year's survey showed that pollen counts were low in the northern part of the state, some inland areas and some along the lake shorelines. Results of the pollen surveys in 1940 and 1941 reveal that pollen contamination of the air in Michigan reaches its peak during the last week of August and the first week of September.

## MISSISSIPPI

**Physician Honored for Work on Oxygen**—The Mississippi State Medical Association was asked during its annual meeting in May to give special recognition to Dr. Peter W. Rowland, professor of pharmacology at the University of Mississippi School of Medicine, University. The recommendation came from a committee report which indicated that Dr. Rowland had been the first physician to administer oxygen through a nose tube in the treatment of pneumonia, according to the *Mississippi Doctor*. He used the device on a patient in 1903. The report was presented after investigations to determine the accuracy of this claim. In 1934 Dr. Rowland was president of the Mid-South Post Graduate Medical Assembly, of which he is considered the only living charter member. In 1939 the University of Mississippi voted to name its medical library in honor of Dr. Rowland, who two years previously had volunteered his services to augment the library, becoming field director.

## NEW YORK

**Hospital Additions**—The Methodist Hospital, Brooklyn, dedicated its new nine-story Buckley Pavilion, June 21. The new construction replaces the old Surgical Pavilion erected in 1883 and was named in honor of Rev. Dr. James Monroe Buckley, first president of the hospital board of managers, a post which he held for thirty-five years. The five hundred thousand dollar wing of the Home for Aged and Infirm Hebrews, New York, was dedicated on June 21 and opened to the public on June 28. The unit is four stories high and offers accommodations for 52 patients. The building is a memorial to Florentine Scholle Sutro, trustee for forty-one years and vice president for nine years.

## New York City

**Dr. Kleinschmidt Resigns from Tuberculosis Association**—Dr. Harry E. Kleinschmidt, New York, has announced his resignation as a member of the staff of the National Tuberculosis Association, effective at the end of the summer when certain projects now under way are completed. Dr. Kleinschmidt joined the association in 1927 as supervisor of the medical service. He has been director of health education since 1929.

**Committee on Wartime Care for Children**—Mayor La Guardia has appointed a special committee on wartime care of children in New York consisting of the commissioners of welfare and health and an official from the board of education. The committee's purpose is to review all available data and information concerning the problem of child care in New York and to determine the best method of meeting necessary needs. The committee will be responsible for making certain recommendations to care for children whose mothers are engaged in wartime work. It will not administer or operate services but will work out a program by which proper departments and private agencies cooperate on a unified basis to provide the necessary services and secure state and federal approval in establishing these programs.

**Dr. Hinsey Named Dean of Cornell**—Joseph C. Hinsey, Ph.D., professor and head of the department of anatomy, has been appointed dean of Cornell University Medical College. Dr. Hinsey succeeds Dr. William S. Ladd, dean of the college since 1935, who retired recently because of ill health but who will continue as professor of clinical medicine. Dr. Hinsey has been acting dean of the medical college for the past six months. He received his degree of doctor of philosophy at Washington University, St. Louis, in 1927. Before becoming professor of anatomy at Stanford University in 1930 he taught at Northwestern, Western Reserve and Washington universities. In 1936 he was appointed professor and head of the department of physiology at Cornell, and three years later he became head of the department of anatomy.

**Increased Prevalence of Meningococcic Meningitis**—One hundred and seventy cases of meningococcic meningitis occurred in New York City between January 1 and May 11, as compared with 38 in the same period during 1941, according to the *Quarterly Bulletin*. More than 80 per cent of the cases were reported in the boroughs of Brooklyn and Manhattan. The most striking difference between this and previous outbreaks is the reduction in case fatality. The number of persons dying per hundred cases has been 188 as compared with the average case fatality for the past five years of 41 per cent. The bulletin points out that the great reduction in the case fatality rate is due to earlier recognition of the disease and prompt and effective use of the various sulfonamides. Since 1936 the incidence of the disease has decreased yearly until a new low was reached during 1940 when only 48 cases occurred.

**Vacations Start for Diabetic Children**—On July 1 the first contingent of 30 children, aged 7 to 13, were taken to Camp Nyda at Wallkill, which has served for six years as a summer camp for underprivileged diabetic children of the tenements. The camp is under the sponsorship of the New York Diabetic Association, which accepts contributions to defray expenses of the camp. Last year one hundred thirty-seven subscribers and eighty-one additional contributors maintained 94 of the diabetic children at the camp. It is estimated that \$25 is needed to provide a week's stay in the camp. The medical department of the camp is under the direct supervision of Dr Herman O Mosenthal, clinical professor of medicine, New York Post-Graduate Medical School, Columbia University. Officers of the New York Diabetic Association include Drs Charles F Bolduan, president, George E Anderson, first vice president, Frederick W Williams, second vice president and medical chairman of the camp committee, Beverly Chew Smith, secretary, and Miss Virginia Elgelhardt, executive secretary. The scientific care at the camp is provided by a staff of dictitians, nurses and a resident physician, for psychologic reasons, children there are taught self treatment for the disease.

### NORTH DAKOTA

**State Medical Election**—Dr Frank I Darrow, Fargo, was chosen president-elect of the North Dakota State Medical Association at its annual meeting in Jamestown, May 18-20, and Dr Alfred R Sorenson, Minot, was inducted into the presidency. Drs Arne O Arneson, McVile, and James F Hanna, Fargo, were elected vice presidents and Dr William W Wood, Jamestown treasurer. Dr Leonard W Larson, Bismarck, is the secretary. The 1943 session will be in Bismarck. Among the speakers at the recent meeting were:

Dr Ralph A Reis, Chicago, Bleeding in Pregnancy.  
Dr George M Construs, Bismarck, Glaucoma and the General Practitioner.  
Dr Lawrence R Boies, Minneapolis, The Symptom of Headache.  
Dr Erling S Platon, Minneapolis, The Care of the Premature Infant.  
Willard H Wright, Ph D, Bethesda, Md., Medical and Public Health Aspects of Trichinosis.  
Dr Stanley R Maxeiner, Minneapolis, Emergency Treatment of Fractures.  
Dr Verl G Borland, Fargo, The Emergency Treatment of Lacerations.  
Dr Gordon R Kammorn, St Paul, The Depressed Patient.

A symposium on encephalomyelitis was conducted by Herald Cox, Sc D, Hamilton, Mont, and Drs Larson, Arthur C Fortney, Fargo, Paul J Breslich, Minot, and Edward C Rosenow, Rochester, Minn. Other features included a round table discussion and a clinic on nervous and mental diseases. The North Dakota Health Officers Association held its annual conference May 18 and speakers included Drs Calvin C Applewhite, Kansas City, Mo., on "The Importance of Local Health Service in National Defense" and Dr Wright, Bethesda, "The Epidemiology of Trichinosis as Indicated by Findings of Trichinae in a Random Sampling and Other Samplings of the Population of the United States."

### OKLAHOMA

**Dr Halpert Appointed Director of Laboratories**—Dr Bela Halpert has been appointed director of laboratories of the State University and Crippled Children's Hospitals and professor of clinical pathology at the University of Oklahoma School of Medicine, Oklahoma City. Dr Halpert, who graduated at the Deutsche Universität Medizinische Fakultät, Prague, in 1921, has been assistant professor of pathology and bacteriology at Louisiana State University School of Medicine, New Orleans, since 1937.

**Program of Immunization**—An immunization program is under way in Oklahoma as a part of the national plan to immunize all children against common communicable diseases as a wartime measure. The Oklahoma State Medical Association approved the project, which was given over to local county medical societies for control. Each county is making its own financial arrangements. Biologic products are being furnished by the state health department, and the civilian defense organization in Oklahoma is assisting in the administration of the program.

**Sterilization Law Declared Unconstitutional**—The U S Supreme Court, in a unanimous decision June 1, declared unconstitutional a 1935 statute of the state of Oklahoma authorizing the sterilization of certain classes of habitual criminals, newspapers reported on June 6. The statute authorized sterilization of persons convicted for the third time of "crime amounting to felonies involving moral turpitude" and exempted offenses "arising out of the violation of the prohibitory laws, revenue acts, embezzlement or political offenses." The report stated that the case on which the supreme court gave its verdict involved an Oklahoma court order for the sterilization of a man con-

victed once of stealing chickens and twice of robbery with firearms. One opinion declared that there are limits to "the extent to which a legislatively represented majority may conduct biological experiments at the expense of the dignity and personality and natural powers of a minority."

### PENNSYLVANIA

**District Meetings**—The Fourth Councilor District of the Medical Society of the State of Pennsylvania met on July 1. Among the speakers were Drs William L Estes, Bethlehem, on "Early Diagnosis of Cancer of the Colon" and Sydney I Hawley, Danville, "History of Montour County Medical Society."—The Ninth Councilor District of the Medical Society of the State of Pennsylvania was addressed on June 25 in Punxsutawney, among others, by Drs Thomas R Griest, Pittston, on "The Place of the General Physician in the Conservation of Vision Campaign", Edward J McCague, Pittsburgh, "Present Day Conception of the Etiology and Treatment of Carcinoma of the Prostate", Floyd H Bragdon, Pittsburgh, "Headache—Underlying Causes" and James E McClenahan, Pittsburgh, "Constipation—Underlying Causes." Fifty year testimonial certificates were given to Drs William C Newcome, Big Run, Thomas H Newcome, Cowansville, and Jay C Booher, Falls Creek.

### Philadelphia

**Program to Reduce Infant Mortality**—Five "baby stations," equipped with incubators and other medical services available to all physicians at any hour, were opened on July 2 as a part of a new program to decrease the rate of infant mortality due to premature births, according to the New York Times. At the same time a city ordinance became effective requiring physicians to report within two hours the births of all babies weighing less than 5½ pounds. The entire program is under the auspices of the Philadelphia Department of Health.

**Alvarenga Prize Goes to Dr Cohn**—The College of Physicians of Philadelphia awarded the Alvarenga Prize, July 14, to Edwin J Cohn, Ph D, professor of biological chemistry and head of the department of physical chemistry, Harvard Medical School, Boston, in recognition of his distinguished contribution to the knowledge of blood proteins. The prize was established by the will of the late Pedro Francisco DaCosta Alvarenga, Lisbon, Portugal, an associate fellow of the college, to be awarded annually by the college on each anniversary of the death of the testator, to the author of the best memorial on any branch of medicine which may be deemed worthy of the prize.

### SOUTH DAKOTA

**State Medical Election**—Dr Joseph C Ohlmacher, Vermillion, was chosen president-elect of the South Dakota State Medical Association at its annual meeting in Sioux Falls, May 13-15, and Dr Nelus J Nessa, Sioux Falls, was installed president. Dr Daniel S Baughman, Madison, is vice president and Dr Clarence E Sherwood, Madison, secretary-treasurer.

### TEXAS

**Special Society Elections**—Dr Marvin L Grice, Houston, was elected president of the Texas State Heart Association at its annual meeting in Houston, May 11, Dr Merritt B Whitten, Dallas, vice president, and Dr Walter B Whitmire, Wichita Falls, secretary-treasurer. The association will hold its meeting in San Antonio next year.—The Texas Dermatological Association elected Dr James Lewis Pipkin, San Antonio, president at its recent annual meeting, Dr Paul H Power, Waco, vice president, and Dr Duncan O Poth, San Antonio, secretary-treasurer.—Officers of the Texas Railway and Traumatic Surgical Association include Dr Walter L Reeves, Greenville, president, Travis M Harrell, Corpus Christi, and Frank L R Snyder, Fort Worth, vice president, and Ross B Trigg, Fort Worth, secretary-treasurer.—Dr Edward A Cayo, San Antonio, was elected president of the Texas Orthopedic Society at its annual meeting in Houston, May 11, Dr Fred A Bloom, Houston, vice president, and Dr Edward T Smith, Houston, secretary.

### VERMONT

**Personal**—Dr Francis J Bean, assistant superintendent of the University of Nebraska Hospital, Omaha, for ten years, has been appointed administrator of the Hunt Putnam Memorial Hospital, Bennington.—James Montrose Olmsted, Ph D, professor of physiology, University of California, was awarded an honorary degree of doctor of science at Middlebury College during the school's recent commencement. Dr Olmsted, who received his bachelor's degree at Middlebury in 1907, gave the annual Phi Beta Kappa address on "The Place of Physiology in a University Curriculum."

## WEST VIRGINIA

**Society News**—Dr Charles F Geschickter, Baltimore, discussed "Clinical and Experimental Aspects of Cancer of the Breast" before the Cabell County Medical Society in Huntington, recently.—The Kanawha Medical Society was addressed in Charleston, recently by Dr Emil Novak, Baltimore on "Endocrines in Gynecologic Practice"—Dr Curtis C Meehling, Pittsburgh, addressed a recent meeting of the Marion County Medical Society on "Indications for and Technique of a Proctologic Examination"

**University Opens Student Health Center**—The West Virginia University, Morgantown formally opened its new student health center on May 15. The \$150,000 building is three stories high. The first floor has a large waiting room, offices for four physicians and treatment rooms. The second floor houses the department of pathology and clinical microscopy, while the third floor has accommodations for 21 bed patients and is fully equipped for hospitalization. One ward may be used for an isolation ward. The staff consists of three full time physicians, three full time trained nurses and one full time laboratory technician. The center is under the direction of the university's school of medicine.

**Dr Pelouze Lectures on Gonorrhea**—Dr Percy S Pelouze, assistant professor of urology, University of Pennsylvania School of Medicine, Philadelphia, and recently appointed consultant for the gonorrhea control program for the United States Public Health Service, opened a series of lectures on gonorrhea in Charleston July 1-2. The Charleston talks were the initial ones in a statewide series to reach local health authorities and county medical societies. The state medical journal reported the following schedule: July 3 Huntington, July 5 Fairmont, July 7 Morgantown, July 8 Clarksburg, July 9 Parkersburg, July 10 Wheeling, July 17 Elkins, July 20 Logan, July 21 Williamson, July 22 Welch, July 23 Bluefield, July 24-25 Beckley, July 27 Lewisburg, July 29 Keyser and July 31 Martinsburg.

## PUERTO RICO

**Compulsory Physical Examinations**—A regulation has been placed in effect in Puerto Rico making it compulsory for all employees of the government, teachers, officials and employees of public and private schools, universities and colleges and all pupils over 13 years of age to have physical examinations including roentgenograms of the chest, at least once every two years or oftener if the commissioner of health thinks it necessary, according to the *Bulletin* of the National Tuberculosis Association. Employees and pupils refusing to comply with the regulation will be removed from their positions and places in the classroom until the examinations have been made. Reports will be made to the superintendents of the schools and to the commissioner of health on any active pulmonary tuberculosis found among the students, school or public employees. These persons will be excluded from schools and places of employment until they are no longer considered a menace to the health of others.

## GENERAL

**Winners of Cigarette Contest**—Dr Sylvester E Gould, Dearborn Mich, won first prize in a contest conducted by Philip Morris & Co Ltd during the recent annual meeting of the American Medical Association in Atlantic City, N J. Remarks on the research on the physiologic effects of smoking figured in the contest. The prizes were \$250 in war bonds. Second prize went to Dr Morton M Mayers, Los Angeles and the following took third prize: Drs Joseph A DeCaro Philadelphia, Julius Stark, Brooklyn, Leon Felderman Philadelphia and George G R Kunz, Tacoma Wash.

**Home Study Course in Ophthalmology**—The American Academy of Ophthalmology and Otolaryngology will open its home study course in the fundamentals of ophthalmology and otolaryngology on September 1. Registration for the course will close on August 15. The program is designed as a reading course in fundamentals primarily for residents who do not have the opportunity for formalized instruction in the basic sciences, but others planning to enter these specialties may register. Because of the limited faculty only fifty registrants each will be accepted in ophthalmology and otolaryngology. Applications should be sent to the office of the late Dr W B Wherry, 1500 Medical Arts Building Omaha, where they will be accepted in the order of receipt.

**Friedenwald Medal to Dr Einhorn**—The Friedenwald Medal of the American Gastro-Enterological Association was presented to Dr Max Einhorn since 1896 professor of medicine, New York Post-Graduate Medical School, Columbia Uni-

versity, New York during the association's annual meeting in Atlantic City, June 8, for outstanding achievements in the field of gastroenterology and for the invention and putting into practical use of many instruments of precision used in the study of digestive diseases. Dr Einhorn was born in Grodno, Russia, in 1862 and graduated at the Germany-Friedrich Wilhelm Gymnasium, Germany, in 1884. He was president of the American Gastro-Enterological Association from 1900 to 1902.

**Radioactive Substances Declared Hazardous for Children**—Occupations involving exposure to radioactive substances are declared hazardous to minors under 18 years of age in an order issued by the Children's Bureau of the U S Department of Labor, effective May 1. The order establishes an 18 year minimum age for employment in these occupations under the child labor provision of the Fair Labor Standards Act of 1938. Exposure to radioactive substances occurs in the manufacture of self-luminous compound (radium paint) and in its use when applied to the numerals and hands of watches, clocks and instruments or to buttons and other miscellaneous articles and in the manufacture of incandescent mantles. The Children's Bureau will provide on request, information as to what officials are responsible for issuing certificates of employment and age in each state. The findings on which the order is based are the result of careful investigation and are embodied in a report entitled 'Occupational Hazards to Young Workers, Report No 6—Radioactive Substances,' available on request from the Children's Bureau.

**Committee to Cooperate in Venereal Disease Control**—A National Advisory Police Committee on social protection was recently formed by Paul V McNutt, federal security administrator, to assist in the enforcement section of the federal government's social protection program. The program is based on an eight point agreement adopted jointly by the army, navy and Federal Security Agency and sets up the medical, legal and social principles for the control of venereal disease in wartime. The group met in Washington on June 30 in joint session with representatives of the army, navy, U S Public Health Service, Federal Bureau of Investigation, American Social Hygiene Association and the Office of Defense Health and Welfare Services, all of which have representatives on the committee. Objectives of the conference were to bring about an understanding of the government's program of venereal disease control among local and state law officials and to develop new and effective techniques of police enforcement pertaining to the repression and prevention of prostitution. Eliot Ness, director of the social protection section of the Office of Defense Health and Welfare Services, warned that the repression of prostitution as a venereal disease control was an essential wartime measure and that wherever voluntary cooperation of local law enforcement officials did not meet the problem the Department of Justice, by authority of the May Act, would step into those communities and clean them up.

## LATIN AMERICA

**Personal**—Plans are under way to observe the completion of fifty years in the practice of medicine of Dr Alejandro Ceballos, Buenos Aires, professor of clinical surgery, Faculty of Medicine, Buenos Aires. It is planned to present Dr Ceballos with a book of testimonials written by his friends in honor of the occasion.

**English Physiologist Lectures in Buenos Aires**—Dr Edgar S Adrian, since 1937 professor of physiology, Cambridge University, Cambridge, England recently gave a series of lectures in the National Academy of Medicine and the Faculty of Medicine of the University of Buenos Aires under the auspices of the British Council of London. He won the Nobel Prize in medicine in 1932.

**Conference on Tuberculosis**—The first Peruvian Conference on tuberculosis will be held in Lima, October 12-17. It was organized by the Sociedad Peruana de Tisiología and will be held under the auspices of the government of Peru. Drs Max Espinoza Galarza and Juan A Werner are the president and general secretary of the committee of organization respectively. There will be four different sections: medicosocial, clinical, surgical and one for presentation and discussion of free topics on tuberculosis. The subjects to be discussed include indexes of infection and morbidity and mortality from tuberculosis in Peru and involved social factors, classification of clinical forms of tuberculosis in dispensaries and nosocomia, surgery in pulmonary tuberculosis and its indications and free topics on tuberculosis. The committee of organization may be addressed at Apartado Postal Number 1699, Lima, Peru.

### LONDON

(From Our Regular Correspondent)

May 30, 1942

#### The Declining Birth Rate

The serious decline of the birth rate is causing much concern. The *Times* refers to a letter from a reader giving the depressing experience of his wife expecting her first baby in August. She spent a day in London going from shop to shop in a fruitless attempt to get articles absolutely essential for maternity and has decided that "to have a baby in this country now has become a crime." Other readers consider that the difficulty of obtaining domestic help—increased on a vast scale by the war—is responsible more than anything else for the decline of the birth rate.

Sir Leonard Hill (physiologist), director of research at the Institute of Physical Medicine, says that, as in Russia, the begetting of children should be extolled and regarded as the highest of social services. It should be made easy by free access to a maternity ward where birth is made painless and safe. In addition to family allowances, creches should be provided so that mothers can go out to work and obtain relaxation. He adds that the glands of the body exert their inexorable rule and it is the women who suffer, as every gynecologist knows, when the natural law of having children is set aside by artificial means.

The declining birth rate is also a subject in the *British Medical Journal*. There Hill points out in a communication that modern science has reduced the death rate and at the same time introduced means of preventing birth. The result is a great increase in the number of the middle aged and old and a precipitous fall in the number of young persons—a new and artificial condition and one which does not exist in Japan, Germany or Italy. The fall of France he attributes partly to the fall in the number of young persons.

In an editorial the *British Medical Journal* gives the main statistics of the decline of the birth rate. In the period 1870-1900 it fell by 20 per cent. In the period since 1900 the fall has been accelerated and has reached 50 per cent. The birth rate for married women aged 15-45 in the triennial period 1930-1932 was less than half that in 1870-1872. The decline did not affect all classes alike and was much greater among the affluent than among the others. In 1911 one fourth of the wives contributed over one half of the child population and at the other end of the scale one third of the wives had only one twentieth of the children.

A fall in the death rate was concurrent with the fall in the birth rate. In the decennium 1861-1870 the death rate was 22.5 and the birth rate 35.2 per thousand, in the period 1921-1931 the rates had fallen respectively to 12.1 and 18.3. The result was that at first the growth of population was not materially changed. The decennial rate of increase of population varied from 11 to 14 per cent during the period 1871-1911, but it fell to 4.93 in 1921 and 5.52 in 1931. The changes in the birth rates have altered the age constitution of the population, increasing the proportion of the aged. The percentage aged 60 and over increased from 7.42 in 1861 to 11.56 in 1931.

In the House of Commons the minister of health was asked whether it was the intention of the government to encourage an increase of the birth rate. He replied that it had been the policy of successive governments, in fields much wider than his department, to influence the national life and economy in favor of families with children. Examples were the income tax allowances for children, the arrangements for the care of mothers and young children, the provision of free education

and of school meals and school medical services, and the preference given to large families in the selection of tenants of municipal houses. This policy had been extended by many war measures, such as increased allowances for children under the unemployment insurance and assistance schemes for children of members of the fighting forces, subventions toward the cost of bread and other staple foods, the extension of the school meal service and the provision on an increasing scale of cheap or free milk and other protective foods for expectant mothers and young children. Moreover, children's clothes have been excluded from the war purchase tax. These measures carry a very substantial relief from the financial burden of parentage.

#### Enemas of Sea Water Unsuccessful for Quenching Thirst

In a previous letter was reported the discussion in the *Times* and *British Medical Journal* of the suggestion, made some years ago, that enemas of sea water might be used for the quenching of thirst of the survivors from shipwreck crowded in lifeboat when drinking water has given out. On theoretical grounds a pharmacologist thought that the body would lose water in the transaction. The highest concentration of sodium chloride in the urine after taking large quantities of concentrated solution by mouth is 16 per cent, while sea water contains 27 per cent. This reasoning has now been justified by a practical test. In the *South African Medical Journal* (March 28, p. 113) Fox, Altmann and Kondi report from the South African Institute for Medical Research experiments on 6 healthy persons who were deprived of all fluid for about eighty hours, 3 receiving rectal injections of sea water and 3 acting as controls. The only food was dry ship biscuits, which were hardly taken at all after the first day, and lime flavored sweets, called "life savers." A daily total quantity of 1,500 cc of sea water in five or six doses was aimed at, but this quantity could not be retained. The maximum in the first twenty-four hours was 1,300 cc, and 2 of the 3 persons actually returned from 150 to 200 cc more fluid from the rectum than they received. Thereafter four daily doses of 200 cc were given, but even this quantity was retained only by the greatest effort.

There was no difference clinically between the two groups. All had decreasing pulse rates and a tendency to lowered blood pressure. The signs of dehydration (dry mouth, sunken eyes, inelastic skin) were equal in the two groups, as was the continuation of thirst. All said that sucking the sweets helped to overcome the dryness of the mouth and so alleviated the thirst. On the last day of the experiment, 2 of those taking the sea water complained of severe lumbar pains. The hemoconcentration produced by dehydration was practically the same in the two groups, but those receiving sea water had higher values for blood chlorides, also their urinary output, urinary concentration and total excretion of chlorides were much the higher. There was evidently enforced tissue dehydration, which was confirmed by an average loss in weight per person of 10 pounds as against 6 pounds in the controls. The conclusion was that even if water is absorbed, is of little or no value in maintaining water balance and possibly is harmful.

#### The Casualties of German Reprisal Raids

The reprisal raids by Germany for the British bombing of munition factories took the form of bombing the principal residential and historic cities of Exeter, Bath, Norwich and London. This was responsible for most of the air raid casualties in April, which were as follows: killed (or missing) 938, injured and detained in hospitals 993, killed or missing and believed killed include 359 men, 440 women, 122 children and 11 unclassified. The effect of the reprisal raids in sending up the casualties is shown by the figures for the preceding three months. The number of casualties from air raids was 155, being 112 in January, 22 in February

21 in March. One extraordinary result is that some young children found wandering in the ruins of these towns may never know their true names, as their parents could not be found. They may have been blown to pieces or their bodies so damaged that they cannot be identified.

## RIO DE JANEIRO

(From Our Regular Correspondent)

June 10, 1942

### Communicable Diseases in Rio de Janeiro

Dr I P Fontenelle, former commissioner of health for Rio de Janeiro, has published a monograph entitled "The Incidence of Communicable Diseases in Rio de Janeiro," in which he studied with full details the prevalence of various communicable diseases in the city and their trend since the beginning of this century. To describe the incidence of these diseases the author has mainly used mortality figures, since reporting by the physicians is still comparatively undeveloped. To furnish a picture of the present prevalence of communicable diseases, Dr Fontenelle used the 1941 data, because that year has been practically "normal" except for diphtheria, of which a medium sized outbreak has been registered, with an increase of about 39 per cent of deaths from that cause. The 1940 mortality data for the United States have been used as a standard. The figures demonstrate that the crude death rate for the communicable diseases as a whole is seven times as large in Rio de Janeiro as in the United States (556.1 against 79.6 per hundred thousand of population). For the most important diseases the ratios between the mortality in Rio de Janeiro and in the United States are: mumps 10 (0.1 to 0.1 per hundred thousand), chickenpox 20 (0.2 to 0.1 per hundred thousand), epidemic meningitis 22 (1.1 to 0.5), influenza 39 (60.6 to 15.4), typhoid 65 (7.2 to 1.1), tuberculosis of all forms 69 (317.5 to 45.8), erysipelas 70 (3.5 to 0.5), whooping cough 71 (15.6 to 2.2), syphilis 71 (57.1 to 8.0), diphtheria 96 (10.6 to 1.1), rabies 100 (0.3 to 0.03), malaria 114 (12.5 to 1.1), dysentery 157 (14.1 to 0.9), smallpox 200 (0.2 to 0.01) and measles 238 (11.9 to 0.5). Leprosy presented the death rate of 3.6 per hundred thousand in Rio de Janeiro and 0.0 in the United States. The only diseases presenting higher death rates in the United States than in Rio de Janeiro were scarlet fever (0.8 in the United States against 0.2 in Rio de Janeiro), epidemic encephalitis (0.6 against 0.5), poliomyelitis (0.8 against 0.05) and undulant fever (0.1 against 0.05). From tularemia and from typhus fever the death rate was 0.1 and 0.2 respectively against 0.0 from both diseases in Rio de Janeiro.

That the number of reported cases of communicable diseases is still rather low in Rio de Janeiro is shown by the figures for the ratio between cases and deaths in 1941: 10 for epidemic encephalitis for rabies and for influenza, 13 for tuberculosis (all forms), 14 for dysentery (one fourth of the cases are of amebic dysentery), 16 for malaria, 17 for syphilis, 21 for epidemic meningitis, 45 for typhoid and for leprosy, 52 for measles, 100 for scarlet fever, 126 for diphtheria, 137 for whooping cough, 211 for mumps, 270 for poliomyelitis, 315 for smallpox and 1907 for chickenpox. For all the communicable diseases together the ratio is only 19. For the same diseases the ratios between the figures for cases and deaths in the United States as a whole in 1940 and Rio de Janeiro in 1941 are: rabies 10 (10 to 10), epidemic meningitis 13 (27 to 21), typhoid 15 (68 to 45), tuberculosis 15 (19 to 13), whooping cough 47 (639 to 137), smallpox 59 (1863 to 315), epidemic encephalitis 125 (25 to 0.2), chickenpox 166 (3172 to 1907), dysentery 169 (236 to 14), scarlet fever 238 (2384 to 100), influenza 246 (246 to 10), syphilis 255 (434 to 17), malaria 351 (561 to 16), mumps 607 (1,2674 to 211) and measles 822 (4275 to 52). The only diseases presenting higher ratios of cases/deaths in Rio de Janeiro than in the United

States were diphtheria (106 in the United States against 126 in Rio de Janeiro) and epidemic poliomyelitis (98 to 270). For all the communicable diseases together the ratio is 20.5 in the United States against 19 in Rio de Janeiro. According to Dr Fontenelle, diphtheria and typhoid are somewhat milder in Rio de Janeiro than in the United States, so much so that instead of 10 and 15 cases respectively to one death, as the American Public Health Association standards put it, 15 and 25 should be known in Rio.

The second part of Dr Fontenelle's monograph relates to the trend of communicable diseases during the forty year period included in the study (1902-1941). As in the first part, the mortality rates for the whole United States, taken from *Public Health Reports*, are used as a standard for comparison. During the eight five year periods the death rate from all causes has declined in the United States from the mean annual value of 16.5 per thousand of population, in 1902-1906 to 10.6 in 1937-1941, whereas in Rio de Janeiro the mortality similarly decreased from 250 to 176 or an average decline of 10 per cent a year, for the former case against 0.9 for the latter. The mortality from all the communicable diseases together decreased in the United States from the mean annual death rate of 4.3 per thousand in 1902-1906 to 0.8 per thousand in 1937-1941, against 9.5 in 1902-1906 to 5.4 in 1937-1941 for Rio de Janeiro. This corresponds to an average decline of 1.2 per cent a year against 2.3 per cent a year for the United States, thus meaning that the average reduction of the mortality for all the communicable diseases together in Rio de Janeiro during the last forty years has been practically only one half the decline registered for the same diseases in the United States. For Rio de Janeiro this long period of forty years may be roughly divided into two about equal parts, the first one beginning with Oswaldo Cruz, the successful organizer of the fight against the tropical scourges represented mainly by yellow fever, plague, malaria and smallpox of the worst character, which have been eradicated from the city, and the second part beginning with Carlos Chagas, who introduced modern public health in Brazil. In this second period a campaign was begun against a group of diseases comparable to the ones that are at present being fought in Europe and in the United States. Besides the successful campaign won against the tropical scourges that were considered a 'shame' for the beautiful capital city of Brazil, relatively little has been accomplished against tuberculosis, typhoid, diphtheria, dysentery, measles, whooping cough and syphilis.

Typhoid has had a very slow decline in Rio de Janeiro from the mean annual death rate of 13.9 per hundred thousand of population in 1902-1906 (31.0 in the United States as a whole) to 7.1 in 1937-1941 (1.3 in the United States). Large epidemics of typhoid are not common in the city, and since 1926 the annual death rate from this disease has been always under 10 per hundred thousand. The water supply is adequately protected, but, as one fifth of the population in the suburbs lives in unsewered districts, small local outbreaks occur almost every year, through the pollution of the water supply from ditches conveying the effluents or the latrines. The city administration now has a program to extend the sewerage system. Diphtheria has had a slight and continuous increase from 5.5 per hundred thousand in 1902-1906 (34.8 in the United States) to 8.4 in 1937-1941 (1.5 in the United States). A project of toxoid immunization, carried out during Dr Fontenelle's administration of the Health Department (1935-1939) was discontinued in 1940. A new drive of immunization is just beginning. The death rate from tuberculosis is very high (316 per hundred thousand in 1941) and the mortality has practically had no decline (415 per hundred thousand in 1902-1906 and 323 in 1937-1941). Dysentery, whooping cough and measles have had only a small reduction and still present high mortality rates (14.4, 15.4 and 14.6 respectively).

## Deaths

**John Oliver McReynolds** ♂ Vice President of the American Medical Association in 1926-1927 and chairman of the Section on Ophthalmology in 1922-1923, died July 7 at his home in Dallas, Texas, of carcinoma of the stomach. Dr. McReynolds was born in Elkton, Ky., July 23, 1865. He graduated at the College of Physicians and Surgeons, Baltimore, in 1891, receiving the highest honors in a class of 116. After serving as first assistant resident physician at the Baltimore City Hospital, Dr. McReynolds entered private practice in Dallas in 1892. He once served as dean and professor of ophthalmology at the Southern Methodist University Medical Department, Dallas, and early in his career was professor of mathematics and natural sciences at Burritt College in Tennessee. At one time he also taught mathematics and astronomy at the Dallas High School. He was a member of the American Academy of Ophthalmology and Otolaryngology, American Laryngological and Otolological Society and the Association for Research in Ophthalmology, Inc., and honorary member of the Ophthalmological Society of Mexico and of the National Academy of Medicine of Mexico. Dr. McReynolds was a fellow and member of the board of governors of the American College of Surgeons and had been a specialist certified by the American Board of Ophthalmology and the American Board of Otolaryngology. At one time he had been

JOHN O. McREYNOLDS, M.D.  
1865-1942

president of the Pan American Medical Association and of its fourth congress, of the Flight Surgeons Association of the United States and of the Air Service Medical Association of the United States, of which he was also a founder, of the Texas State Medical Association and of the Dallas County Medical Association. He represented America at the Oxford Congress of Ophthalmology and Texas and Mexico at the International Congress of Ophthalmology in Amsterdam.

Dr. McReynolds served on the staffs of St. Paul's Hospital and Clinic, Methodist Hospital and the Shrine Hospital for Crippled Children, the Gulf, Colorado and Santa Fe Railroad, Chicago, Rock Island and Pacific Railway, and the Missouri, Kansas and Texas Railway. In 1934 he received the Order of Carlos Finlay of the Republic of Cuba and the Venezuela medal of honor "as a mark of the gratitude of the people of Venezuela" in recognition of his services to the cause of education.

During World War I Dr. McReynolds was a major in the medical corps of the U. S. Army and consultant flight surgeon for the Southwestern Flying Fields. He established an aviation research laboratory at St. Paul's Hospital and was director of the research laboratories at the Aviation Concentration Camp at Camp Dick.

Dr. McReynolds had recently prepared an educational series on the eye for *Hygeia*. He was devoted to his specialty and to the advancement of research. His friendships throughout the world were legion.

**Frederic Moses Stanton** ♂ Columbus, Ohio, Ohio State University College of Medicine, Columbus, 1915, chemist, U. S. Geological Survey, from 1904 to 1907, chemist in charge of the U. S. Bureau of Mines Laboratory from 1907 to 1909, assistant professor of chemistry, Starling-Ohio Medical College, from 1911 to 1914, associate professor of chemistry at his alma mater, 1915-1916, for many years on the staffs of the Grant, St. Clair and St. Ann's hospitals, aged 62, died, May 22, of acute myocardial infarction.

**Ernest Willoughby Carpenter** ♂ Greenville, S. C., Medical College of the State of South Carolina, Charleston, 1895, member of the American Academy of Ophthalmology and Otolaryngology, fellow of the American College of Surgeons,

specialist certified by the American Board of Ophthalmology, member of the Selective Service System, for many years on the staffs of the Shriners' Hospital for Crippled Children, St. Francis Hospital and the Greenville General Hospital, aged 67, died, May 29.

**John Wellington Sansom** ♂ Sparkill, N. Y., University of Vermont College of Medicine, Burlington, 1895, member of the American Society of Anesthetists, Inc., since 1937 health officer of the town of Orangetown, aged 72, on the staffs of the Rockland State Hospital, Orangeburg, Summit Park Sanatorium, Pomona, New York State Reconstruction Home, West Haverstraw, and the Nyaack (N. Y.) Hospital, where he died, May 11.

**Alfred Richards** ♂ Washington, D. C., Georgetown University School of Medicine, Washington, 1897, formerly assistant demonstrator of anatomy at his alma mater, veteran of the Spanish-American War, medical officer for the draft board during World War I, formerly surgeon for the police and fire departments, aged 69, died, May 26, in the Providence Hospital of chronic bronchiectasis and congestive heart disease.

**Nathan Norman Smiler**, Washington, D. C., George Washington University School of Medicine, Washington, 1919, member of the Medical Society of the District of Columbia, clinical instructor of surgery at his alma mater, fellow of the American College of Surgeons, assistant surgeon, Central Dispensary and Emergency Hospital, aged 53, died, May 5, of coronary thrombosis and renal calculi.

**George A. Tuttle**, New York, College of Physicians and Surgeons, medical department of Columbia College, New York, 1886, formerly assistant professor of clinical medicine at his alma mater, for many years attending physician to the Presbyterian Hospital, aged 82, died, May 10, in the Middlesex Hospital, Middletown, Conn., of coronary thrombosis and carcinoma of the bladder.

**Robert Theodore Tapert** ♂ Detroit, Detroit College of Medicine, 1901, formerly city physician and assistant police surgeon, chief of staff of the Evangelical Deaconess Hospital from 1918 to 1940, for many years on the staff of the Providence Hospital, formerly pension examiner for the First Congressional District, aged 64, died, May 7, of adenocarcinoma of the right kidney.

**Harley James Gunderson** ♂ Beverly Hills, Calif., Northwestern University Medical School, Chicago, 1911, fellow of the American College of Surgeons, surgeon, California, Queen of Angels, Cedars of Lebanon and Hollywood hospitals, Los Angeles, aged 53, died, May 27, in Los Angeles of pulmonary tuberculosis.

**Theodore Sallee**, Covington, Ky., Kentucky University Medical Department, Louisville, 1906, formerly health officer of Covington, served as a lieutenant in the medical corps of the U. S. Army during World War I, aged 73, on the staff of St. Elizabeth Hospital, where he died, May 7, of lobar pneumonia.

**James Pogue Gibson**, Lakewood, Ohio, St. Louis College of Physicians and Surgeons, 1900, served as a first lieutenant in the medical corps of the U. S. Army during World War I, aged 65, died, May 23, in the Lakewood Hospital of benign prostatic hypertrophy, Parkinson's disease and arteriosclerosis.

**Charles Harvey Hay**, Lakewood, Ohio, Western Reserve University Medical Department, Cleveland, 1901, fellow of the American College of Surgeons, specialist certified by the American Board of Otolaryngology, formerly on the staff of the Lutheran Hospital, aged 69, died, May 15, of carcinoma.

**Joseph W. Helz**, Fond du Lac, Wis., College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1903, member of the State Medical Society of Wisconsin, county physician, aged 63, died, May 5, of coronary occlusion, arteriosclerosis and hypertension.

**Oliver Howard Campbell** ♂ St. Louis, Missouri Medical College, St. Louis, 1899, a lieutenant colonel in the medical corps of the U. S. Army during World War I and later a colonel in the reserve corps, aged 70, died, May 27, in the Missouri Baptist Hospital of carcinoma.

**Justin Limbaugh Conrad** ♂ Jamestown, N. D., Northwestern University Medical School, Chicago, 1929, president of the Stutsman County Medical Society, aged 42, died, May 28, at Rochester, Minn., of cerebrospinal meningitis and osteomyelitis of the maxilla.

**Marion N. Thayer**, Linton, Ind., Rush Medical College, Chicago, 1902, served as a captain in the medical corps of the U. S. Army during World War I, aged 66, died, May 1, in the Veterans Administration Facility, Marion, of cerebral hemorrhage and hypertension.

William A Weaver, Philadelphia Hahnemann Medical College and Hospital of Philadelphia 1896, aged 71, on the courtesy staff of the Hahnemann Hospital, where he died, May 18, of hypertrophy of the prostate and calculus of the bladder

Frederick N Brown, Providence, R I, Dartmouth Medical School, Hanover, N H, 1899, member of the Rhode Island Medical Society, editor of the *Rhode Island Medical Journal* from 1920 until 1936, aged 79, died, May 23, of arteriosclerosis

Ira Bratton Whitehead, Pittsburgh, Jefferson Medical College of Philadelphia, 1903, member of the Medical Society of the State of Pennsylvania, aged 68 died, May 20 in St Joseph's Hospital of coronary occlusion and arteriosclerosis

Ross Foster Wolever @ Fulton, N Y, Syracuse University College of Medicine 1919 past president of the Oswego County Medical Society, roentgenologist, Lee Memorial Hospital, aged 49 died, May 4, of hypertensive heart disease

Charles Benjamin Frothingham, Lynn, Mass, Dartmouth Medical School Hanover N H, 1892, for many years city physician and member of the school committee, formerly state senator, aged 84 died, May 28 of coronary thrombosis

Thomas K Cassidy, Cheyenne, Wyo, Western Reserve University Medical Department, Cleveland, 1897, collector of internal revenue for Wyoming, aged 68, died, May 28 of cerebral hemorrhage, hypertension and arteriosclerosis

Albert Harry Fagerstrom, Clearwater, Fla, Milwaukee Medical College, 1912, formerly on the staffs of the Swedish and Asbury hospitals, Minneapolis, aged 56 died, May 1 in the Morton Plant Hospital of diabetes mellitus

Yacob Kevork Kelleyan, Los Angeles American University of Beirut School of Medicine Syria, 1905, member of the California Medical Association aged 59, died, April 2, of coronary thrombosis and arteriosclerosis

Walter Reid George, Indianapolis, Medical College of Indiana, Indianapolis, 1895 at one time health commissioner of Marion County, aged 70, died, May 1, in the Methodist Hospital of hypertrophy of the prostate

Henry Bronson Hollen, Los Angeles, Chicago Homeopathic Medical College, 1902, Hahnemann Medical College and Hospital, Chicago, 1905, aged 64, died April 4, of arteriosclerosis and coronary occlusion

Highland Z Dean @ Prosser Wash Lincoln Medical College of Cotner University, Lincoln, Neb, 1902, formerly health officer and coroner of Kittitas County, aged 70, died May 14 of coronary thrombosis

Alexander J Williams, Racine Wis, Rush Medical College, Chicago 1900, member of the State Medical Society of Wisconsin, formerly health officer of Racine, aged 68, died, May 17, of chronic nephritis

Joseph Charles Gallagher, Rossford Ohio, Washington University School of Medicine St Louis, 1901, member of the Ohio State Medical Association, aged 62, died May 3, of coronary thrombosis

Richard Beason Short, Bedford, Ind, Kentucky School of Medicine, Louisville, 1891 University and Bellevue Hospital Medical College New York, 1899 aged 75 died May 21 of cerebral hemorrhage

Lewis McPhee Gibson, Asbury Park N J College of Physicians and Surgeons, medical department of Columbia College, New York, 1889, aged 76 died, May 31 of carcinoma of the stomach

Elmer Emanuel Behler, Germansville Pa, Medico-Chirurgical College of Philadelphia 1907, aged 57 died, May 26 in the Sacred Heart Hospital, Allentown, of coronary thrombosis

James William John, Pine Bluff, Ark Memphis (Tenn) Hospital Medical College 1896 member of the Arkansas Medical Society, aged 74 died May 2, of carcinoma of the bladder

Robert John Hall, Wheatley, Ark (licensed in Arkansas in 1907) mayor of Wheatley, aged 56 died May 8, in the Baptist Memorial Hospital, Memphis, Tenn of gangrene of the lungs

Spencer B Dykes, Esbon Kan, Memphis (Tenn) Hospital Medical College 1902, member of the Kansas Medical Society aged 71 died March 10, in Concordia of nephritis

Andrew Russell Davis, Moundville Ala Southern Medical College Atlanta Ga 1890 aged 85 died May 30 in a hospital at Tuscaloosa of chronic glomerular nephritis

William Saunders Baldwin, Dallas, Texas, Kentucky School of Medicine, Louisville, 1892, aged 78, died, May 31, in the Baylor Hospital of pneumonia and heart disease

Frederick Voss Mohn, Los Angeles, University of Minnesota College of Medicine and Surgery, Minneapolis, 1892, aged 85, died, April 15, of carcinoma of the prostate

Arthur Lewylen Damon @ North Wilbraham, Mass, University of Vermont College of Medicine, Burlington, 1890 aged 74, died, April 30, of cerebral thrombosis

Robert M White, Freeport, Ill, College of Medicine and Surgery (Physio Medical) Chicago, 1906, aged 61, died, May 12, of carcinoma of the pancreas and liver

Edward James Ross, Cincinnati, Meharry Medical College, Nashville, Tenn, 1921, aged 45, died, May 11, of acute coronary thrombosis and chronic cholecystitis

Wilbur S Reynolds, Virginia, Minn (licensed in Minnesota in 1883), aged 84, died, May 6, of arteriosclerosis, cerebral hemorrhage and bronchopneumonia

Elijah Wootton White @ Poolesville, Md, University of Maryland School of Medicine, Baltimore, 1906, aged 60, died, May 29, of coronary occlusion

Valentine Mott Pierce, Pasadena, Calif, University of Buffalo School of Medicine, 1891, aged 76 died, May 26, of myocarditis and hemiplegia

George H Williamson, Warren Pa Cleveland University of Medicine and Surgery, 1897, aged 75, died, May 24, of carcinoma of the stomach

John Burrows Atwood, Long Beach, Calif Rush Medical College, Chicago, 1891 aged 77, died, April 24 of subacute bacterial endocarditis

Angus James Fraser, Winnipeg, Man Canada Manitoba Medical College, Winnipeg, 1900 aged 70, died May 23 of coronary thrombosis

John Ross Swartz, Harrisburg Pa, Hahnemann Medical College of Philadelphia 1879, aged 85, died, May 3, of congestive heart disease

Arthur Carr Roll, Columbus Ohio, Pulte Medical College, Cincinnati, 1889, aged 74, died, May 10, of cerebral hemorrhage and arteriosclerosis

Milo George Miller, Atlantic City, N J, University of Pennsylvania Department of Medicine, Philadelphia, 1888, aged 80 died May 23

Thomas Cowger, Danville, Ark (licensed in Arkansas in 1903), aged 66, died, May 7, in St Mary's Hospital Russellville

Edward Oscar Thorson @ Luverne Minn, Bennett Medical College Chicago 1906 aged 67, died, May 27, of cerebral hemorrhage

Maitland Charles Bennett, Washington, D C, Howard University College of Medicine Washington, 1893, aged 79, died, May 8

Curtis A Boorman, St Petersburg, Fla, Rush Medical College, Chicago, 1887 aged 79 died in May of carcinoma of the bladder

Raymond Malcolm Carmichael @ Maysville, Ky University of Cincinnati College of Medicine, 1936, aged 33 died May 27

James Wilson Norton, Walland Tenn University of Tennessee Medical Department, Nashville 1892, aged 78, died, May 31

Ignazio Michele Cangialosi, Brooklyn, Eclectic Medical College of the City of New York 1910, aged 63 died, May 29

Frederick Smith Waterbury, Huntsville, Ohio Hospital College of Medicine, Louisville Ky, 1896, aged 77 died, May 9

Maurice Weinrobe, Chicago, Rush Medical College Chicago 1928, aged 40 died May 3, of acute coronary thrombosis

Francis L Smith, Lucas Kan Ensworth Medical College St Joseph Mo 1900 aged 68, died May 9, of heart disease

Henry C Childs @ Tulsa Okla College of Physicians and Surgeons Dallas Texas 1905, aged 64 died, May 7

Frederick Douglass, Tuskegee, Ala, Meharry Medical College Nashville Tenn, 1939 aged 28, died, April 9

David Newton E Campbell, Baltimore Leonard Medical School Raleigh N C, 1897, aged 71, died, April 27

David Roswell Rothrock, Milton Pa, Baltimore University School of Medicine 1885 aged 80 died May 4

Thomas Lynch, Waldorf Md College of Physicians and Surgeons Baltimore 1881 aged 83 died May 20

## Bureau of Investigation

### THE ELGA "BUST DEVELOPER" FAKE

#### California and Federal Investigations Result in Promoter Being Placed on Probation

As notorious in the quackery field as the fake "fat cures," though not so numerous, have been the fraudulent "bust developers" that have swindled thousands of dollars out of credulous women. Time after time the Post Office Department has banned some of these vicious "developers" from the mails. Invariably others have sprung up to take their places and to make juicy profits for their promoters.

The Food and Drug Administration, aided by state authorities and local interests, brought an end to the business conducted at San Francisco under the names "Elga Laboratories" and "Elga Studios" by a Myrtle E. Edwards, also known as Mrs. Edwards, Myrtle E. Bander and Myrtle Tarnaskey. The information that follows is taken from documents issued by federal and California state authorities, and from the records of the Bureau of Investigation of the American Medical Association.

At one time in her shadowy past Mrs. Edwards had been arrested in Salt Lake City for some reason not now clear and later (1918) in St. Louis, under the Tarnaskey name, for passing worthless checks. She appears to have gone into the "bust developing" game in San Francisco considerably later. Typical of her advertising blurbs was the following, which was said to have appeared weekly in a San Francisco paper:

#### YOUTH AND BEAUTY

and feminine loveliness is expressed in a softly curved body, especially in high, firm, rounded breasts. If yours sag or are immature, Dr. Thompson's remarkable food will bring you the loveliness you desire. Home Treatment Guaranteed. Not a cream or a massage. No drugs or narcotics. Free Private consultation. No embarrassment.

Taking the initiative in looking into this fraud, apparently, was the California State Board of Medical Examiners, which began an investigation in 1938, but because of the intimate nature of the treatment and the embarrassment that would be caused Mrs. Edwards' victims in testifying against her, it seemed impossible at that time to obtain definite evidence of a criminal nature against her. Hence the board could only warn her against her type of advertising and any attempt to prescribe for or treat bust deficiencies.

In July 1940 a woman investigator for the same board, accompanied by one representing the San Francisco Better Business Bureau as a witness, went to Mrs. Edwards' office for treatment. Mrs. Edwards examined and measured the customer and, noting her rather flat contour, promised her that the "Elga Bust Developer" would give her a larger, well formed, firm bust in a short time. She added the "guaranty" that twelve bottles of the "wonder" elixir would produce completely satisfactory results, and charged her \$6 for a 6 ounce bottle, which, contrary to state and federal food and drugs acts, bore no label.

On the second visit the investigator was told that she also needed hormone tablets for certain gland deficiencies and purchased fifty 5 grain tablets taken from a bottle labeled "Thyroid and Ovarian Substance" for \$2.50. These were to be used along with the Elga Bust Developer to expedite the promised "development." Since Mrs. Edwards was unable to give directions for taking the tablets, she directed the customer to get these instructions from an Arthur R. Gould, M.D., who gave them over the telephone without even seeing the patient. Dr. Gould's name and that of the Elga Laboratories also appeared on the back of a special diet list that Mrs. Edwards supplied to the customer, together with a laxative nostrum, "Caroid and Bile Salts."

The Elga Bust Developer, a liquid prepared and bottled by Mrs. Edwards in her kitchen, was found on analysis to be only a sugary syrup flavored with sassafras and colored with a coal tar dye (amaranth). Although the mixture was found to be worthless—and was presumably harmless—an Oregon girl later claimed that it had caused her to lose weight and impaired her health.

Besides selling the "developer" and the Thyroid and Ovarian Tablets, Mrs. Edwards put out a "hair tonic" and a nostrum called "Sobr-Quick" for sobering up drunks.

On Aug. 1, 1940 the California Board of Medical Examiners had Mrs. Edwards arrested on the charge of practicing medicine without a license. On August 5 she pleaded not guilty and demanded a jury trial. A judge in the municipal court set bail at \$500 cash and ordered her to cease operations until the case should be concluded. Mrs. Edwards, however, ignored this order, continued to promote her swindle, and on September 7 was again arrested. Once more she pleaded not guilty, demanded a jury trial and was released on bail, this time \$1,000. After many continuances she withdrew her request for a jury trial, and the case was heard on October 9. Mrs. Edwards was found guilty of practicing medicine without a license on two charges and the case was continued, pending the outcome of two federal cases against her, which will be mentioned later.

Finally, on Jan. 28, 1941 the municipal judge sentenced her to six months in the county jail on each of the two charges. In the first case the jail sentence was suspended on condition that Mrs. Edwards make full restitution, totaling \$402, to the thirteen victims who testified against her. This was to be done by March 15, or her jail sentence would take effect. On the second charge Mrs. Edwards was given a suspended sentence of six months in the county jail and placed on probation for four years, on condition that she would not attempt to practice medicine or engage in any similar activities.

The state's investigation of this brazen piece of quackery developed some interesting revelations. It brought out that Mrs. Edwards had done "a tremendous mail order business

both in and out of California" and that "her books showed that her income from the sale of said developer ran into thousands of dollars" at the time of the defendant's arrest. Her books listed more than 700 patients, who were either taking the "developer" at that time or had taken it in recent months. Of some fifty of the local victims selected at random from Mrs. Edwards' records and interviewed for their opinions, not one claimed to have received the slightest degree of bust development, though some had taken as many as fifty-two bottles of the "Elixir."

From the first, Mrs. Edwards had advertised "satisfactory results guaranteed or money back after nine bottles." When the "treatment" failed to fulfil her claims she increased the number of bottles covered by the "guaranty" to eighteen and then to twenty-four. When discouraged victims decided to discontinue, Mrs. Edwards sent them fraudulent testimonials and "come-on" letters to entice them to continue with another six or twelve bottles at an additional cost of \$12 to \$24. Should a victim demand the "guaranteed" refund she would receive the insulting reply that she did not "live right." It is said that in one instance Mrs. Edwards threatened to have a "patient" arrested if she attempted to take legal action to get her money back.

In her advertising Mrs. Edwards exploited the name "George F. Thompson, M.D." Investigation revealed that no physician of that name had ever been connected with the business. When questioned about this, Mrs. Edwards declared that "Dr. Thompson" was her uncle, had practiced in Chicago and had given her the "formula" for the "developer" prior to his death some thirty years before. This claim, too, was obviously false, for she had given her age as only 41 at the time of her arrest. Still later she stated that George F. Thompson was not a physician but a book salesman and her former husband.

The "testimonials" exploited by Mrs. Edwards were found to be fraudulently used, since their signers admitted that they had written them on commencing the treatment after a letter from Mrs. Edwards that they would obtain the desired results and that she would not show these documents to prospective patients until after the writers' "development" was complete. Instead, it was revealed, they were unable to get their money back and the fact was that Mrs. Edwards had had the "testimonials" photostated and used them as "come-on" bait. Further investigation shown that in 1 case Mrs. Edwards' secretary, having become discouraged over the treatment, sent her a letter

tion of herself (the writer) as a "patient" which corresponded to the victim's own condition, and influenced her to take an additional twenty-one bottles, making a total of thirty-nine that she bought. Still getting no results, she was eventually unable to obtain the "guaranteed refund of her money."

Victims of the scheme were asked to pose in the nude for photographs taken at angles designed to show a flat bust or an increased size, as the case might be. In some instances a thin brassiere was employed to give the illusion of a larger bust. These photographs were shown to prospective suckers as "before and after" bait. Subsequently Mrs. Edwards admitted that for some of the photographs she had hired professional models who had never used her "developer."

Another element of fraud in the scheme was Mrs. Edwards' claim to have the approval of the California State Board of Pharmacy, the State Food and Drug Department, the Federal Food and Drug Administration and Dr. J. C. Geiger, Director of the San Francisco Department of Public Health. On May 17, 1938 Dr. Geiger notified Mrs. Edwards by letter to discontinue the lying claim that either he or his department approved of her fake treatment.

So much for Mrs. Edwards' experiences with the California authorities. Not daunted by these difficulties, she also shipped a consignment of her product to a distant state and encountered another law enforcement agency, the Federal Food and Drug Administration. This agency, far from giving its approval to the scheme as Mrs. Edwards represented, arrested her on Sept. 19, 1940 on two counts of violating the national Food, Drug and Cosmetic Act. She was charged with fraudulently representing on the labels that her "developer" was a food. As with her case in the municipal court she pleaded not guilty and asked for a jury trial. After obtaining several delays she and her attorney finally appeared before Judge Michael J. Roche in the district federal court on Jan. 21, 1941, when she withdrew her former plea of not guilty and pleaded guilty to both counts. When her attorney made a motion for probation the court continued the case to February 4 and referred it to the Probation Officer for a report. On February 4 Mrs. Edwards was placed on probation for four years, as had been done in the municipal court case. Reports of the federal court actions were published under *Food Notice of Judgment No. 2096 February 1942*, and *Drugs and Devices Notice of Judgment No. 370 March 1942*. At the hearing of one of these cases it was shown that Elga Bust Developer consisted essentially of invert sugar, extracts of plant drugs and a small amount of calcium phosphate, with water and red coloring—a more detailed report than that given earlier in this article.

Probation was granted to Mrs. Edwards in this government case on condition that she report to the federal probation officer once a month for four years and refrain from any violation of the law during that period; otherwise, it was provided she would again be brought before Judge Roche and given a maximum sentence of two years in a federal prison and a fine of \$2,000. At the conclusion of the case the chief investigator of this swindle for the California Board of Medical Examiners commented:

It is reasonably certain that this outfit 'is at last definitely out of the business of defrauding the public.'

As for Arthur Richard Gould, M.D., of San Francisco, it is not surprising to find that he was tied up with the Edwards scheme as he had been, in turn a disciple of the Albert Abrams and George Starr White quackeries and the promoter of various patent medicines and fad foods. As a result of his connection with the Edwards fraud the California Board of Medical Examiners on Oct. 24, 1940 found him guilty of aiding and abetting an unlicensed person in the practice of medicine and placed him on probation for three years.

The California Board of Medical Examiners acknowledged the assistance of the San Francisco Better Business Bureau in the investigation and exposure of the Edwards swindle. In view of successful prosecution of this and other bust developer frauds by various government and state agencies, it would appear that those who imagine that they can long exploit such fakeries with impunity are as obvious suckers as are the victims whom they swindle.

## MISBRANDED PRODUCTS

### Abstracts of Notices of Judgment Issued by the Food and Drug Administration of the United States Department of Agriculture

[EDITORIAL NOTE—These Notices of Judgment are issued under the Food, Drug and Cosmetic Act and in cases in which they refer to drugs and devices they are designated D D N J and foods, F N J. The abstracts that follow are given in the briefest possible form: (1) the name of the product, (2) the name of the manufacturer, shipper or consigner, (3) the composition, (4) the type of nostrum, (5) the reason for the charge of misbranding and (6) the date of issuance of the Notice of Judgment—which is considerably later than the date of the seizure of the product and somewhat later than the conclusion of the case by the Food and Drug Administration.]

**Beautysage Vibrators**—Beauty Appliance Corporation, Racine, Wis. An electric vibrator fitted with three differently shaped rubber appliances. Misbranded because the label falsely represented that the device would stimulate the blood flow, maintain the firm contours of face and figure by gentle massaging action, check the falling of dry brittle hair and stimulate new growth, would be effective treatment for pains, lumbago, fatigue, stiffness and other disorders and an aid for almost every imaginable ailment.—[D D N J F D C 199 April 1941]

**Bersted's Eskimo Vibrator**—Bersted Manufacturing Company, Folsom, Ohio. An electric vibrator fitted with several attachments. Misbranded because label falsely represented among other things that the device would enable one to vibrate one's way to health and beauty and was efficacious for obesity, insomnia, blackheads, neuralgia, nervousness, acute rheumatism, sagging muscles and lifeless skin.—[D D N J F D C 200 April 1941]

**El Aguinaldo Cuban Wonder Honey**—Cuban Health Products and Cuban Honey, Inc., Lansing, Mich. Misbranded because label bore the word "Health" and representations that carbohydrates in this form (honey) mean pep, that it contained many of the necessary salts and had been clinically tested and that such tests had been carried on in cases of bronchial asthma and bronchitis under the care of reputable physicians, that it had been found to be a desirable food supplement to a bland diet in cases of stomach ulcers and other digestive disorders, that it had been used with wonderful effects, would do everything for which it was recommended and was efficacious for local irritations of nose and throat associated with coughs, colds, asthma, bronchitis, sinus and hay fever among other things.—[D D N J F D C 204 April 1941] Another Notice of Judgment (D D N J F D C 377) involving seizures of four additional shipments of this product on misbranding charges was issued in March 1942. Examination of the article in these cases showed that it contained nothing but honey.

**Endiphrin Inhalant**—Harrower Laboratories, Inc., Glendale, Calif. Adulterated and misbranded because represented to be a 1 per cent solution of epinephrine hydrochloride, whereas its strength was only 0.67 per cent of this ingredient.—[D D N J F D C 294 November 1941]

**Gilbert Vibrator**—A. C. Gilbert Company, New Haven, Conn. An electric vibrator with three attachments consisting of a button, a rubber cup and a rubber brush. Label falsely represented that this vibrator would restore health, cleanse the pores of the skin, develop the bust, overcome thin brittle hair and do some other things.—[D D N J F D C 201 April 1941]

**No. 357 Table Type Therapeutic Lamp**—Eagle Electric Manufacturing Company, Brooklyn. Device consisted of an incandescent bulb screwed into a goose-neck table type lamp. Falsely represented as an effective treatment of abscesses, colds, backache, rheumatism, sore throat, boils, carbuncles, ulcers and some other things.—[D D N J F D C 195 April 1941]

**Thermolite Heat and Light Applicators**—H. G. McFadden & Company, Inc., New York. Device contained an incandescent electric bulb inserted into a socket equipped with a parabolic mirror reflector. Label falsely represented it as efficacious in treating such conditions as pains and colds and promoting the growth of hair.—[D D N J F D C 196 April 1941]

**Vapo Spa Vapor Bath and Vapo Spa Pine Needle Oil**—Health Glo Laboratories, Inc., New York. Composition essentially pine needle oil. Misbranded because falsely labeled as a scientific aid to slenderizing, cleansing the respiratory tracts, purifying the air and the blood and ridding the body of stiffness and soreness.—[D D N J F D C 189 April 1941]

**Varlure Heat and Light Applicator**—Varick Electric Manufacturing Company, New York. An electric lamp inserted in a socket fitted with a metal reflector. Label falsely represented the device as an effective treatment of abscesses, eczema, rheumatism, skin diseases and some other things.—[D D N J F D C 197 April 1941]

**Wonder Heat Pack**—Wonder Heat Pack Company, Chicago. Product consisted of a bag containing chemicals which would produce heat when moistened with water. Falsely labeled as an effective treatment of colds, colic, cramps, infections, neuritis, pleurisy, pneumonia and some other disorders.—[D D N J F D C 198 April 1941]

## Correspondence

### IRRADIATED ERGOSTEROL POISONING

*To the Editor*—The following letter came to me through the mail. It implies that the same precaution is unnecessary in using their preparation of activated ergosterol (Ertron) as when other sources of vitamin D are employed. This information is misleading and conducive to a false sense of security on the part of the physician employing this product.

Smith Freeman, M.D.  
302 E. Chicago Ave.  
Chicago, Ill.

June 16, 1942

Dear Dr. Freeman:

### IRRADIATED ERGOSTEROL POISONING

IN THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION May 16, 1942, Tammuly, working at Johns Hopkins University, described renal damage and other deleterious effects caused by massive doses of ultraviolet irradiated ergosterol.

For a long time many investigators have been of the opinion that such high dosages of ordinary vitamin D products are unwise.

In sharp contrast to this Ertron, which is prepared by the special Whittier process of the electrical activation of heat vaporized ergosterol in which no ultraviolet rays are used, has been subjected to very carefully controlled clinical investigations in thousands of patients for eight years without a single report of serious toxicity.

The safety and antirheumatic effectiveness of Ertron, as contrasted to the reported toxicity of various preparations of ultraviolet irradiated D, have been clearly demonstrated in many reports from university clinics, large hospitals and private practice.

It is of great importance, therefore, that physicians prescribing Ertron for arthritic patients exercise great care so that another so-called similar product is not used instead of Ertron, without the physician's knowledge.

We are enclosing a list of references which describe the safety and beneficial results obtained with Ertron in the treatment of chronic arthritis.

Very truly yours,

NUTRITION RESEARCH LABORATORIES  
S. N. BLACKBERG, M.D., PH.D.  
Medical Director

In the *American Journal of Physiology* (135:577 [Feb] 1942) McChesney and Messer showed "Ertron" to be a potent hypercalcemic principle capable of raising the serum calcium level to values far above normal, and that such doses resulted in toxic manifestations in the recipient.

SMITH FREEMAN, M.D., Chicago

### PERSONNEL FACTORS IN THE NATIONAL HEALTH SURVEY

*To the Editor*—The editorial notice (*THE JOURNAL*, May 23, p. 347) of my paper on personnel factors of the national health survey of 1935-1936 (*Am J Hyg* 34:110 [Nov] 1941) discussed this paper on the assumption that its interest lies in providing a critique of the statistics produced by that survey. For this purpose the paper provides many interesting facts, which may not, however, be taken out of the context.

I shall be glad to leave that part of the discussion of the survey to others. They should, for the sake of perspective, first recognize some well known facts of census history and also the fact that the paper is a product of the National Institute of Health. As a matter of census history it is the record of the first attempt of a statistical agency to test the ability of its staff in relation to the quality of its statistical products. The result hoped for in publishing it is an improvement in population statistics that can be brought about by studies of survey method as such. As regards content, the paper is the first published statistical study of the relation between enumerator ability, schedule make-up and the resulting reports on the population under survey. Critical studies of this problem, while necessary and

feasible, have usually been held to be inconvenient, expensive and risky to the agency. Such studies are likely to be more frequent, for variable enumerator ability and error are now accepted as costly and permanent factors in census enumerations. While attempts to solve the enumerator problem are of recent date the recognition of it is at least as old as Joab's attempt to enumerate Israel (1 Chronicles xxvii, 24). "Joab, the son of Zeruiah, began to number, but he finished not because there fell wrath for it against Israel, neither was the number put in the account of the Chronicles of King David."

Variants of this story appear frequently in later census history. The wrath figured in the debates on the English census during the eighteenth century. Pained references to enumeration error occur in the earliest U. S. census volumes. In this country the wrath has taken a political form and the U. S. marshals, enumerators and census clerks have ordinarily been blamed for the errors of record. This judgment places the responsibility where it belongs, with Joab, the statistician, the supervisor and the worker who design and operate the enumeration. The wrath, while still a threat to the success of a census, properly viewed as a disturbance of human origin. Joab reports that he finished not, estimates the error, and tries to find out why it occurred. The chronicles show the numbering and also the account of how Joab failed to finish his work.

The method outlined in the paper is intended to be more widely useful than its incidental application to illness enumeration suggests. This usefulness will probably be realized more fully in the next U. S. census. The Johns Hopkins School of Hygiene and the U. S. Census Bureau have recently endeavored in related studies of method. It is hoped that statistical agencies will continue the trend toward close scrutiny of procedure. In any case, it is no longer permissible to neglect personnel factor and schedule design problems. To do so invites the criticism that failure to correct or allow for these factors vitiates attempted comparison.

C. C. LIENAU, Baltimore

### BALDNESS AND CALCIFICATION OF THE "IVORY DOME"

*To the Editor*—Some questions concerning baldness which were raised by Dr. Ballenger's comments in *THE JOURNAL* June 27, may be answered by observations which I made while serving as technician in gross anatomy at the College of Medicine of the University of Illinois (1916-1917). I then had occasion to remove the brains of about 80 cadavers for separate use in the neurology classes and incidentally noted a remarkable obvious relation between the blood (vessel) supply to the scalp and the quantity of hair. Baldness occurred in persons in whom calcification of the skull bones apparently had not only knitted the cranial sutures but also closed or narrowed various small foramina through which blood vessels pass, most prominently in persons with a luxuriant crop of hair. These blood vessels are mainly veins which normally communicate with the diploic veins in the spongy tissue of the skull bones but which are evidently pinched off by calcification of the foramen. At various stages of this process of impairing the blood circulation to the scalp could be observed.

This, then, not only explains why baldness occurs but also why men are more likely to become bald than women. Bone growth or calcification is generally greater in men than in females. Obviously "hair tonics" or vitamins are not likely to restore a blood circulation through what has practically become "solid ivory." Moreover, one wonders whether the use of a higher calcium intake among adults may not eventually increase the incidence of baldness and the need for its remedies.

FREDERICK HOFFMAN, C.

### Hawaii January Report

The Board of Medical Examiners of the Territory of Hawaii reports the written examination for medical licensure held at Honolulu Jan 12-15, 1942. The examination covered 10 subjects and included 80 questions. An average of 75 per cent was required to pass. Six candidates were examined 4 of whom passed and 2 failed. The following schools were represented

| School                                    | PASSED | Year Grad | Number Passed |
|---|--------|-----------|---------------|
| University of Colorado School of Medicine | (1940) |           | 1             |
| Rush Medical College                      | (1940) |           | 1             |
| Jefferson Medical College of Philadelphia | (1940) |           | 1             |

### Pennsylvania January Report

The Pennsylvania State Board of Medical Education and Licensure reports the written examination for medical licensure held at Philadelphia, Jan 6-10, 1942. The examination covered 5 groups and included 50 questions. An average of 75 per cent was required to pass. Forty-one candidates were examined, 36 of whom passed and 5 failed. The following schools were represented

| School  | PASSED   | Year Grad | Number Passed |
|---|----------|-----------|---------------|
| Howard University College of Medicine   | (1940)   |           | 1             |

## Bureau of Legal Medicine and Legislation

### MEDICOLEGAL ABSTRACTS

**Optometry Practice Act Sale of Lenses Selected by Customer Not the Practice of Optometry**—The defendant corporation operated a chain of stores in which optometric goods were sold and certain optometric services were rendered. The state of Indiana, alleging that the defendant was unlawfully engaged in the practice of optometry, instituted an action to enjoin it from practicing optometry and the judgment prayed for issued. Among other things, it seemed to be a practice followed in the defendant's stores for a sales employee to hand a customer a pair of glasses for the customer to determine if satisfactory by reading magazines and signs on nearby buildings, repeating the process until a pair satisfactory to the customer was obtained. This practice, the trial court specifically held, did not constitute the practice of optometry and the practice was not embraced within the injunction issued by the trial court. The state appealed to the Supreme Court of Indiana.

The practice of optometry is defined by the optometry practice act of Indiana to be any one, or any combination of, or art, of the following acts

"(a) The examination or diagnosis of the human eye, to ascertain the presence of abnormal conditions or functions which may be diagnosed, corrected, remedied or relieved, or the application or prescription of lenses, prisms, exercises, or any physical, mechanical, physiological or psychological therapy or the employment of any means, for the purpose of detecting any diseased or pathological condition of the eye, or the effects of any diseased or pathological condition of the eye which may have any significance in a complete optometric diagnosis of the eye or its associated structures

"(b) The application use or adoption of physical anatomical, physiological psychological or any other principles through scientific professional methods and devices, to the examination of the eyes and vision, measuring their function for the purpose of determining the nature and degree of their departure from the normal, if any, and adopting optical, physiological and psychological measures and/or the furnishing or providing any prosthetic or therapeutic devices for the emendation thereof" Acts 1935 c 38, sec 4, sec 63 1004, Burns' 1933 (Supp.), Sec 13174 Baldwin's Supp 1935

The state contended that the practice referred to clearly constituted the practice of optometry as comprehended in the definition just quoted. It will be noted, said the court, that subsection a quoted has two separate parts—one pertains to the examination of the eye without designating the character of the examination, and the other pertains to the examination of the eye but designates various means, all, however, for the purpose of detecting a pathologic condition or its effect. There is no suggestion in this subsection of any remedial action. There is no mention of vision. It is the eye which is the subject of examination. The first part of subsection b likewise pertains to the examination of the eye but also includes vision—"eyes and vision." But this examination is "through scientific professional methods" and not otherwise. The purpose of the examination is to determine "the nature and degree of their departure from the normal." The latter part of subsection b is the only portion of the definition of the practice of optometry which purports to cover any remedial action and is chiefly relied on by the state as indicating that the practices of the defendant constitute the practice of optometry. The state argues that "furnishing prosthetic devices" means furnishing eyeglasses, "for the emendation thereof" means to correct, and "thereof" refers to "eyes and vision", so that the whole clause means furnishing eyeglasses to correct eyes and vision. However, we cannot accept this view. The italicized conjunctive "and" joins the two parts of subsection b so that read as a whole it pertains to the scientific professional examination of the eyes and vision and the furnishing of remedies, including lenses, for the correction of their abnormal conditions. We realize that courts sometimes substitute the disjunctive for the conjunctive where the context requires, but here we see no reason for such substitution. It seems to us that the legislature was careful with its "and" and "ors" in this whole subsection. Later the symbol "and/or" is used, which does not add certainty but does permit a choice between the conjunctions. If any such choice had

been intended where the italicized "and" appears we should expect to find the same symbol. We think the two parts were intended to be read together. Since there is no pretense that the defendant's sales are made in connection with scientific or professional examination either of the eyes or of the vision the definition does not fit the facts. Nor can we find in the opening words of the section justification for severing words and phrases from their context or rearranging them to procure a definition which, in the language of the trial judge, might have been stated, if intended, "in plain English language." Nowhere in the definition is mentioned either "sale" or "eyeglasses," two very common English words. But they were used by the legislature elsewhere in the act. Why not in this particular section defining the practice of optometry? Instead, technical words were used which may not have been understood by the legislators themselves. It ought not be necessary to use a glossary to find the meaning of a penal statute. Considering the section as a whole, concluded the court, we do not think it applies to the sale of eyeglasses as articles of merchandise, as was done by the defendant.

The state attempted to make much of the fact that employees of the defendant's store sat at a table instead of standing behind a counter and that employees handed the glasses to the customers instead of permitting the customers to select those which they would try. By this method, said the court, the lenses with which the customers can best see are probably found more quickly than by starting at one end of a row of one hundred and taking them in order. A clerk familiar with his merchandise can frequently help his customer find a fit, but the customer usually determines what suits him. The "trial and error" method depends, not on the salesman's selection, but on the customer's choice after trial. We see nothing in these facts that will convert a sale of eyeglasses into the practice of optometry.

A section of the optometry practice act, among other things, purports to make it unlawful "for any person to publish any advertisement which quotes prices on glasses." The trial court had held that this provision did not prohibit the defendant from advertising the prices of the glasses it sold, the sale of which the trial court had held did not constitute the practice of optometry. The appellate court found it necessary to advert to the title of the act to determine whether the act comprehended a prohibition of advertising prices for the sale of glasses. The title of the act read

An act to define and regulate the practice of optometry, providing for the issuance of certificates to practice providing for a state board of registration and examination and defining their duties, providing for the collection and disposition of fees and dues defining certain misdemeanors and providing penalties therefor

So far as the express language of the section, said the Supreme Court, prohibiting the publication of any advertisement quoting prices on glasses is concerned, it is not expressly limited to persons engaged in the practice of optometry. It is broad enough to apply to any person whatsoever and if taken at its face value forbids the defendant from advertising the price of the glasses which it sells. Is this subsection when construed as extensively as its language permits within the title of the act? The subject of the act, said the court, is the practice of optometry. Its object is "to define and regulate such practice." Matters that are regulatory of such practice are clearly covered by the title. To forbid price advertising by an optometrist is a regulation of his practice. But to forbid price advertising by the defendant is merely regulation of its merchandising. We do not believe the words "to define" in the title give it broad scope. They probably were inserted that there might be no questions as to the constitutionality of a statutory definition of optometry differing from the dictionary definition or common understanding of what is comprehended by the word "optometry." Truthful price advertising is a legitimate part of a lawful merchandising business. Deprivation of the right to advertise has been held to violate the due process clause of the fourteenth amendment. We cannot assume that the legislature intended to permit the sale of eyeglasses as merchandise and to deprive the dealer of one of the reasonable and lawful means of procuring purchasers for such merchandise. We are of the opinion that the title of an act should be liberally construed and the purpose of that construction is to ascertain its true meaning.

title before us is not ambiguous. The object of the act is to regulate the practice of optometry as defined in the act, and the field of regulation is circumscribed by the definition. Advertising and sale of eyeglasses as articles of merchandise are outside that field. The court accordingly concluded that the trial court in holding that advertising by the defendant was not a violation of the optometry practice act was not in error.

The decree of the trial court was affirmed—*Smith ex rel Booth v. Beck Jewelry Enterprises, Inc.* 41 N E (2d) 622 (Ind., 1942).

**Medical Practice Acts Conviction of Crime as Proof of Bad Moral Character**—The Missouri Medical Practice Act authorizes the revocation of the license of a physician "of bad moral character, or guilty of unprofessional or dishonorable conduct." Hughes, a licensed physician, was convicted in the United States courts of the crime of using the United States mails to defraud. Subsequently the Missouri Board of Health revoked Hughes' license to practice on a charge that he was a person of bad moral character and had been guilty of unprofessional and dishonorable conduct because, among other things, of his conviction of the crime referred to. The St. Louis circuit court, division no. 3, in effect ordered the board to restore Hughes' license and the state board of health appealed to the Supreme Court of Missouri, division no. 1.

The Missouri medical practice act, as stated, authorizes the revocation of the license of a physician of bad moral character or guilty of unprofessional or dishonorable conduct. The medical practice act then specifies certain acts, such as habitual drunkenness, as being dishonorable or unprofessional and dishonorable conduct. Hughes argued that the ground of revocation must be expressly specified in the statute and, since the statute did not specifically specify conviction of a crime as a ground for revocation, the board was without power to revoke his license. The fact, said the court, that the statute specifically enumerates certain acts as unprofessional and dishonorable conduct does not thereby exclude other acts indicative of unprofessional or dishonorable conduct not mentioned in the statute. Any conduct, although not specified, which by common opinion and fair judgment is determined to be unprofessional or dishonorable, may constitute grounds of revocation. The conviction of a crime may properly be considered as a ground of revocation. If found to be evidence of bad moral character, unprofessional or dishonorable conduct, it may warrant revocation of a physician's license, especially where the crime involves moral turpitude. The court accordingly held that the charge that Hughes was a person of bad moral character because of his conviction of the crime of using the mails to defraud was sufficient and proper under the statute to warrant the revocation of his license.

The fact, said the court that Hughes received a presidential pardon full and unconditional, in no way affects the situation. The pardon cannot be construed as restoring good character. Generally speaking a pardon is an act of grace which exempts the individual on which it is bestowed from the punishment the law inflicts for a crime he has committed. Whether an unconditional pardon had the effect of restoring to one convicted of a crime a license to practice the art of healing revoked because of such conviction was considered in *State v. Hazzard*, 139 Wash. 487, 247 P. 957, in which the court concluded that a pardon merely restores civil rights and not the right to resume the practice of the art of healing.

An additional charge filed against Hughes as a ground for revoking his license was that he permitted an unlicensed person employed by him as a bookkeeper to practice medicine in his offices under his direction and instruction. Hughes contended that this charge stated no improper conduct, since the employee in question was a technician and as such had the right to perform certain duties "under the direction and instruction of a physician." The evidence, said the court, shows that this employee was employed full time by Hughes. At first he kept books then he became a technician. Hughes "specialized in the treatment of venereal diseases in men and at his instigation the employee, although not a physician, received and examined patients in Hughes' office, made diagnoses, determined the treatment treated them and accepted fees from them for

Hughes. The employee would do this without any immediate supervision of Hughes and at times when Hughes was away from the office. Such acts by the employee constituted the practice of medicine. Practicing without a license is unlawful. When done at the command and with the knowledge and aid of a physician, that physician is guilty of unprofessional conduct. The very purpose of the act in protecting the public from untrained and incompetent persons is thereby violated by one who should be foremost in upholding it.

The court concluded that proof of either one of the two charges discussed was sufficient to sustain the action of the board in revoking Hughes' license to practice and, accordingly, the action of the board, in effect, was affirmed—*Hughes v. State Board of Health* 159 S W (2d) 277 (Mo., 1942).

**Hospitals Liability for Injuries Caused by Defective Cauterizing Apparatus**—The plaintiff entered the defendant hospital for a cervical operation to be performed by her own physician. After the operation, the physician cauterized the wound with a cautery machine furnished by the hospital. While applying the cauterizing pencil, the physician heard a sparkling or sizzling noise. He stopped the operation, examined the plaintiff and discovered a burn in the pubic area directly above the vagina. Subsequently an abscess formed which did not completely heal until five months later, during which time small pieces of copper wire were removed from it on two different occasions. Contending that her injuries were due to the negligence of her physician and of the defendant hospital, the plaintiff filed suit against both for damages. The trial court dismissed the case against the physician. The case against the hospital was submitted to the jury, which found for the plaintiff. From the judgment entered thereon the hospital appealed to the appellate court of Illinois, first district, third division.

The defendant argued that there was no evidence in the record which indicated, or from which it could be inferred, that it was guilty of negligence in connection with the electrical cautery equipment furnished and that a verdict could not be sustained where essential facts are left in the realm of conjecture and speculation. But, said the appellate court, there can be no doubt that the burn which the plaintiff suffered was caused by the cauterizing machine. The intern and the nurse who assisted at the operation both testified that when the sparkling, sizzling, crackling noise, which sounded louder than normal came from the cauterizing machine, the operation was stopped. The record further established that the abscess developed in the place where the burn was inflicted by the cautery pencil. The attending physician removed three pieces of wire from it and another physician later removed a fourth piece of wire. Only after these pieces of wire were removed did the burn heal. The pieces of wire removed were similar to the wire in the cautery apparatus. In the opinion of the appellate court, the jury was justified in finding that the cauterizing machine inflicted the burn and caused pieces of wire to enter the plaintiff's body. There was, therefore, ample evidence on which to base a finding that the defendant was guilty of negligence. The judgment for the plaintiff was accordingly affirmed—*Delling v. Lake View Hospital Assn and Training School for Nurses*, 33 N E (2d) 915 (Ill. 1941).

**Current Medical Literature****AMERICAN**

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1932 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

**Amphetamine Sulfate for Alcoholism**—Rosenbaum and Lams obtained poor results with amphetamine sulfate in the treatment of 24 patients suffering from severe chronic alcoholism and alcoholic addiction. Some of the possible reasons for the poor results are that the feeling of "well-being" and "lift" that accompanies the use of the drug may act in some patients as a source of security, in others it may tend to combat the effects of a mild depression with which the drinking is associated, while in still others, and this may be the most universal factor, the psychologic effect of the drug may gratify the patient's dependent needs as does alcohol but in a less toxic manner. Certainly the action of the drug at best is only that of a substitute for alcohol. The authors agree with Bloomberg that the main value of the drug in chronic alcoholism is that the free interval produced by the drug might allow time for instituting a more fundamental psychotherapeutic regimen.

**Diphtheria Toxoid and Pertussis Vaccine**—Since 1938 Sauer and Tucker have injected simultaneously 464 children with diphtheria and pertussis antigens. To determine whether the mixing of the two might lessen or augment the antigenic value of either or both, 208 children were injected simultaneously with the 15,000 million bacilli per cubic centimeter vaccine (2, 2 and 3 cc) and in the same arm with diphtheria toxoid (1, 1 and 1 cc) at intervals of three weeks and 244 were injected with the antigens mixed and prepared so that each dose of 2, 2 and 3 cc equaled that when the antigens were given separately but at the same time. The Schick and complement fixation tests and the determination of diphtheria antitoxin concentration of the serum were performed before and after the injections were completed. The diphtheria antitoxin concentration exceeded 0.002 unit per cubic millimeter of serum in 89 per cent of the children retested three to six months after the final injection. The highest incidence and degree of antibody response seemed to occur when the retests were performed six weeks after completion of the injections. The preliminary and follow-up pertussis complement fixation and Schick tests for diphtheria in the two series reveal that the pertussis antibody response in both series compares favorably with the response when months intervene between the pertussis vaccine injections and the diphtheria toxoid injection. In several minor outbreaks of pertussis among noninjected children a few of the injected children of both series were intimately exposed but pertussis did not develop in them. It appears that children older than 2 years can also be protected against pertussis and diphtheria by the administration of three doses of mixed antigens at intervals of three weeks. The number of injections necessary for protection against the two diseases is halved.

**Yolk Sac Antigens in Diagnosis of Lymphogranuloma Venereum**—The agent of lymphogranuloma multiplies luxuriantly in the yolk sac of the developing chicken embryo and suspensions from heavily infected yolk sacs are exceedingly rich in the elementary bodies of the virus. Shaffer and his associates developed an improved antigen to be used either for the Frei test or with slight modifications in a simple complement fixation test. It is possible to carry out the latter in any serologic laboratory and to determine the result within two hours after the test is set up. It has also been possible regularly to demonstrate specific complement fixing properties in lymphogranulomatous serums. The Frei test and the complement fixation test performed with yolk sac antigen confirm the previous reports of the high incidence of infections with the agent of venereal lymphogranuloma concomitantly with other venereal disease. Infection with the virus of venereal lymphogranuloma appears to be widespread and constitutes a serious public health problem. Epidemiologic surveys to study its distribution and prevalence in various population groups should be undertaken by health authorities.

**Sulfathiazoline in Gonorrhea**—Jacoby and his co workers report treatment of gonorrhea in 88 cases with sulfathiazoline in 131 with sodium sulfanilamide formaldehyde sulfoxylate (aldamil) and in 100 with sulfathiazole. The dose for the three compounds was respectively 30 grains (2 Gm) a day for ten days 80 grains (5.3 Gm) a day for four days and 40 grains (2.7 Gm) for the next six days and 30 grains a day for ten days. Seventy-three of the first group were cured in an average of twenty days 40 of the second in an average of sixteen days and 89 of the third group in an average of twelve days. Aldamil although practically nontoxic, was not very effective. With sulfathiazoline the concentration of the drug in the blood was greater and there were fewer toxic manifestations in the major systems with the same dose as with sulfathiazole.

**Chemotherapy of Female Gonorrhea**—A big portion of 110 women whom Smith and Deakin found infectious have become patients because they were named as sources or contacts by men under treatment in the male section of the clinic. Gonorrhea in both the male and the female is treated as a unit of the general work of the clinic following a definite medical and social routine. The lapse rate is extremely low (less than 10 per cent) owing to a systematic case holding program. There is no police regulation or coercive control. The responsibility for medical care is shared by a gynecologist and a urologist. The women were mainly in the second and third decade, the youngest was 14 and the oldest 44. They were nearly equally divided between the white and Negro races. The routine treatment is as follows. After the diagnosis is made the patient is given 1 Gm of sulfathiazole four times a day for five consecutive days. Criteria of cure are the absence of clinical evidence of infection, negative smears and cultures from the urethra and cervix at weekly intervals for three weeks and at

monthly intervals for three months. A single course of 20 Gm of the drug given to 70 women gave a known cure in 44, a probable cure in 21, there were 3 failures and 2 were unable to take the drug. If the patient is not rendered noninfectious by such a single short intensive course of chemotherapy, nothing is gained by prolonging such medication or returning to it in the event of a relapse, for which local, focal, surgical and fever therapy all have a place. Fever therapy has been most effective in sterilizing stubborn types of infection resistant to chemotherapy and to local and focal measures. It is especially indicated when the patient is threatened with permanent crippling of a joint or with blindness. In spite of all the therapeutic measures an occasional woman will have a pelvic abscess that requires surgical drainage. Laparotomy must be the procedure to relieve the semi-invalidism of the individual with a retroverted uterus and prolapsed adnexa bound down by extensive adhesions between the pelvic and abdominal viscera.

**Pinta**—Pardo-Castello and Ferrer discuss recent advances in the knowledge of mal del pinto pinta and carate which are the same disease. The etiologic agent is a spirochete indistinguishable from that of syphilis and of yaws which diseases pinta resembles in its general evolution. It begins with an initial lesion followed by disseminated macules and pink, red, slate blue brown and/or black plaques and ends in a late dyschromic symmetrical stage which usually affects the extremities. It never affects the general health. The complement fixation and precipitation tests for syphilis elicit positive reactions in 60 per cent of the patients in the early and in 100 per cent in the late stages. The lesions are superficial and do not ulcerate. Cardiovascular and cerebrospinal changes have been reported by several authors. Of the authors 41 cases 52.1 per cent showed changes in the spinal fluid similar to those of cerebrospinal syphilis. In 64.5 per cent cardiovascular changes were present enlargement of the aorta and thickening of its wall. High blood pressure was present in 8, in 5 of these there were no aortic changes. Pinta has been transmitted experimentally to man by Leon y Blanco in Mexico and in Cuba. The following conclusions can be drawn from his experiences: 1 Mal del pinto may be transmitted from person to person by superficial epidermal inoculation. 2 Syphilis and mal de pinto are two separate spirochetoses. 3 Mal del pinto confers immunity. Reinfections are partially successful in the early stages but patients with late dyschromic manifestations cannot be reinfectured. The Mexican and Cuban strains of spirochetes cause parallel manifestations. The more limited and

chronic type of the disease in Cuba seems to be due to peculiarities of the terrain and not to the spirochete. Treatment is the same as that for syphilis and yaws. The intravenous injection of arsphenamine and the intramuscular injection of bismuth are specific, arsphenamine, as in syphilis and yaws, is more quickly effective. Mapharsen has also proved highly effective. In the early stages, combined treatment causes the lesions to disappear rapidly. A few weeks after healing, the skin seems normal. In the late stages the hyperpigmented areas disappear almost completely but some vitiliginous patches remain, although repigmentation is extensive. The hyperkeratosis of the palms and soles and the pigmented lesions of the mucous membranes respond to treatment and usually disappear. The Wassermann and Kahn reactions of many patients remain persistently positive in spite of intensive and prolonged treatment. The assertion that pinta is easily cured with an arsenical preparation is doubtful.

**Cutaneous Leishmaniasis** — Dostrovsky and Sagher attempted to determine the optimal dose of infraröntgen rays by treating lesions of 2 patients with different doses and different qualities of rays. As a result, 800 roentgens with a half value layer of 0.027 mm of aluminum was established as the optimal dose. This was given one to three times. In 72 cases of leishmaniasis nodosa and leishmaniasis ulcerosa and in 12 of leishmaniasis recidiva they treated a total of eight hundred and fifty-three lesions by exposure to grenz rays. For the nodular type the dose employed was two exposures of 800 roentgens with a half value layer of 0.027 mm of aluminum and for leishmaniasis recidiva it was from 3,000 to 11,000 roentgens with a half value layer of 0.02 mm of aluminum. The nodular type of lesion usually disappeared within eight weeks and the leishmaniasis recidiva lesion in six to eight months.

**Massive Arsenotherapy of Syphilis** — The hydrochloride of arsenoxide (arsarsolan) has been employed by Prats G and his co-workers in the treatment of 233 syphilitic patients by the massive dose-continuous intravenous drip procedure. The average dose was 12 Gm for men and 0.8 Gm for women. The first 111 patients, whose period of observation extended up to seven months, are discussed. Spirochetes disappeared from the lesions during the first twenty-four hours, and the darkfield examination was most often negative between the fifth and the eighth hour after the treatment was started. The large infiltrated or gangrenous chancre healed in an average of ten days. The superficial erosive lesion healed in five or six days. The papular secondary syphiloderm disappeared in variable periods. Enlarged inguinal lymph nodes diminished in size slowly and often were still palpable after several months. The clearing of the serologic reactions occurred between the second and the fifth month. Of 69 patients observed for seven months, 55 (80 per cent) gave negative reactions and 10 (14 per cent) almost negative reactions, in 4 cases (6 per cent) the treatment was considered a failure. This period of observation, seven months, is too short to permit of final conclusions. Approximately 94 per cent of the patients were proceeding in a satisfactory manner.

**Artificial Fever Therapy** — Artificial fever, at levels of 105 to 107 F, was used by Trautman in the treatment of 1,243 patients. 653 had gonorrhea, 248 syphilis, 57 ocular disorders, 7 venereal lymphogranuloma, 127 nonspecific urinary infections, 28 acute and 42 chronic infectious arthritis, 18 leprosy and 25 chronic hypertrophic arthritis, 38 had twenty-two different diseases. One patient died suddenly several hours after the fever session was completed. Despite the fact that apparently a fair amount of salt solution was administered during the treatment,

the secondary fever following the session and the basic cause of death was principally a fluid and chloride deficiency. Since death from treatment is a possibility, treatment must be terminated as soon as danger signs present themselves. There were two hundred and thirty-eight complications which caused termination of treatment. These were cardiovascular, mental convulsive, hyperesthetic and hypoesthetic. There has been a significant decrease in the serious complications (seventy-one) during the last two and three-fourths years, when 2,272 treatments were given as compared with the previous four and or fourth years, when 4,609 sessions of fever were induced.

**Hepatic (Hepatorenal) Factor in Burns** — The mortality for the 1,243 burns treated at Charity Hospital in the six and a half years ended June 30, 1941, was 17.46 per cent (217 deaths). Among 217 fatal cases the upper limit of safety (a burn of 50 per cent of the surface of the body) was exceeded in 78 and death could be expected. Recovery of at least a fair proportion of the other 137 patients with less than the area involved might have been expected. Boyce states that there was no reason to anticipate a fatal outcome in 14 in whom only 15 per cent and in 9 in whom only 10 per cent of the surface of the body was involved, or in many in whom the burn was of first and second degree. Such facts suggest that other than merely physical factors of extent and depth determine the prognosis. Obvious factors are extremes of shock, infection, hemoconcentration, toxemia and the hepatorenal factor. The theory of hemoconcentration and the toxemic theory are not mutually exclusive. The renal lesion in burn is considered as a secondary phase of the hepatic lesion and a parallel is traced between certain deaths from burns and the so-called liver death and the liver-kidney syndrome. Analysis of the 1,243 cases of burns showed that toxemia of all degrees played a part in more cases than either shock or pain, but that extreme toxemia was relatively infrequent. The failure of the liver in its function of detoxification because it is overwhelmed by the toxins poured into the circulation from the injured surface. If the patient lives long enough, the kidney, the great organ of detoxification in the body, is overwhelmed in its turn. Acute toxemia can be minimized by adequate measures. The administration of plasma, high protein solutions, decreases or prevents fatty metamorphosis. Dextrose, if administered on a strictly calculated basis, does not increase the promiscuous administration of fluids is never safe. Certain other therapeutic measures should be reserved for the light of their possible effect on the liver. Any measure which has its accompanying depressive effect on hepatic function should be avoided whenever possible. The sulfonamide should be employed with caution.

**Sulfathiazole Ointment for Burns**—The treatment of burns in war injuries has brought out the observation that tannic acid is not as satisfactory as is commonly stated and that plasma replacement is of life saving value. Replacement of plasma is the most important consideration in extensive tissue damage with the escape of this portion (protein) of the blood. Harkins compounded a rule which is an effective guide to the administration of plasma: 100 cc of plasma for every 1 per cent rise in the hematocrit above 44 per cent. Allen and his co-workers report the treatment of 4 severely burned patients admitted to the Albert Merritt Billings Hospital fifteen minutes after an explosion in a chemical laboratory and treated with sulfathiazole ointment. Pain was promptly alleviated. Infection was minimized and scarring was apparently less severe. Remaining islands of epithelium were preserved and possibly even stimulated by its application. A large denuded area cannot be kept sterile by pressure dressings; some bacteriostatic material is needed, particularly in wartime when many patients must be treated by a small staff. The coagulation by tanning probably kills much of the epithelium which would ordinarily survive. Furthermore, tanning fixes the viable tissues on the surface of the denuded areas and thus scarring is somewhat more extensive. Sulfathiazole ointment was particularly effective against the common pathogens. A 20 per cent sulfathiazole ointment placed on the donor site of a dermatome graft did not retard epithelial regeneration. The base for the ointment was aquaphor, which contains 5 per cent ox-cholesterol and 95 per cent petrolatum. Absorption of sulfathiazole from the extensively burned areas was minimal. The sulfathiazole in the circulating blood failed to exceed 15 mg per hundred cubic centimeters. Results with the ointment at the University of Chicago Clinics in the treatment of superficial ulcerating areas, abrasions, infected superficial wounds and for the impregnation of gauze packs for infected surgical wounds have been gratifying.

**Body Water Partition, Extracellular Electrolytes and Shock**—Ashworth and Kregel studied in dogs the various changes that occur in the electrolytes of the extracellular fluid and in the processes of the body in regulating the osmotic pressure of the intracellular and extracellular fluids in shock produced by hemorrhage, trauma or the injection of a 25 per cent solution of sodium chloride. After shock the plasma volume was greatly reduced, especially in shock following the intraperitoneal injection of the saline solution. It was intermediate after traumatic shock and least in hemorrhagic shock. The interstitial water changes with but few exceptions, indicated a striking increase in dogs shocked by saline solution, a decrease in dogs shocked by hemorrhage and an increase in 2 dogs and a decrease in 1 dog shocked by trauma. The intracellular water decreased after saline shock, increased after hemorrhagic shock and decreased after traumatic shock. The changes in the size of the erythrocytes invariably corresponded directly, it not proportionally, to the intracellular fluid change. In shock from hemorrhage the plasma sodium, with 1 exception, increased when interstitial water decreased and vice versa. The few experiments with traumatic shock render a conclusion difficult with regard to changes in plasma sodium. A fairly constant, slight but definite increase was noticed in plasma potassium in both hemorrhagic and traumatic shock. In hemorrhagic and traumatic shock glomerular filtration fell during shock. In shock from hemorrhage, tubular reabsorption of water increased, sodium reabsorption increased and sodium was conserved two thousand to four thousand times in its passage through the tubules while potassium reabsorption decreased. In traumatic shock this conservation of water and sodium was absent, while potassium was apparently conserved. The body conserves sodium and water after hemorrhage so that the retained fluid would be of normal osmolar concentration, but how this is brought about by the renal tubules is difficult to solve. The regulating influence of the adrenal cortex hormone, the pituitary hormones and the hypothalamus must be considered. Although the study indicates a decrease in interstitial fluid in shock from hemorrhage accompanied by anoxemia and an increase in the interstitial fluid in traumatic shock, these changes take place only partly between plasma and interstitial fluid but largely between the interstitial and the intracellular fluid. The potas-

sum of the extracellular fluid did not increase until just before death in hemorrhagic and traumatic shock and this terminal increase may be the result of a final severe injury of the cell membrane from anoxemia allowing potassium to pass freely from the cell. It is probably an extreme compensatory effort to reestablish an equilibrium between the osmotic pressure within the cell and its internal environment, the extracellular water. There is reason to believe that, when cellular osmotic pressure is increased the tubular reabsorption of potassium decreases and that, when cellular osmotic pressure is decreased (or extracellular osmotic pressure increased), tubular reabsorption of potassium increases.

**Treatment of Shock from War Injuries**—One of the reasons for irreversibility of the shock syndrome according to Harkins, is anoxic damage to tissues, for the prevention and treatment of which early administration of oxygen which effects a considerable rise in the alveolar oxygen, is imperative. The cortex of the adrenal gland is essential to life, but its use in the treatment of shock rests on an infirm foundation as physicians who have used it do not state definitely which substances, desoxycorticosterone corticosterone compound E or others, were used. This phase of the therapy offers much promise. Rhoads, Wolff and Lee report encouraging results with it in the treatment of burn shock, but Besser's report on the pre-

operative use of desoxycorticosterone acetate to prevent surgical shock tends to discredit its value. In using numerous blood substitutes suggested, the maintenance of blood volume is the chief requisite. Of the substances, plasma, dried in cellophane cylinders (the rotor pervaporator) has an important wartime application because it is cheap, easy to store in a sterile state and large quantities can be readily produced. Plasma and pectin are especially adaptable to wartime use. Pectin, if it proves to be a satisfactory blood substitute, has the advantage because it can be obtained from fruit by the ton. The fact that pectin is excreted within thirty-six hours suggests that it would be of only temporary value. In the United States 6,000 persons die every year from burns and of these 60 to 75 per cent die of burn shock. Since plasma, rather than whole blood, is lost in burns, the administration of 100 cc of plasma for every point the hematocrit is above the normal of 45 best supplies the deficiency.

**Tannic Acid Therapy and Liver Necrosis**—The sequence of the phenomena which follows severe burns is illustrated by 10 consecutive necropsies performed at the Hartford Hospital. Two of the patients, Wells and his associates say, died from direct trauma within two to four hours after injury, 1 died of shock or fluid imbalance in eleven hours, 4 died of "toxemia" in ninety-three to one hundred and twenty hours, 1 admitted late died of infection in one hundred and twenty hours and 2 died of complications, 1 as result of an associated cerebral laceration and 1 of a cerebral glioma—the glioma was probably the cause of the convulsive seizure during which the patient was burned. In each of the 4 patients who died of "toxemia" central lobular hepatic necrosis was exhibited as an especially prominent lesion or as the sole cause of death. In the treatment of these 4 patients a tannic acid bath was employed in which a careful debridement was done without an anesthetic. A thin, sterile tan was secured and maintained by a tannic acid spray and kept dry by a current of warm air from a commercial hair drier. Dextrose in isotonic solution of sodium chloride was given intravenously in adequate quantities. Each patient received transfusions of whole blood, and oxygen intranasally. The common denominator in the 4 appeared to be the tannic acid. The possible role of tannic acid in the production of hepatic damage in rats was investigated. Subcutaneous injections of a 5 or 10 per cent solution of tannic acid were given in doses that did not exceed 15 cc at any one site. No anesthesia was used. Rats that survived were killed on the third or fourth day. Of the 77 rats injected, 8 did not survive. Every one of the others showed some degree of hepatic damage, which, in general, varied directly with the amount of tannic acid injected and the number of injection sites employed. All other organs examined, except for a slight cloudy swelling appeared normal. The hepatic damage produced by the tannic acid was characterized by necrosis of the hepatic cells in the central portion of the lobule, a variable zone of intact cells in the peripheral area exhibiting a granular cytoplasm and enlargement of the nuclei, irregular clumping of hyperchromatic nuclear material, regular and bizarre mitosis, some with dis-

persions of the chromosomes and hemorrhage and leukocytic infiltration in minor degree in areas of necrosis. The degree of hepatic damage was directly proportionate to the amount of tannic acid injected.

**Adenocarcinoma of Cervix**—According to Simpson and his associates, a survey of the patients presenting themselves at the state institute for treatment of cervical cancer showed 1 adenocarcinoma for each 26 squamous cell carcinomas. Sixty-three patients, for whom microscopic sections were available and five years had elapsed since treatment were selected for study. Microscopically the tumors were placed in four categories: grade 1 showed malignant epithelial cells in gland formation and grade 4 was composed of a solid growth of anaplastic cells with only an occasional attempt at gland formation, grades 2 and 3 presented intermediate microscopic pictures. Dependent on their localization or extension the neoplasms were placed in their respective clinical groups. In the lowest groups were those tumors in which the neoplasm was confined to the cervix. Of the patients alive and well five years or more 46 per cent were placed both in the low clinical groups and in grades 1 or 2, while only 25 per cent with grade 3 and 4 tumors placed in the same low clinical group lived for the same period. Patients placed in the intermediate clinical groups with tumors of grade 1 or 2 showed a 29 per cent five year cure rate, while the five year cure rate for those in the same clinical groups with tumors of grade 3 and 4 was only 4 per cent. In the high clinical groups there were no five year survivals. Of those who died, 15 per cent were in the low clinical and microscopic groups, while the remaining 85 per cent had grade 3 and 4 tumors or were in the high clinical groups. The duration of symptoms in these patients showed that some had disturbances for only a few weeks before examination, while others had suffered from irregular menstruation together with discharge and pain for several years. Tumors of a low malignant grade may persist for many years and, while giving rise to symptoms indicative of malignant change, may remain localized and fail to metastasize. On the other hand, highly anaplastic malignant infiltrating growth may cause severe disturbances early. Treatment consisting of interstitial irradiation with gold seeds together with intracervical irradiation with tandem tubes of 50 or 100 mg of radium following this a course of external irradiation with 200 kV was given. Twenty-four, or 38 per cent, of the 63 patients alive and have remained well for five years or more. Ten of the women in the series had not borne children.

**Tocopherols in Fibrositis**—Steinberg used tocopherols, a trade name for a product containing the natural mixed alpha, beta and gamma tocopherols—in the treatment of fibrositis with primary or secondary fibrositis. The dose was 0.2 cc of the natural mixed tocopherols three times a day after meals. The patients were treated for three months. If no improvement was observed in the first three weeks of treatment none occurred later. No side effects were observed. Whereas several patients on tocopherols the wheat germ oil repeating or causing mild disturbances, none reported such effects with tocopherols.

the patients with primary fibrositis were completely relieved of all symptoms. The drug was useful in alleviating muscular spasm of the back of 4 patients with Marie Strümpell arthritis. The product was relatively ineffective in secondary fibrositis. It may prevent rather than cure the severe muscular atrophy of atrophic arthritis. Primary fibrositis is a metabolic rather than an infectious disease.

**Sulfaguanidine for Chronic Idiopathic Ulcerative Colitis**—Caver and Ruffin used sulfaguanidine in the treatment of 17 hospitalized patients with active ulcerative colitis. Definite improvement was observed in 4 and some improvement in 10 at the end of treatment but the effect could not be attributed to the drug alone as diet, rest, vitamin therapy and psychotherapy all play an important therapeutic part. The results obtained were no different from those obtained in patients receiving only nonspecific therapy or other sulfonamides.

Administrative Organization for Mental Hygiene A H Vogel—p 537

**Acute Diarrheal Diseases**—The need for a simplified procedure for obtaining fecal cultures to diagnose bacillary dysentery became apparent to Hardy and his collaborators in their study of institutional inmates. They devised a rectal swab technique which they found to be widely applicable. A small lubricated rubber tube containing a dry sterile swab within its lumen is inserted. Gum rubber tubing (0.5 cm inside and 0.8 cm outside diameter) is cut into 12 cm lengths. One end is beveled for about 1 cm. Tightly wound cotton swabs prepared on the usual wooden applicators are placed in the rubber tubes with their tips slightly short of the beginning of the beveled opening. The external end of the tube is lubricated. The jelly should not reach the swab or cover the opening. The unit is easily inserted past the sphincter and up about half the length of the tube. The swab is exposed by withdrawing the tube 2 to 3 cm. The specimen is collected by rotating the applicator while sweeping it in a circular motion. The swab is then drawn back into the tube and in this position removed from the patient. The rubber tube and swab are separated and the latter is immediately used for plating. This method of obtaining rectal swabs is rapid and convenient for hospitalized patients and for study of men in military barracks. The new Shigella-Salmonella agar yields a significantly greater number of positive isolations than desoxycholate citrate medium. A total of 6324 examinations performed in New Mexico, Georgia and Puerto Rico on individuals who stated that they had had no diarrheal disorder during the preceding year disclosed 239 (3.8 per cent) to be positive for Shigella dysenteriae while in New York City only 2 (0.1 per cent) carriers were found among 1639 persons

examined. Convalescent and passive carriers of Shigella dysenteriae are common, and a large proportion of them may be identified with relative ease if persons with diarrheal disease and their contacts are promptly studied by the use of the new highly selective culture mediums Shigella-Salmonella agar and desoxycholate citrate medium. The possible value of sulfaguanidine in the control of Shigella dysenteriae infection was determined among inmates of a mental hospital. Inmates were selected with an approximate ratio of 1 infected to 4 noninfected persons. No general measures of control other than treatment with sulfaguanidine, were instituted under conditions favorable for the spread of infection. After five doses of the drug the number of positive cultures and of infected individuals was reduced by more than 50 per cent. After three days of treatment those infected on admission to the study were almost free from infection. A practical program for specific control can be determined only through experience, but preventive measures are most needed in readily controlled groups institutional inmates, men subject to military orders, families with an infectious enteric disease involving some member (usually a child) and all persons with positive or suggestive organisms. The dose of sulfaguanidine used has varied but has not been less than 0.3 Gm daily per kilogram of body weight for at least four days.

**Vitamin Deficiency Cardiac Conditions**—Garland and McKenney state that the roentgenograms of patients with vitamin D and C deficiency alone or in combination, presented no evidence of cardiac enlargement or failure while those of most of the patients with vitamin B<sub>1</sub> deficiency showed evidence of cardiac enlargement and failure. The heart shows generalized enlargement and diminished pulsations. The response to thiamine therapy is usually prompt and satisfactory; the classic symptoms of cardiac failure abate rapidly and the size of the heart diminishes greatly within two weeks but some patients with perhaps irreversible cellular changes show little improvement even on adequate diet and rest. These cases are usually terminal or are complicated by myocardial damage of other origin. There are no pathognomonic roentgen signs in cardiovascular disease due to vitamin deficiency but the finding of an enlarged poorly contracting heart and mild pulmonary congestion in an adult without valvular disease should suggest the possibility of thiamine deficiency in addition to the other well known causes of such changes. The clinical exclusion of hypertensive disease increases the possibility of the enlargement being avitogenic and its prompt diminution under thiamine therapy confirms the diagnosis. Cardiac enlargement in scurvy and rickets is probably always due to an associated but masked thiamine deficiency. Fourteen cases of cardiovascular disease due to thiamine deficiency (beriberi hearts) in adults, 2 of ascorbic acid deficiency in adults and 1 in an infant, 5 of combined ascorbic acid and vitamin D deficiency in infants and 4 of vitamin D deficiency are reported. In none of the nonthiamine cases was there any definite evidence of cardiovascular disorder.

**Mass Roentgenography of Chest in the Army**—Consideration of the available roentgen procedures for examining men for the services. Lorimier points out reveals a preference for stereoscopy and that the attributes of stereoscopy are par-

ticularly important when hundreds of cases must be studied in a day and when the roentgenograms may serve for legal evidence. When mass roentgenography is to be conducted, stereoscopic viewing of the 4 by 5 inch films is given priority, the 35 mm film is also highly rated. As regards fatigue and the field of visual concentration, the detailed viewing of a standard 14 by 17 inch film is comparable to studying at least four, and possibly six, of the miniatures. The 4 by 5 inch photograph of the fluoroscopic image was adopted as the official procedure, in doubtful cases the standard 14 by 17 inch conventional film is added. An intensity of radiation of 200 milliamperes is believed practical. The x-ray tube should withstand no less than 700,000 heat units per hour. Single emulsion x-ray films are recommended because they increase the sharpness of detail and decrease the contrast characteristics. High kilovoltages are favored. The use of a wafer type of grid is recommended for very thick chests and when a kilovoltage of more than 85 is required. For the lens a relatively short focal-fluoroscopic screen distance, 36 to 48 inches, is believed best. The handling of two hundred to four hundred such examinations daily presents a definite radiation hazard to the technician, for if the equipment is not properly positioned and lead protective shields used he will receive more than 0.1 roentgen, the recognized daily tolerance dose.

**March Fracture**—As hundreds of thousands of young men entering the Army will walk distances much greater than those to which they are accustomed, march fracture is certain to increase. Krause saw only 1 case in three and a half years prior to active duty with the Army, but he has seen 9 cases in six months at the Station Hospital, Fort Jackson, S. C. The pathogenesis of the fracture is not clearly understood, but all patients give a history of prolonged and repeated foot strain. The first symptom is usually a slight discomfort in the metatarsal area, which slowly increases and is manifest only when the foot bears the weight of the body. This pain and its accompanying tenderness are usually localized at the site of the fracture. Technically perfect roentgenograms, showing maximal detail, are needed for an early diagnosis. On the basis of the changes seen in the roentgenograms the syndrome may be divided into four stages. 1. Within the first seven to ten days after the onset of symptoms no pathologic changes may be seen because the fracture line is narrow and often incomplete and because no displacement occurs. 2. After one to three weeks a loosely calcified and fuzzy callus is seen around the shaft of the second or third metatarsal, the fracture line is usually visible and the callus may be abundant if the foot has not been placed at rest immediately. 3. After immobilization in a plaster cast the callus in three to six weeks becomes more dense and circumscribed and less bulky. 4. After several months the only remaining sign is slight thickening of the cortex. March fracture must be differentiated from osteogenic sarcoma and Ewing's tumor. The treatment is that of any fracture in this area: immobilization, preferably in a plaster cast, for three to six weeks followed by physical therapy.

**Weil's Disease**—Lester and his associates give the clinical and epidemiologic details of 14 cases of Weil's disease that occurred within two and one-half years in a single locality (a mine) in Alabama. The diagnosis in each was confirmed by laboratory studies. The coal mine in question was not unusual except that it was extremely damp. As many of the patients represented persons engaged in operating pumps and maintaining pipe lines, a blood survey was confined to the men of this crew who were not known to have developed the disease. Of 16 such individuals available the blood of 3 showed agglutinins in dilutions sufficient to be diagnostic, only 1 had a definite history of an acute illness accompanied by jaundice. Other mild or subclinical cases might have been detected had blood specimens been examined from those engaged in mining and the loading of coal. However, the great majority suffered by those who operate pumps and maintain pipe lines. Twenty-five men customarily work on this crew. Of the two and one-half years, 8 contracted Weil's disease. 68 rats trapped in the mine and examined by the authors showed spirochetemia and icterohemorrhagiae was found in the livers.

Microscopic preparations of positive rat kidneys showed the leptospiras to be distributed in great masses lining the tubules. Direct examination of mine water and of muck collected from the bottom of pools revealed many leptospiras morphologically typical of *Leptospira icterohemorrhagiae*. Following the institution of control measures (rat elimination in the mine and surrounding vicinity and education of the workers and villagers) no further cases have occurred. The true incidence of Weil's disease is probably greater than realized and will be determined more definitely only when physicians become fully acquainted with the disease.

**Convulsions of Anesthesia**—The etiologic factor or factors responsible for anesthesia convulsions are still obscure and, as there is no method to predict such a convulsion, prevention is impossible. However, Tve points out that the complication is more prone to occur under certain conditions and should be apprehended in a child or young adult who is excited or frightened before the anesthetic is started in any patient with sepsis and a temperature of 101 F or more and in patients who have been overdosed with atropine. After a convulsion has been precipitated it should be arrested before it becomes generalized. As soon as twitching of the muscles about the face is noticed the operative procedure should be suspended and the patient given deeper anesthesia. Under deeper anesthesia the convulsion will not become violent, and after a few minutes it will cease and the operation can be continued. If the convulsion recurs when the operation is resumed or if it becomes worse an intravenous barbiturate should be prepared so that it can be used at a moment's notice, after which the operation may be resumed if a patent airway has been established and oxygen is administered. A mixture of oxygen and carbon dioxide may be necessary to stimulate respiration. Artificial respiration may be necessary, particularly if an overdose of barbiturate was given. Five cases of anesthesia convulsions with 2 deaths and 3 recoveries are reported. 1 patient died during the convulsion and 1 after twenty-nine days, during which time a state of decerebrate rigidity without consciousness existed. The 3 patients who recovered were given deeper anesthesia. The convulsion of 1 recurred when the operation was resumed but it was controlled with intravenous anesthesia and the operation was completed. The most logical etiology of convulsions of anesthesia is that of Raab that the convulsions are due to hyperventilation tetany.

**Diethylstilbestrol for Gonococcal Vaginitis**—Woodruff and TeLinde administered diethylstilbestrol to 50 children with gonococcal vaginitis. 29 with suppositories, 5 with suppositories for whom oral therapy was unsatisfactory and 16 orally. The suppositories contained 0.1 mg of diethylstilbestrol. One suppository was inserted into the vagina every night during the course of treatment. The vaginal smears of 22 became negative after one week of 8 within two weeks and of 2 within three weeks and of 1 in twenty-five days. 1 failed to respond after five weeks of treatment but did so to oral therapy. There were five recurrences or reinfections, all of which responded rapidly to a second course. At the end of seven days of treatment the smears of only one third of the patients receiving oral therapy were negative, but at the end of two weeks the percentage of negative smears was approximately the same (90) for the two types of therapy. The optimal daily dose by mouth was 1 mg. Nausea and vomiting occurred in an appreciable percentage of the patients given the drug by mouth, whereas it did not occur in any treated with suppositories.

**Acute Cholecystitis**—Acute cholecystitis Barrow and Massie state, was encountered in 159 of 1000 patients with disease of the gallbladder. A statistical analysis of the 159 patients shows that the mortality rate increased in direct ratio to the interval between the onset of symptoms and admission to the hospital. Early hospitalization and prompt operation of patients with acute cholecystitis was associated with a minimal morbidity and mortality and little subsequent difficulty. Partial cholecystectomy is frequently wise for patients with extensive inflammation around the common duct. Jaundice in patients with acute cholecystitis may be due to inflammatory changes around or in the bile ducts rather than to choledocholithiasis and is not by itself an indication for exploring the common duct.

\*Diethylstilbestrol Dipropionate Clinical Comparison with Estrone and Estradiol Benzoate 502 Cases F E Harding Los Angeles—p 207

**Resections of Rectum**—The 265 cases of rectal cancer admitted to the University of California Hospital in the last twenty years are divided by Woolf into two groups: those seen between 1921 and 1930 and those seen between 1931 and 1940. The mortality from colostomy and posterior resection was 12.5 and 8 per cent respectively for the first ten and the last ten years. The respective rates for the two periods of one stage abdominoperineal resection were 50 and 16.6 per cent, for two stage abdominoperineal resection they were 25 and zero per cent, for local excision 50 and zero per cent and for the Hartmann anterior resection during the last ten years the mortality rate was 10 per cent. The excessive morbidity or complications and residual difficulties that follow two stage procedures arise directly from the operations themselves. A careful survey of the postoperative difficulties ensuing after rectal resection shows them to be numerous and often grave. After the two stage operation of the Mummery type 1 patient in 3 or 4 would have permanent or long standing physical disorders in addition to the colostomy. For some of them additional operations may be necessary. It would seem that the best way to avoid many of the complications would be not to do this type of operation if it can be avoided without fatal risk to the patient. Complications and sequelae are by no means obviated by the one stage operation, many of them are due to the abdominal part of the procedure, but they are considerably less than in other types. The complications generally affect the urinary and/or intestinal tract. The reduction in mortality at the University of California Hospital has been partly due to a more gentle and painstaking technic, an exhaustive preoperative survey of the physical assets of the patient, teamwork in the operating room, relegation of certain specialized supervision to the departments concerned during the whole period of hospitalization and the utilization of the newer aids to surgery, chemotherapy, vitamin therapy and attention to altered physiologic body mechanisms as they occur. Morbidity and mortality are intimately connected.

**Diethylstilbestrol Dipropionate**—The degree of clinical improvement both symptomatic and physical following therapy with theelin, dihydrotheelin and diethylstilbestrol of 502 patients is discussed by Harding. The response to the various hormones was determined by the change in clinical symptoms: hot flashes, mental depression, menstruation and nervousness. All three preparations were used orally and parenterally. On a basis of weight estradiol benzoate (dihydrotheelin) was more effective than theelin and diethylstilbestrol dipropionate was the strongest estrogen of the three. There is a qualitative and quantitative difference in the substances. In this respect the natural estrogens seem to have an advantage over diethylstilbestrol dipropionate. The effect of estradiol benzoate lasts a little longer than that of theelin and it is generally more effective in severe cases. Diethylstilbestrol dipropionate was definitely superior in relieving mental depression. In doses of 0.5 mg or more diethylstilbestrol dipropionate was likely to inhibit menstruation and to cause uterine bleeding in women who were not still menstruating. Diethylstilbestrol dipropionate is a powerful pharmacodynamic agent and should be administered with care. Only enough to relieve the patient's symptoms should be prescribed. Still about 10 per cent of patients cannot use it because of adverse symptoms. They prefer theelin or estradiol benzoate. Substitution therapy for relief of the symptoms of hypoeestrogenism must be individualized.

\*Chemical Coagulants in Treatment of Burns P. B. Medawar —p. 350  
Pneumococcal Meningitis: Seven Cases with Five Recoveries V. N. Leyshon —p. 352

**Antiseptic Emulsions for Superficial Granulating Areas**—During the last eighteen months Heggie and his collaborators have used lymphagogues followed by antiseptic emollient dressings for the treatment of infected superficial burns. Lymphagogues were most effective in removing gross infection and in separating sloughs. The antiseptic in the emulsion was then usually capable of completing and maintaining the sterility of the area while the emollient dressing preserved the recently healed tissue when changes were necessary. For the water in oil emulsion they modified the buffered isotonic proflavine sulfate solution suggested by Russell and Falconer for head injuries. The concentration of proflavine sulfate was 0.4 per cent, and urea was added to the extent of 5 per cent. The oil in water emulsion was so constituted as to behave as a "wet dressing," from which the proflavine of the abundant buffered isotonic water phase would be available in requisite concentration to sterilize the granulating areas. Water in oil emulsions were made as water creams (40 to 50 per cent of water) and were designed to be used as occlusive dressings for cases of light or reduced infection in which the main object was to leave the area undisturbed until healing was complete. Gross infection was removed by the action of lymphagogues. Sterilization was usually obtained by the fourteenth day. The emulsion is warmed to body temperature, spread liberally on two thicknesses of gauze, applied to the burned area so as to include the margins, then two or four thicknesses of gauze and a layer of wool, and the whole is bandaged and left for seven to fourteen days, according to the amount of exudate appearing in the superficial dressings. Superficial areas healed at the end of fourteen days, others were redressed and left for a further

seven to fourteen days. The dressings can be changed with ease, most of the water phase evaporates and leaves a thin layer of "unguent." If a dressing is stuck it should not be disturbed. Some patients who were feverish were also given sulfanilamide or sulfapyridine. Recently emulsions have been made incorporating the sulfonamides, but as yet they have not been tried. Proflavine oleate, 1 per cent, in cod liver oil with or without petrolatum would make an excellent antiseptic preparation for the initial treatment of burns.

**Chemical Coagulants in Treatment of Burns**—Medawar tested which coagulants were capable of "fixing" tissue in burns so that it would be resistant to digestion by proteolytic enzymes. Coagulation therapy attempts to form a surface seal or "tan" over the lesion, to restrict external fluid loss, to furnish a general protective and analgesic function and to transform dead tissue from being part of the lesion to being its most immediate dressing. All the coagulants considered fix tissue in the microscopic sense, which does not consider resistance to proteolytic digestion, but the stability of the compounds they form with protein varies greatly. Picric acid, for example, can be washed out of tissue merely by prolonged irrigation with water, therefore the potential danger of systemic poisoning when it is applied to extensive burns. Results with cylinders of clotted cockerel blood plasma (fibrin and serum protein) suggest that tissue fixed by tannic acid or methylrosaniline is stabilized to the action of body fluids, and that in burns layers of coagulated tissue must be split off as intact sheets since they cannot be digested away. Silver nitrate, because of its secondary reactions, introduces special problems. Since coagulants destroy living cells with which they come in contact, their penetrative power must be considered. Tannic acid and methylrosaniline were the most feeble penetrants. Increasing the strength of a coagulant did not proportionately increase its penetrative power. The thickness of the coagulated crust formed on a burn does not necessarily represent the depth to which the coagulant has penetrated. The crust may be formed by the building up of coagulated serous exudates in layers from the inside outward.

Lumbago and Abdominal Pain M. Kelly —p. 311  
Some New Aspects of Electrocardiology O. V. Short —p. 317

**Surgical Treatment of Congenital Pyloric Stenosis of Infancy**—The four principles involved in the treatment of congenital pyloric stenosis are correction of the alkalosis, chloride deficiency and dehydration, relief of the pyloric obstruction, maintenance of the infant's nutrition and prevention of infection. Alkalosis and infection are the two main causes of death. They were responsible for 38.6 per cent and 40.9 per cent, respectively, of the deaths in a series of 294 infants treated surgically from 1928 to 1938. The alkalosis and chloride deficiency can be corrected by the slow administration of 1,200 cc of isotonic solution of sodium chloride by the continuous intravenous drip method. The mortality rate for 106 infants treated surgically from 1938 to 1941 was 2.8 per cent as compared to 15 per cent for the 294 infants treated before 1938. This difference in mortality is attributed to Williams to the use of adequate preoperative saline therapy, which has abolished death due to alkalosis, to the adoption of isolated nursing, which has considerably reduced cross-infection, and to the use of blood transfusion for all extremely ill infants, which has eliminated deaths from inanition. The operative progress (daily gain in weight and average survival) of the 106 infants was better than that of the 294 infants. This must be attributed to more effective treatment before and after operation.

\*Antagonism and Synergism of Female and Male Sex Hormones W Jadassohn and H E Fierz—p 1554  
Mode of Action of Sulfonamide Derivatives G A Moosbrugger—p 1556

**Suitable Blood Donors**—Meyer-Wildisen stresses that a blood donor service must see to it that donors of the same group are available and that universal donors are obtainable. He suggested in 1939 the employment of the double designations AB-I, A-II B-III and IV-O. Persons of the AB-I group have the advantage in that they can receive blood from every donor, because the group is one of universal recipients. However, if a patient in this group is to receive blood of his own group he is at a decided disadvantage, because his group has an incidence of only 2.4 to 4.3 per cent. Blood groups A-II and IV-O are found in from 80 to 90 per cent of all persons. Thus if donors are limited to these two groups more than 80 per cent of persons can be supplied with blood of their own group and furthermore donors of group IV-O can serve as universal donors, and recipients with group AB-I are universal recipients. Other factors play a part in the selection of a blood donor, such as the health of the donor and the recipient dangers for both and changes in the blood that nullify the value of the transfusion. Loss of blood is detrimental for the donor if his general condition is impaired but in conditions like polycythemia, polyglobulism and hypertension donorship is not only not harmless but advantageous. Persons with pyogenic or septic infections should be excluded from donorship. The suitability of the veins for withdrawal of blood must be considered and the blood to be transfused must be of good quality in every respect.

**Antagonism and Synergism of "Female" and "Male" Sex Hormones**—Jadassohn and Fierz stress the following points: 1. If androsterone or testosterone propionate in an aqueous solution is dropped on the nipple of male guinea pigs the nipple becomes lengthened, but not quite as much as when estrone is applied. 2. Application of drops or subcutaneous injection of androsterone and testosterone propionate in an oily solution does not cause lengthening of the nipple. 3. Castration intensifies the effect produced in the nipple by percutaneous application of estrone (inhibiting effect of testes). 4. Injections of testosterone propionate inhibit the effect which the percutaneous application of estrone exerts on the nipple. Thus the male sex hormone which in one form of application (percutaneous with aqueous solutions) effects an enlargement of the nipple, inhibits the nipple enlargement produced by estrone in another form of application (subcutaneous injection of oily solution). Thus depending on the mode of administration testosterone propionate may have opposite effects on the same test organ.

- \*Immunization with BCG in Rio de Janeiro A de Assis A de Carvalho and W Guedes Pereira—p 487

**Immunization with BCG in Rio de Janeiro**—De Assis and his collaborators heads of the central department for administration of BCG vaccination to newborn infants and infants in Rio de Janeiro administered BCG vaccine to three groups of infants. Newborn infants exposed to tuberculous contacts were given the vaccine on the second, fourth and sixth days of life in a dose of 0.03 Gm every two days up to a total of 0.09 Gm. Infants not exposed to tuberculous contacts were given the vaccine in the same doses on the fifteenth to the twentieth day after birth. Infants who passed the twentieth day of life without having had the vaccine constitute the third group. They are given the vaccine when they reach 6 months of age provided they are nonallergic as demonstrated by negative tuberculin skin tests and intradermal reactions and by roentgen examination. Infants in the third group receive the vaccine in one dose of 0.2 Gm by mouth. The mothers bring

their infants at periodic intervals for examination. The BCG vaccine should not be administered to infants who have had any obstetric accident, to those with grave congenital heart disease or to those with acute or general infection. When jaundice of the newborn is acute it is advisable to wait until it disappears before administering the BCG vaccine. The vaccine is reliable and harmless.

- \*Nicotinic Acid in Therapy of Gangrenous and Ulcerous Stomatitis and Vincent's Infection A Correa and L Oriente—p 439

**Gangrenous and Ulcerous Stomatitis**—Correa and Oriente stress the role of avitaminosis in the pathogenesis of ulcerous stomatitis and the frequent occurrence of Vincent's infection as a complication. The authors report good results from topical applications of a 20 per cent solution of sodium hypochlorite four or five times a day and of nicotinic acid by mouth in doses which varied from 100 to 400 mg. The average duration of the treatment was between twenty and thirty days. Subacute ulcerative stomatitis has a tendency to develop into a gangrenous type unless the patient has the proper hygienic care and diet. Gangrenous stomatitis frequently exhibits symptoms similar to those of noma. Nicotinic acid administered in the doses mentioned controls the stomatitis of either the gangrenous or the ulcerative type and the complicating Vincent's infection. Twenty-four cases are reported as occurring in children from 2 to 15 years of age. Good results were obtained in all.

- Cervical Ribs and Scalenus Syndrome L Rogers—p 541

**Cervical Ribs and Scalenus Syndrome**—According to Rogers cervical ribs which can be palpated or visualized in roentgenograms, as a rule, do not exert pressure on the brachial plexus. Symptoms similar to those caused by nonpalpable compressing ribs are observed in the scalenus syndrome in presence or in absence of a rudimentary or a noncompressing cervical rib. The scalenus syndrome is caused by compression of the brachial plexus by a band of fibrous tissue which, in the absence of a compressing cervical rib, occupies the anatomic plane which would be occupied by the latter if it were present. This band may represent the prolongation of a rudimentary or of a noncompressing cervical rib or of the middle scalenus muscle. In the first instance the band originates in the rudimentary rib and is formed by nonossified tissue. In the second instance it consists of the anterior tendinous fibers of the middle scalenus muscle. The anterior scalenus muscle may play a role in the production of the syndrome by compressing the lower portion of the brachial plexus and the subclavian artery against the band which is the main causal agent of the syndrome. Symptoms of the scalenus syndrome are transient in the beginning and constant in time. They are predominantly neurologic and consist of pain in the shoulder area which radiates into the neck and down the arm of sensory disturbances along the forearm and of neurovascular disturbances in the hand and the forearm. These symptoms can be differentiated from symptoms caused by a lesion of the cubital nerve by subacromial bursitis or by laceration of the supraspinatus tendon by the character of pain and especially by the diminished tone and weakness of the small muscles of the hand. They abate when the arm is placed in abduction in an airplane splint. Their abatement in abduction is a sign of diagnostic value and an indication for surgical intervention. The treatment consists in sectioning the anterior and the middle scalenus muscles and the fibrous tissue band. The cervical rib if present is removed. A sharp edge of the first rib must be converted into a depression. The phrenic nerve is carefully isolated and protected before the anterior scalenus muscle is cut. The posterior scapular artery is sectioned between ligatures if it originates in the third segment of the subclavian artery. Before closing one must be certain that the brachial plexus is entirely free from any compression.

- \*Elimination of the Sulfonamides Through Milk R Cibils Aguirre, J R Calcarani, D Aguilar Giraldes and H M Berisso—p 621  
Hereditary Syphilis in Children E P Navarini—p 651  
Varicose Veins Social Problem L G Gret—p 666

**Elimination of the Sulfonamides in Milk**—Cibils Aguirre and his collaborators determined the elimination of the sulfonamides in the milk and in the blood of 49 women in the course of the puerperium. They also made sulfonamide determinations on the blood of 34 newborn infants of these mothers. Bratton and Marshall's technic was used with a slight modification. The patients were placed in seven different groups and were given the following sulfonamide preparations in the usual therapeutic doses: sulfathiazole, sulfadiazine, acetylsulfanilamide, dimethyldisulfanilamide, sulfanilamide, sulfapyridine and monomethyldisulfanilamide. Specimens of the blood and milk of the mothers were taken within fifty-two and fifty-three hours after administration of the first dose. Milk for the determinations was taken before and immediately after nursing. Blood was taken from infants an hour and a half after administration of the last dose of the sulfonamide to the mother. The sulfonamide concentration was higher in the milk than in the blood when the drug administered was acetylsulfanilamide, sulfapyridine or sulfathiazole, with the other drugs it was lower. The sulfonamide concentration in milk was higher in the first week after the puerperium than in the days following. The concentration of conjugated sulfanilamide was higher in the milk than in the blood when the drug used was sulfanilamide. The concentration of the drug in the milk in relation to that in the blood when other sulfonamide preparations were administered was in decreasing amounts. The milk showed traces only when dimethyldisulfanilamide was given. The amount of sulfanilamide in the blood of newborn infants nursed by mothers in the course of sulfonamide therapy was nil or almost nil. Infants nursed by mothers or wetnurses in the course of sulfonamide therapy do not exhibit toxic symptoms. The author concludes that (1) administration of the sulfonamides to women in the course of the puerperium does not contraindicate lactation, (2) sulfonamide therapy for infants by administration of the drug to the mother or wetnurse is inadequate because the amount of drug eliminated in milk is negligible for therapeutic purposes.

\*Treatment of Burns with Cod Liver Oil or Tannin Attempt at a Comparison R Gey—p 287

**Spirochetes in Duodenal Juice in Weil's Disease**—Jahn and Ludwig report the history of a soldier who had bathed in rat infested waters and who subsequently had severe headache, jaundice, conjunctivitis, an enlarged, extremely painful liver, cutaneous hemorrhages over the abdomen and pains in the calves of the legs. Dark field examination of the urine, blood, saliva and conjunctival secretions disclosed spirochete-like bodies in the blood only. The authors examined the duodenal juice with dark field illumination and found numerous motile, corkscrew-like organisms. Irrigation of the duodenum with magnesium sulfate resulted in an increase of spirochetes under observation. Duodenal aspirations were repeated every second day and always gave the same results up to the twentieth day, when the spirochetes were no longer detectable. Serologic tests corroborated that the spirochetes were those of Weil's disease. The object of reporting this case was to induce the use of dark field examination of the duodenal juice in cases of Weil's disease. In doubtful cases of jaundice this method might be an aid in clarifying the diagnosis.

**Sympathectomy for Causalgia**—Fuchs observed 8 cases with gunshot injuries of the extremities presenting symptoms of causalgia (a term first used by Weir Mitchell). The condition presents the following symptoms: (1) There is a pain which burns, pierces, draws and tears, (2) the pain cannot be influenced by analgesics, (3) it is elicited by tactile irritation in the involved region, (4) there is a synesthesia which the patients in this group designated as transmission pain (touching the left arm or the head intensifies the pain in the right palm), (5) attacks of pain are elicited by sensory stimuli such as intense light or noises, (6) psychic experiences are transformed into pain sensations, thus pain may be originated by excitement or by anticipation of being touched, (7) synesthesia, that is, touching of the dry skin or touching the skin with dry fingers causes pain, also the putting on of rough socks, the touch of paper or starched linen, (8) the patient tries to prevent elicitation of pain by using substances which will facilitate gliding (wet stockings or gloves, moistening of the hair, application of petrolatum), (9) there is pain on movement, (10) there is algogenic or algophobic akinesia. The previous history did not indicate unusual sensitivity to pain, it was not detected among 178 men with gunshot injuries of nerves. However, the syndrome may develop when the peripheral nerves are not involved. Causalgia occurs in probably 1 per cent of gunshot injuries of the extremities when the injury involves an afferent, direct, continuous sympathetic nerve. Apparently these nerves are not uniformly capable of pain conduction and this probably explains why identical injuries cause causalgia at one time and not at another. Causalgia is not widely known. Several of the author's cases had been diagnosed by others as neurosis or hysteria. The grotesque manner in which patients will sometimes try to protect themselves against a recurrence of pain leads readily to the diagnosis of hysteria. Section of the sympathetic nerve and of the first lumbar and second sacral ganglions, or of the stellate ganglion and the first and second thoracic ganglions is advisable only after the diagnosis of neuritis and of neuralgia have been ruled out. Sympathectomy should not be postponed for too long.

**Cod Liver Oil or Tannin in Treatment of Burns**—Gey compares the cod liver oil with the tannin treatment of burns. He applied sterile cod liver oil bandages without previous disinfection to burns of every degree. Some severely burned extremities were immobilized in plaster casts. Tetanus antitoxin and vitamin C were given to all patients. At a city hospital physicians employed tannin treatment. The patients were anesthetized, the burned area was cleansed with soap and benzene and alcohol. After being dried with warm air the area was sprayed with a 5 per cent aqueous solution of tannin and sprayed with a 10 per cent silver nitrate solution. The hands were splinted, the face was not bandaged. Tetanus antitoxin was administered. Cod liver oil proved satisfactory in every respect. It could be applied to all wounds and its application was considerably less complicated than the tannin treatment. If large numbers of patients have to be treated the cod liver oil method is best. Tannin treatment has its advantages. It is apparently preferable for burns of the face and tages. It is apparently preferable for burns of the face and has a greater analgesic effect, but it has the disadvantages that it requires anesthesia and can be used advantageously only in first to third degree burns, not on fourth and fifth degree burns. The decision as to the degree of burn that exists is not always easy.

\*Transverse Myelitis After Mumps D N Bobeff and C I Berman—p 331  
Establishment of Vitamin C Requirements in Infants and Small Children A Iancu, C Opris and V Jula—p 337  
**Sulfapyridine in Treatment of Epidemic Meningitis**—A group of 11 children comprising 1 infant, 4 between 1 and 4 years of age and 5 between 4 and 14 years with epidemic meningitis, were treated with spinal fluid azosulfamide or septasin, endolumbar irrigations and transfusions. Of these 11 children 5 died.

21 patients, comprising 6 infants, 9 small children and 6 older children, was treated with sulphyridine and some of these with blood transfusions. One infant and 1 older child died, giving a mortality rate less than 10 per cent. A third group comprised patients who either remained without treatment because they arrived at the hospital in a moribund condition and died within the first twenty-four hours or were treated only by spinal puncture. Of this group of 13 all 7 infants and 4 small children died, 2 children both aged 14 years, recovered completely without treatment. Widenmann concluded that sulphyridine therapy is the most effective in epidemic meningitis.

**Transverse Myelitis After Mumps**—Bobeff and Petroff believe that the virus of mumps has an affinity for the central nervous system. Its involvement varies according to different statistics between 1 and 10 per cent. Meningitis is one of the most frequent complications of mumps involving the central nervous system, but neuritides leading to impairment of the abducens, the acoustic or the optic nerve have been observed. Encephalitis or encephalomyelitis is extremely rare. The authors report the history of a girl aged 6 years who had, ten days after an attack of mumps, symptoms of a transverse myelitis of an area corresponding to the third dorsal segment and three days later of an area corresponding to the eighth cervical segment with meningeal symptoms. The impairment of the upper extremities subsided, but the paralysis of the lower extremities persisted after two years. The authors believe that the virus of mumps caused an inflammatory process in the spinal cord.

- \*Role of H Substances in Cutaneous Inflammations F. Voss—p. 695

**Roentgen Irradiation in Cancer of Gastrointestinal Tract**—Chaoul and Neumann discuss close range roentgen irradiation of intestinal carcinoma. The approach to the rectal carcinoma was originally produced by surgical intervention and the results left no doubt as to the efficacy of the method. Nevertheless it seemed desirable to restrict the time consuming and hazardous surgical procedures. The utilization of special endoscopic tubes for intrarectal irradiation appeared feasible because of the structural character of close range x-ray tubes. The first attempts with the 'peranal' irradiation were made on patients with low rectal carcinoma, in whom surgical intervention was inadvisable because of advanced age, impaired general state or the concomitant disease. The newly developed pointed anode tube, with its conical antikathode, which emits rays in all directions and with its small anode shaft, made it possible to approach cancers of higher localization. Whereas in the exteriorization method the artificial anus was necessary, in the peranal method the question of its advisability must be considered in each case. Although the artificial anus facilitates irradiation (greater cleanliness, better survey and more rapid improvement of inflammation), a number of patients could be treated successfully without the abdominal anus. In extensive cancers an artificial anus cannot be avoided. Irradiation must be continued until the tumor has disappeared. To depart from this principle would mean to nullify the partial success. The authors employed close range roentgen irradiation in the treatment of 131 patients with gastric or intestinal carcinoma, of whom 125 had carcinoma of the rectum and in 65 of whom the treatment was completed. In 35 surgical exposure preceded the close range roentgen irradiation, of these 5 died intercurrently and, of the remaining 30, 14 were cured and 16 were not. Of the 30 patients treated by the peranal method without previous surgery 2 died intercurrently and of the remaining 28 patients 20 were cured and 8 were not. The authors regard it as strange that experienced surgeons advise against irradiation

as having no prospect of success. This is the more surprising because results of surgical procedures in intestinal carcinoma have been disappointing and have not shown much improvement during the last decade.

**Role of H Substances in Cutaneous Inflammations**—Voss points out that the numerous reactions which constantly take place in the human organism and which are necessary for its maintenance, growth and defense are elicited and regulated by a complicated system of endocrine and exocrine glands, autonomic nerve centers and tracts, and active substances which appear in the intermediate metabolism in the form of decomposition products of protein. Few of these substances are known and little is known about their action because they are present in extremely small quantities and because they decompose rapidly. The best known of these is histamine which plays an important part in inflammatory processes, especially in allergic inflammations such as urticaria and eczema. The results of his experiences support the assumption that, in the experimentally irritated, inflamed and burned skin as well as in the skin diseased by inflammatory dermatoses, H substances are formed as the result of increased metabolic processes and accelerated protein decomposition. Determinations of the gastric juice made it possible to discover a certain system in the behavior of the gastric secretions in the course of cutaneous disorders. In animal experiments cutaneous irritations and burns produced analogous results and thus demonstrated that the disturbances in the gastric secretion are dependent on the duration, extent and intensity of the inflammatory cutaneous irritations. The observation that prolonged cutaneous irritation and chronic skin diseases lead regularly to a decrease in acidity had not been reported before. That the same gastric disturbances appear when in the animal experiment the cutaneous irritation is replaced by the administration of histamine further supports the opinion that in cutaneous inflammations the H substances are liberated as active agents and that they are of fundamental importance in the metabolism of inflammation.

**Cancer in Asbestos Workers**—Linzbach and Wedler report the history of a man aged 61 who worked in an asbestos factory from 1921 to 1939. He was exposed to the inhalation of large amounts of dust during the first three years and had exhibited mild symptoms of asbestosis. A number of roentgenograms taken during 1934 and in the following years revealed the progressive development of pulmonary fibrosis. This observation suggests that once asbestos dust has entered the lung it may cause a progressive pathologic change. The roentgenograms taken during the last year of the patient's life suggested a malignant condition. A postmortem examination established the existence of cancer of the lung. A period of fifteen years elapsed between the development of asbestosis and that of cancer. Other cases in which cancer of the lung followed asbestosis likewise occurred at comparatively long intervals. The asbestos fibrosis produces a local disposition for the development of cancer. It is not certain, however, whether another chemical or mechanical factor is essential. Theoretical discussions are of little importance in deciding whether cancer of the lung is to be regarded as an occupational disease in asbestos workers. Cancer does frequently concur with asbestosis. A mechanical action of asbestos dust cannot be denied since it is inconceivable that the long, pointed asbestos needles particularly of hornblende asbestos, which are not readily dissolved can be tolerated by the constantly moving lung without causing mechanical lesions. The more easily soluble needles may cause chemical lesions by the action of silicic acid.

## Book Notices

**Psychological Effects of War on Citizen and Soldier** By R D Gillespie, M.D., Physician for Psychological Medicine, Guy's Hospital, London. Cloth Price, \$2.75 Pp 251 New York W W Norton & Company, Inc., 1942

This is a compendium of the Thomas W Salmon lectures given in 1941 by the author, a prominent English psychiatrist, who holds the post of wing commander in the Royal Air Force. As is often true of such compendiums, this is an interesting, clearly written, sincere but uneven work. The first chapter is an able statement of Gillespie's conviction that many acute "neurotic" symptoms, especially those which develop in civilians and soldiers under the emotional stresses of war, are within reach of conscious control and therefore may be treated effectively by relatively simple and direct methods. While this thesis is undoubtedly true, it does not, as the author implies, furnish adequate grounds for the rejection of a deeper psychodynamic etiology of the neuroses. Gillespie's arguments go further afield when he tries to prove a "constitutional" basis for war neuroses by citing small series of adult neurotic persons who are vaguely reported as having been "nervous in childhood," with the result that the reader is confronted with statements like these

"Certain physical factors appear from these figures to favor the development of some form of psychoneurotic reaction in war, such as, age over 30, height and weight above average, generally poor physique and a record of illnesses other than neurasthenia before service. The general psychological factors favoring breakdown, at any rate in these people, were marriage, skilled or clerical occupations and exemplary conduct, or, in other words, if you are unmarried, unskilled and rather a 'bad egg' you are less likely to develop a war neurosis, at any rate of the chronic sort."

Similarly, Gillespie's tendency to class consciousness will be foreign to most American readers, who might be disconcerted to learn that "desires and repressions are apt to be less" in poorer economic groups or that "well-to-do parents may be supposed to be among other things the most intelligent. While the middle class may be less ambitious and, on the whole, more secure, the poorest parents have either never been competitive or have become reconciled to their lot."

The author reaches firmer ground in the second part of his book, in which he discusses, with the authority of able and intensive observation, the symptomatology, diagnosis, prevention and treatment of neuroses in the civilian and military population. Here he reveals, by case history and brief exposition, his sound recognition of the fact that "war neuroses" in children and adults do not constitute clinical entities but must be understood dynamically as instances of psychologic maladaptations of individual persons to their special war experiences. Gillespie's final chapter on human relationships in the post war world is a sober and inspiring piece of sociopsychiatric writing.

The volume is recommended to psychiatrists, sociologists, psychologists, social workers and others concerned—and who is not?—with the vast problems that can be marshaled under its title.

**Athletic Injuries Prevention, Diagnosis and Treatment** By Augustus Rhoads M.D. Surgeon in the Department of Hygiene Harvard University Boston. Second edition. Cloth Price \$3 Pp 216 with 105 illustrations Philadelphia Lea & Febiger 1942

The book is divided into three parts: (1) the prevention of injuries in athletics, (2) the more common types of athletic injuries and (3) the more common regional injuries. A review of the athletic medical history of Harvard shows great improvement in the prevention and treatment of injuries. In 1908, when proper headgear and equipment were required to be worn for the first time, there were only 3 cases of concussion. In 1905 there had been 19. A chapter on physical fitness takes up the cardiovascular and respiratory systems, the central nervous system and certain chemical and physical changes contributing to the efficiency of the trained athlete. The author

concludes that the healthy heart is not damaged by athletic activity. The four main features of proper training are diet, graduated muscular exercise and the absence of all drugs. To maintain weight in the average athlete of college age a diet of 5,000 to 6,000 calories is necessary in football and cricket, somewhat less in hockey, track and baseball. At least eight and one-half hours of sleep is recommended for any athlete of college age. Physical fatigue is considered scientifically regarding chemical studies. "Pep pills," as the administration of sugar, gelatin or vitamins, have not been proved to be of use in dispelling fatigue. "Overtraining" is not a matter of physical fatigue but rather of mental fatigue and should be treated by vacation or break in the monotonous routine of daily practice together with an adequate period of physiologic rest. Various injuries are discussed under the heading of sprains, strains, contusions, fractures and dislocations, internal injuries, infections and inflammations, lacerations and abrasions. Statistics on parts injured agree with those of previous writers including Lloyd, Deaver and Eastwood, and Hobart. The head is still the most vulnerable location, with the ankle second. The rest of the book deals with the diagnosis and treatment of various injuries and would make an excellent work of reference. The book is well organized, scientific and attractive. It has many good illustrations and should be a useful addition to the library of doctors, coaches, trainers and others who have to do with the care and supervision of athletes.

**Neural Mechanisms in Poliomyelitis** By Howard A. Howe, M.D., Associate in Anatomy, The Johns Hopkins University Baltimore and David Bodian, Ph.D., M.B., Assistant Professor of Anatomy, Case Reserve University, Cleveland. Cloth Price \$3.50 Pp 331 with 111 illustrations New York Commonwealth Fund London Oxford University Press 1942

Recent important studies on poliomyelitis which have been carried on in the department of anatomy at the Johns Hopkins School of Medicine have been summarized in this volume. They deal largely, as the title suggests, with neuropathology, but the author and the reader cannot help but be drawn into consideration of the wider implication of their observations. Consequently the book is not to be regarded as a neuroanatomical treatise, for (with certain recognized limitations) it is concerned with the whole problem of the pathogenesis and clinical infection in poliomyelitis in the clinical as well as the experimental disease. In other words, as T. M. Rivers points out in his foreword of this volume, the technique presented is that of the "neurobiologist." Essentially the experiments deal with the anatomic distribution of poliomyelitis lesions which have been experimentally produced within the central nervous system under a variety of different conditions, but the experiments are also concerned with the selective action or tropism of the virus has for living and injured nervous tissue. Illustrative of the approach we find, in chapter 2, not only a series of interesting experiments performed on rhesus monkeys demonstrating the circumstances under which the poliomyelitis virus travels along the intact nerve and its subsequent travel along the freshly injured nerve. In describing these phenomena the author indicates that the virus is not neurotropic but neurocytotropic or neuronotropic. Many previous investigators in this subject, however, have not limited themselves to the study of one strain of poliomyelitis virus and one species of monkey; they point out the dangers of drawing clinical conclusions on the basis of experience with one variety of monkey. They also point out the many variables which enter the picture as soon as multiple species of monkeys are used and as many strains of virus are used, they even go so far as to use chimpanzees. In fact they are the only group of monkeys which have used a large series of these animals in experimental poliomyelitis work. In their series of chimpanzees they succeeded in producing the experimental disease by a variety of different routes, and they compare and discuss their findings (at necropsy) with the findings in human necropsies. This comparison would seem to be a valuable contribution to the history of poliomyelitis, and rather than urging one to read the original text

**Glandular Physiology and Therapy** A Symposium Prepared Under the Auspices of the Council on Pharmacy and Chemistry of the American Medical Association. Reprinted from The Journal of the American Medical Association. Fabrikoid. Price \$2.70. Pp 571. Chicago: American Medical Association 1942.

This is the third revision of this excellent book which appeared first in 1924 as a series of articles under the auspices of the Council on Pharmacy and Chemistry of the American Medical Association. They were published in book form the following year and revised in 1927 and 1935. In Dr Morris Fishbein's introduction to this 1942 edition he gives as one of the reasons for publishing the original series of articles the need to combat a "pseudoscientific therapy" which existed at the time and was based on the use of many glandular products for which pharmaceutical manufacturers made great claims. This type of therapy has now largely disappeared but there is still an urgent need for a reference book in which clinicians may find authoritative information as to the normal physiology of the glands of internal secretion, their dysfunction and the most acceptable therapy. *Glandular Physiology and Therapy* fills this need admirably.

The present edition is somewhat longer than the preceding one. There are thirty-one chapters as in the previous edition but some material has been omitted, some chapters are combined and new chapters have been added. Some of the new chapters deal with the subject of antihormones, the role of the anterior lobe of the hypophysis in intermediary metabolism, the adrenogenital syndrome and the clinical significance of hormone assays. The results of recent investigations have been added to bring the book as nearly up to date as possible in such a rapidly expanding field as endocrinology.

The thirty-five contributors, who are authorities in their respective fields, are to be highly commended for putting a large body of complicated information into clear, concise and readable form with a minimum of repetition and overlap. This book can be recommended as an invaluable aid to clinicians and to research workers in experimental endocrinology.

**Diseases of the Thyroid Gland Presenting the Experience of More Than Forty Years** By Arthur E. Hertzler, M.D., Professor of Surgery in the University of Kansas. Lawrence. Cloth. Price \$8.50. Pp 670 with 495 illustrations. New York & London: Paul B. Hoeber, Inc. 1941.

Dr Hertzler states in his preface that this book is 'in no wise a treatise on the thyroid gland'. It is merely a record of his observations and studies which now extend 'over a period of nearly fifty years'. He discusses in detail the morphology, the pathology and the goiter of childhood, adolescence and adult life, including the nodular hyperplastic, chronic inflammatory and neoplastic changes in the thyroid gland. There are also chapters on the author's personal methods of hospital management of goiter patients, hepatic insufficiency in toxic goiter, operative technique and postoperative course. Hertzler advocates total thyroidectomy for all goiters and claims that myxedema is relieved by such an operation. The lack of uniformity of histologic states as correlated with the clinical picture is emphasized in the sections on the surgical pathology, the importance of the stage of the disease is stressed, also the fact that large cancers grow from small adenomas. The volume is profusely illustrated with clear and well chosen photographs of patients, gross specimens and photomicrographs. The style, while by no means orthodox, is entertaining. All in all, this is a distinctly worthwhile book, containing much instructive material.

**Illustrations of Bandaging and First Aid** Compiled by Lois Oakes, S.R.N., D.N., County Organiser for the Civil Nursing Reserve, Cambridge, England. Second edition. Cloth. Price \$2. Pp 256 with 111 plates. Baltimore: William Wood & Company 1942.

The author is a well qualified nurse and the methods of bandaging are clearly illustrated. Sections 1 and 2 of the book cover the large number of methods of applying the triangular and roller bandages. By means of photographs the author offers the beginner in first aid an opportunity of studying the various techniques of applying bandages. Sections three and four devoted to first aid in cases of hemorrhage and fractures, are not as clear as necessary for a beginner. A nurse or a physician would find those two sections simple and comprehensive, but a lay person anxious to learn first aid would not readily grasp the suggestions set forth.

**The Roentgen Density of the Cystine Calculus** A Roentgenographic and Experimental Study Including a Comparison with More Common Uroliths. By Axel Renander. Translated from the Swedish by Catherine Djurklou. *Acta Radiologica Supplementum* XLI. Paper. Price 15 Swedish kronor. Pp 148 with 67 illustrations. Stockholm: P. A. Norstedt & Söner 1941.

In this small monograph Renander has reviewed in characteristically thorough fashion all the available literature on the development of cystine calculi in the urinary tract and has added his own clinical and experimental observations. He reviewed all the known 37 cases of cystinuria in Sweden, 27 of which were complicated by the formation of calculi. By means of the photometric studies of the roentgenograms of various urinary concentrations including cystine stones made under various conditions he concludes that all cystine calculi should give a density sufficient to produce a clearcut shadow in the ordinary roentgenogram. In 15 of the 18 cases of his series in which adequate roentgen examinations had been made the shadows were clearly visible. In 3 of the cases very small stones could not be distinguished in the roentgenogram but this was probably due to overlapping intestinal shadows. Excellent description of the roentgenographic characteristics of cystine calculi are detailed. A proper experimental method for the study of the roentgenographic density of urinary calculi is described. The author calls attention to the value of the photometric method even in the practical differential diagnosis of urinary concretions. This supplement to the *Acta radiologica* should be of great interest to any one concerned with the problem of urinary calculi.

**Play for Convalescent Children in Hospitals and at Home** By Anne Marie Smith. Staff Instructor, Leaders Training School, Community Recreation Service, Chicago. Cloth. Price \$1.60. Pp 133. New York: A. S. Barnes & Company 1941.

Resulting from six years of experimenting with play for children under treatment at the children's Memorial Hospital in Chicago, this book is of vital interest and importance. The contents give one a good idea of the completeness of this study, new attitudes in using play, the value of traditional play activities, organization and administration of the department of play, play activities and their use, suggestions for gifts of play equipment for children in a hospital and classifications of tested forms of play. There can be no doubt in any of the conclusions drawn from such a thorough study as this. The play department should be an integral part of every children's hospital and every hospital having a children's ward. The principles of play, cooperation with children and the selection of toys and books are laid down and supplemented by ample illustrations, examples and tales. What goes for a sick child goes for a well one too. The conclusions, instructions and suggestions are valuable not only to doctors, nurses and play directors but to parents, relatives and friends. No doubt the war has put a kink in the development of many a hospital's play department. Women now graduating from the current Red Cross courses should find ample outlet for their energy as volunteers in the hospital play departments after the war is over.

**Aids to Obstetrics** By Leslie Williams, M.D., M.S., F.R.C.S., Consulting Obstetric Surgeon to Queen Charlotte's Hospital, London. Eleventh edition. Cloth. Price \$1.50. Pp 238 with 10 illustrations. Baltimore: William Wood & Co. London: Baillière Tindall and Cox 1942.

This tiny book, which may easily be carried in a coat pocket, contains practically all the essential facts about obstetrics. That physicians in England realize this is proved by the fact that the book has gone through eleven editions. The material is arranged in the more or less traditional manner of writing textbooks of obstetrics. Throughout the book the author indicates his conservatism. He advises against cesarean section in eclampsia, advocates manual rotation of the head in cases of occiput posterior and warns against rotation of the head with forceps by physicians with limited experience. He considers rupture of the membranes as the safest and most satisfactory method of inducing labor. The reviewer objects to the author's recommendation to squeeze the uterus like a lemon if the placenta fails to separate from the uterus within an hour. The Crede method of expressing the placenta should be discarded, because it is not only dangerous but also unnecessary. The book can be highly recommended to all who desire to have a brief outline of obstetric knowledge.

## Queries and Minor Notes

### TREATMENT OF PARALYZED URINARY BLADDER

To the Editor—What is the accepted treatment of paralysis of the bladder whether an indwelling catheter is left in the bladder or not?

M. D., South Carolina

ANSWER—Treatment of the paralyzed bladder is largely influenced by the etiologic factors present and by the site of the spinal lesion. With complete destruction of the spinal paths by injury, the best way of handling urinary retention would be to permit the development of an overflow bladder if possible. However, development of an overflow bladder may be difficult, and in some cases catheter drainage will be necessary. Furthermore, it may be difficult to determine the extent of spinal injury until some time has elapsed. If there is only partial destruction, the vesical function may return to normal gradually. Under such circumstances, return of function would be better insured with catheter drainage than by development of an overflow bladder.

The objection to either catheter drainage or suprapubic drainage is the secondary infection with resulting ascending pyelonephritis. However, by employing modern aseptic precautions, and with the aid of sulfonamide therapy, serious infection can in many cases be prevented. Where these precautions are available, this procedure may be best in many cases. On the battlefield, catheter drainage should be postponed if possible. Tidal drainage, as suggested by Monroe, has been successfully employed in some cases but its maintenance is not easy.

In many cases of paralysis of the bladder, transurethral resection of tissue from the bladder neck has been followed by elimination of residual urine and improved vesical drainage.

### MILIA OF THE SCROTUM OR SEBACEOUS CYSTS?

To the Editor—A man aged 23 has lymph nodules on the scrotum. These are numerous and vary in size from that of a wheat grain to that of a large split pea, there is no discharge and no pain. Apparently the patient is healthy except for obstinate constipation. He is 5 feet 7 inches (170 cm) tall and weighs 110 pounds (50 Kg). Blood tests give negative results. What can be done for him?

J. R. Heath, M.D., Grover Hill, Ohio

ANSWER—One could wish that the correspondent had given more detailed information about the character of the lesions. Without such details the correct diagnosis is one for conjecture.

Two possibilities come to mind, of which the first is milia. Milia are small whitish tumors of the skin formed by the accumulation of inspissated sebum beneath the horny epidermis. The lesions are familiar as the small, white masses which are seen frequently on the cheeks below the eyes. They occur as firm, white or yellowish papules usually of the size of a pinhead, which are superficial and whose content can readily be pressed out after incision. They are found most frequently around the eyes and on the cheeks and forehead but may occur elsewhere. Frequently they are seen on the scrotum, and they may occur on the penis. After reaching the size of a pinhead, or a little larger, they usually remain stationary. Occasionally they become as large as a small pea. They are ordinarily few, but at times they occur in large numbers. As a rule they remain discrete, but the lesions may coalesce into masses the size of a pea or perhaps larger. The larger lesions are usually yellowish or dirty yellow, and they may become hard from the deposit of calcareous salts, chiefly calcium phosphate and carbonate, forming so-called cutaneous calculi.

Milia are common in young adults, especially in association with comedos. They are not infrequent in nursing infants on the face, and occasionally they are present at birth. They are sometimes produced as a result of other lesions of the skin, as at the site of pemphigus bullae, in scars and after inflammatory processes like erysipelas. They are a constant accompaniment of lymphangioma tuberosum multiplex.

After incision the lesions are cleaned out by a little pressure, and the sac may then be touched with phenol (carbolic acid) or tincture of iodine to prevent recurrence.

The second possibility is that the lesions are sebaceous cysts. Sebaceous cysts occur as rounded or oval, sharply defined tumors situated in the corium or subcutaneous tissue. They vary in size from that of a small pea to that of an egg or larger and are not lobulated. They are firm, of about the consistency of adipose tissue, and are movable. The skin over them is normal, although it is stretched and glistening and is usually devoid of hair. The duct of the enlarged gland may remain patulous so that the contents of the tumor can be expressed, but frequently

this opening is entirely obliterated and the tumor is in a closed capsule. The tumors are usually single, but they may be multiple, and rarely they are numerous. They may occur on any part of the body but are most frequent on the head, especially the scalp, and on the neck, the back and the scrotum. They grow slowly and after reaching a certain size may remain stationary for years. From their prominence they are likely to be injured, and thus they frequently become inflamed. Occasionally they ulcerate spontaneously, and in old age they sometimes the site of development of cutaneous horns and epitheliomas. When the cyst is not large the contents may be pressed out through a small incision and the cavity treated with tincture of iodine or equal parts of phenol and glycerin.

### GOLD DENTURE AND POSITIVE WASSERMANN TEST

To the Editor—A single woman aged 31, while being examined for a marriage license, was found to have strongly positive Kohn and Wassermann reactions. Blood was sent to four different laboratories and was reported by all as strongly positive for syphilis. Examination revealed that the woman was a virgin, and no lesions were found. I am unable to determine the mode of infection. Could the presence of gold teeth in the mouth through absorption be a factor in the positive syphilis test? If you suggestions to offer regarding the possibility of kissing contaminated toilet seats or hereditary transmission in this case? Any information you may be able to give me will be appreciated.

M. D., Illinois

ANSWER—Gold is electronegative to approximately all the various other metals which are used in the mouth for dental restorations and is therefore not ionized and deposited in the oral mucosa, as sometimes occurs in infinitesimal amounts from electropositive metals. Therefore the possibility of absorption of gold even from a crude alloy of low karat dental restoration is so remote as to be eliminated from consideration.

Furthermore, gold has been given in amounts from 10 to 100 mg intravenously both in the treatment of certain skin and other diseases and for experimental purposes in syphilis, always with negative results.

There are numerous acute infectious processes such as pneumonia, scarlet fever, spotted fever, septicemia, lymphopneumonia, venereum and leishmaniasis which may sometimes produce a plus Wassermann reaction though only during the active stage of the disease. In a case of mononucleosis when doing a complement fixation test using sheep corpuscles, one may occasionally obtain a positive Wassermann reaction.

Extragenital contraction of syphilis from toilet seats is so remote as not to be considered. However, the incidence of infection with syphilis from scratches, abrasions, fissures on a part of the exposed body and kissing is a common cause recorded in the files of every experienced syphilologist and in every case of suspected syphilis this must be considered as a possibility.

Yaws, leprosy and generalized carcinosis may at times give a plus Wassermann reaction. Congenital syphilis usually gives a weak plus Wassermann reaction even as late in life as the age of this patient, but rarely a strongly positive reaction without other evidence of active lesions.

The inquiry implies that the patient otherwise appears to be in perfect health, therefore it is probable either that she substitutes an instance of asymptomatic hereditary syphilis or that she may have acquired syphilis extragenitally and passed through the primary and secondary stages with such mild symptoms that they were unnoticed.

### TYPHOID AND DYSENTERY NOT LARGE FACTOR IN BILE TRACT DISEASE

To the Editor—Is it the generally held opinion of most medical men who have studied gallbladder disease, especially chronic infections of the bile tracts, that (1) typhoid and (2) dysentery are diseases that alter the original and predisposing causes of bile tract disease in later life?

V. Heber Sergeant, M.D., St. Louis

ANSWER—It is not likely that typhoid and dysentery play any large role in the etiology of bile tract disease. In many instances the sequence of events is probably as follows: gallstones consisting largely of cholesterol form in the gallbladder chiefly as the result of a metabolic defect associated with increased excretion of cholesterol in the bile and one of those factors which keep this substance in solution in the biliary tract is due to stasis produced in the gallbladder. The changes in the gallbladder in acute cholecystitis are, however, not due to infection but to circulatory changes resulting from the tension caused by impaction of the cystic duct. The local destructive effect of the infection in the bile is also a factor in these changes.

## HYPOGLYCEMIA OR CAROTID SINUS HYPERSENSITIVITY?

**To the Editor**—A white married woman aged 19 fainted while bending forward and lifting a tray in a bakery where she was working. She was unconscious for one to two minutes. She was ordered to bed and had five more spells during the next forty-eight hours. She felt weak after each attack. I had a chance to observe one attack after which the patient was hospitalized. The attack lasted about two minutes; there was no change in pulse or respiration and there were no convulsions. The patient gave a history of having had fainting spells at varying intervals (one to four months) for several years. These attacks were always preceded by paresthesia in both arms. Sometimes they were accompanied by convulsions. At one time the patient took iodine for "internal goiter." The patient has one girl 11 months old and is still nursing her. Physical examination revealed that the habitus is asthenic, the weight 95 pounds (43 Kg), the blood pressure 102 systolic and 70 diastolic and the pulse rate between 52 and 58; otherwise the patient was normal. The blood picture was normal except for 40 per cent lymphocytes and 48 per cent polymorphonuclear leukocytes. Administration of  $\frac{1}{160}$  grain (0.001 Gm.) of atropine raised the pulse rate from 52 to 96. Pressure on the right carotid sinus for thirty seconds brought about paresthesia in both arms and dizziness but did not produce syncope. The blood sugar content was 68 mg. per hundred cubic centimeters. A dextrose tolerance test was performed to see whether it would produce the symptoms. None except headache were noted for six hours, although the blood sugar content was 62 mg. before the administration of dextrose and 58 and 44 after two and four hours respectively. An electrocardiogram was reported as normal. It was felt that the patient had carotid sinus hypersensitivity of the vagal type and tincture of belladonna was prescribed. While receiving belladonna in the hospital the patient had no more attacks. For the hypoglycemia a high carbohydrate diet with frequent meals was ordered in spite of the fact that most textbooks recommend a low carbohydrate diet. This doesn't seem to be reasonable because no change in the blood sugar content will be brought about in this manner while frequent meals should tend to keep the sugar on a higher level. Do you agree with my diagnosis and treatment? If not what would you recommend? Does this case come under the compensation law?

Mauro Rosenberg M.D. New York

**ANSWER**—The validity of the diagnosis in this case depends primarily on whether stimulation of the carotid sinus produced symptoms qualitatively identical with those occurring spontaneously. This is the most essential point in establishing this diagnosis. It appears that this requirement has been fulfilled. Perhaps more prolonged pressure on the right sinus or stimulation of the left side would have produced complete syncope.

If there was no well defined bradycardia during attacks, as stated the reflex involved must be the so-called cerebral type. Atropine is of no value in cases of this type. The hypoglycemia may have served to sensitize the cerebral reflex, as is sometimes the case. The attacks could hardly be on the basis of hypoglycemia alone, because of their short duration. (For further information see Capps, R. B. Practitioners Library of Medicine and Surgery, 1940, Supplement, p. 725.)

The data are insufficient for one to diagnose the cause of the hypoglycemia. In the majority of cases frequent feedings high in protein but low in carbohydrate are much more effective than a high carbohydrate diet. This is because sugar stimulates the secretion of insulin and so favors a low blood sugar content. Protein can be in part used as sugar in the body, but the release of sugar is slow, so that there is less stimulation to insulin production.

Treatment should be that for hypoglycemia, the cause of which it may be necessary to investigate further. The case presented probably does not come under the compensation law.

## BEHAVIOR OF BLOOD IN MASSIVE HEMOTHORAX

**To the Editor**—Our hospital group is organizing for medical home defense. We have speakers weekly who present topics on war medicine. In the last session we had a chest specialist cover injuries to the chest resulting from bomb concussion. He told us that in cases of massive hemothorax with shock the blood from the chest can be used for transfusion and the blood replaced by air. He stated that blood in the pleural cavity will not clot and that this cavity is the only one in the body where blood will not clot even if one has a pneumothorax. What is the physiology involved if an explanation is available?

M.D. Michigan

**ANSWER**—In cases of hemorrhage into the pleural cavity there is some delay in coagulation of the blood, but it is not true that clotting fails to occur. Any one who has had occasion to open the pleural cavity after a massive hemorrhage has seen clots of blood within the pleural space. In fact, if the blood is to be used for autotransfusion it is essential that it be filtered through several layers of gauze in order to remove the clots which are present. The blood that is poured into any of the serous cavities of the body is diluted quickly by a massive effusion of serum from the serous membrane. The dilution of the blood will delay the clotting and will result also in a suspension of a large number of blood corpuscles in the fluid exudate. When aspiration is performed and some of the exudate

is removed, it naturally gives the impression of unclotted blood. The conditions in the pleural cavity do not differ from those present in the other serous cavities, except that it is probably easier for a large effusion to take place in the pleural cavity than it is in the pericardial, the peritoneal or the joint cavities. The replacement of aspirated bloody effusions from the chest with air is an old procedure which was popularized during the first world war by Bastianelli, an Italian surgeon. The artificial pneumothorax, by keeping the lung collapsed, tends to diminish the amount of bleeding, which may otherwise occur from vessels of small or moderate size in the lung.

## DETERIORATION OF EPINEPHRINE BY CONTACT WITH RUBBER

**To the Editor**—In one of my textbooks I found the statement that epinephrine is made inert by contact with rubber. Is there any truth in this statement? At least one manufacturer puts up its epinephrine in rubber capped vials.

M.D. New York

**To the Editor**—If carried in a rubber capped vial will epinephrine deteriorate? Is there any danger in using epinephrine out of a rubber capped vial if the expiration date is not on the product? Is there any particular advantage in the ampuls of epinephrine over the rubber capped vials of epinephrine if proper sterile precautions are used?

M.D. Texas

**ANSWER**—The question of the deterioration of epinephrine hydrochloride solutions by contact with rubber has previously been considered by the American Medical Association Chemical Laboratory. It found that deterioration was due to the presence of certain substances employed in the manufacture of rubber, such as accelerators, dyes and lubricants. All reputable manufacturers of solutions marketed in rubber stoppered containers are cognizant of this difficulty, and they overcome it by carefully removing impurities from the rubber. The Council on Pharmacy and Chemistry requires a statement on the labels of all brands of epinephrine solution accepted for inclusion in New and Nonofficial Remedies warning against the use of solutions which show evidence of deterioration by discoloration or by the presence of a precipitate, despite the fact that nearly all contain an antioxidant to retard deterioration from exposure of the solution to light, heat and air. Solutions which show discoloration or precipitation are not necessarily dangerous but they are usually less potent. The injection of a solution from a multiple dose rubber capped vial appears to involve no special danger provided it contains, in addition to an antioxidant a bacteriostatic agent to protect against possible contamination from repeated use. From the standpoint of repeated exposure to accidental contamination the single dose ampul is preferable. Corked or screw capped multiple dose vials of the solution should be restricted to topical use. The Council recently voted to require both an antioxidant and a bacteriostatic agent in solutions of epinephrine regardless of the type of container in which they are marketed.

## MOCCASIN SNAKE VENOM AND STRYPHNON FOR TREATMENT OF THROMBOCYTOPENIA

**To the Editor**—Please tell where dilute moccasin venom can be obtained, the price of it and whether it is generally conceded to be of value in the treatment of idiopathic thrombocytopenic purpura. I would also appreciate your evaluation of stryphnon in this type of purpura.

M.D. Nebraska

**ANSWER**—Moccasin snake venom solution for use (principally by injection) in the treatment of hemorrhagic conditions is marketed by Lederle Laboratories, Inc., Pearl River, N. Y., and Sharp & Dohme, Inc., Philadelphia. According to the American Druggist Blue Price Book 1941-1942 the product is sold in 10 cc. vials by Lederle for \$2.63 and by Sharp & Dohme (1:3000 solution) for \$2.10. The question concerning the value of this preparation in idiopathic thrombocytopenic purpura is discussed in the report of the Council on the Lederle brand of snake venom solution (moccasin) declaring the product unacceptable for N. N. R. because the scope of its usefulness and its limitations have not been established satisfactorily. Stryphnon is the proprietary name used in Europe to designate the externally applied hemostatic agent sold in this country by the Alba Pharmaceutical Company, 80 Varick Street, New York, under the name Kephene Hydrochloride. The preparation has been accepted by the Council under the latter name as a vasoconstrictor agent for local hemostatic effects to arrest capillary bleeding. Obviously this preparation would have no systemic influence on thrombocytopenic purpura since it exerts no action on the clotting mechanism.

## SMALLPOX VACCINATION FOR PEMPHIGUS

**To the Editor**—Has smallpox vaccination ever been tried in the treatment of pemphigus on the supposition that it is a virus disease? It would seem to me to be a dangerous procedure because of the possibility of a generalized vaccinia or acute pemphigus following vaccination in the presence of cutaneous lesions

R P Little, M D, New York

**ANSWER**—Smallpox vaccination has been recommended for the treatment of pemphigus, as stated by the Suttons in their textbook. It would certainly appear to be a rather dangerous procedure on account of the possibility of multiple vaccinia due to autoinoculation. In extensive eczema of infants and young children, especially of the moist type, vaccination for smallpox is contraindicated, as fatal results have followed this procedure.

One dermatologist in New York has tried vaccination in 2 cases of pemphigus with generalized eruptions. Great care was taken to avoid autoinoculation. However, no improvement was obtained and there were fortunately no ill effects. No report of these cases has been published.

## ALLERGY TO FLAXSEED AND CORN

**To the Editor**—I am treating a man aged 27 who is in apparent good health except for asthma, which is present throughout the year and is not made worse in any particular season of the year. He is a dental mechanic running his own laboratory, and he had symptoms before engaging in this work. Initial cutaneous tests with the forty-three most common offenders reveal reactions as follows:

|            |      |
|------------|------|
| Dag dander | +    |
| Flaxseed   | ++++ |
| Corn       | ++++ |
| Buckwheat  | +++  |
| Wheat      | +    |
| Oats       | +    |
| Rye        | +    |
| Beans      | +    |

When he is pouring powders used in his laboratory his breathing becomes difficult. He has never required epinephrine for relief. What products for both domestic and commercial use are made from or contain flaxseed? Does the powder used (plaster of paris and pumice stone) constitute a mechanical irritant to the bronchi, or is it an allergen? Aside from removing the edible articles listed from the diet temporarily, how should one proceed?

Morton Silverman, M D, Allentown, Pa

**ANSWER**—A search of the literature reveals no reference to pumice stone or to plaster of paris as allergens and so they probably constitute mechanical irritants to the bronchi.

Among the possible offending agents in the dental laboratory are celluloid products, resin of various sorts for dental prostheses, e g acrylic, acetone for acrylic solvents, vulcanite, a rubber compound for dentures, hydrocolloidal substances for impressions, silicate in the various grinding stones, various powders for polishing, phenol, chloroform, ether, formaldehyde and cresol.

Flaxseed may cause cutaneous, gastrointestinal and respiratory disturbances. Flaxseed, karaya gum and quince seed are widely used for women's wave sets. Flaxseed meal is used as food for cattle, and the alleigic factor in it may be present in the meat or milk of these animals. Linseed oil is yielded from flaxseed and is used as a basis for paints and varnishes, in furniture polish and in the manufacture of linoleum, oil cloth, cork linoleum, patent leather, imitation leather, waterproof stuffs, carriage tops, oilskin, artificial rubber, printing and lithographic inks, soft soaps and carion oil for burns. Linseed oil is used in combination with slaked lime for preparing a cement for metals and is used in some depilatories and hair tonics, in linseed oil cake (after oil is extracted from flaxseed), as a feed for livestock and poultry, in tea, cough syrups and poultices and in breakfast foods (e g Roman Meal and Uncle Sam's Health Food) in association with flaked wheat and bran. Flax straw is used in refrigerator insulation, straw mats and rugs, fiber board, writing paper, high grade sack paper, shot shell paper and coarse stuffing materials for couches, car seats and carriage cushions.

Corn not only is used as a food but in the form of corn starch is widely used in the baking, cosmetics and other industries, it may possibly be used to coat dental equipment, just as lycopodium is used to coat rubber goods. The patient should by all means be tested for sensitivity to lycopodium.

To check the effect of inhalation of materials used in the dental laboratory, the patient should keep away from this place for about two weeks, if symptoms disappear only to reappear when he returns to work, something in the laboratory must be responsible rather than any food or house dust.

The use of a mask or respirator is strongly recommended.

## LEG CRAMPS IN PREGNANCY

**To the Editor**—Recently I addressed to Queries and Minor Notes a question concerning the etiology and treatment of leg cramps during pregnancy. In your answer a deficiency of calcium or vitamin D was given as the likely cause. This explanation frequently appears in textbooks, etc. I have not found an article in the literature dealing with this complication of pregnancy. In my practice I have looked on this complication as a symptom of nutritional deficiency probably related to the B complex. I have treated patients, with prompt relief, using small doses of nicotinic acid and thiamine hydrochloride. However, it helped me in my practice to consider leg cramps as evidence that pregnancy has placed too great a toll on the nutritional reserves of the body. This in turn leads me to place an increased emphasis on the patient eat an adequate diet and to reach a much better state of nutrition. Do you know of any article or work that has been done on this subject which I have overlooked in my cursory search of the literature?

Ferdinand Gaensbauer, M D, Pontiac Mich.

**To the Editor**—In Queries and Minor Notes in the March 21, 1942 issue of The Journal I note that there is no mention made of the use of thiamine hydrochloride in leg cramps in pregnancy. It is my opinion, as well as that of many others, that these cramps are a definite sign of nutritional deficiency. I have found that from 10 to 20 mg of thiamine hydrochloride daily will usually relieve this symptom completely, depending on the severity of the case. There is no question that thiamine hydrochloride has a definite place in the treatment not only of these symptoms but of the more severe symptoms of weakness and pains associated with pregnancy.

J W Carney, M D, Logan, W Va.

**To the Editor**—In the March 21 issue of The Journal I noticed the question and answer regarding "Leg Cramps in Pregnancy." May I add that I have found that giving the patient concentrated liver often prevents these cramps entirely and certainly helps to decrease them in most cases.

Richard N Pierson, M D, New York

**ANSWER**—The statement made in the answer is that there may be a connection between the cramps and lack of vitamin B and calcium. Likewise, we agree that there may be an association between the cramps and lack of vitamin B. There are in some cases vitamin D and calcium, and in other instances thiamine hydrochloride, may be helpful. Women who eat a well rounded diet which includes a sufficient supply of vitamins are not as prone to have cramps in the legs as those who are on diets that are deficient in vitamins. Richardson (Illinois M J 65 367 [April] 1934) considers cramps in the legs during pregnancy to be part of a symptom syndrome of tetany. Relief was obtained in Richardson's cases by the use of viosterol.

## TINCTURE OF IODINE IN OPEN WOUNDS

**To the Editor**—My attention has been called to an article by R N France, R N, in the issue of Public Health Nursing for March 1942. The article is entitled "The Skin is the First Line of Defense." In it states that tincture of iodine should be used in all wounds and that much should be used. It seems to me that it is poor practice to burn the tissues with such so called antiseptics.

J W Robinson, M D, Los Angeles

**ANSWER**—Medical and nursing journals are not to be held responsible for opinions expressed by contributing authors. Editors should not be expected to censor honest views on controversial subjects. In a living science there are few persons who can qualify as unquestionable authorities, but it is the genius of modern medicine that authoritative knowledge is shifted from individual persons to the corporate experience of the profession. The author quoted had a right to her views regarding the use of iodine in wounds, on the other hand readers have an equal right freely to accept or reject them. Views do not settle the matter, however. The practice of treating wounds with corrosive agents, such as tincture of iodine, unavoidably stands before the bar of cumulative experimental evidence and clinical experience, and (except perhaps as a preliminary to radical debridement) it is generally condemned by physicians. In such a case the interests of the public would be served not by prohibiting the advocacy of iodine in wounds but rather, as the correspondent suggests, by a policy of publicizing the demonstrable harmful effect of this method of treatment.

## GESTATION PERIOD AND SWEATING IN ORIENTALS

**To the Editor**—Early in 1942 the New Republic in an article by George Barker quoted "an Everest mountaineer" who said "I could understand the Japanese without knowledge of the fact that they gestated for only six months in the womb." Would you please comment on this statement? Is it true as John Gunther remarks in his "Inside Asia," that the Chinese do not sweat?

M D N Y

**ANSWER**—The gestation period of all human beings is about nine calendar (ten lunar) months. Any shorter period is abnormal and results in prematurity. The Japanese can form no exception to this. Their sitting position and "public acts of urination and defecation" are cultural, not biologic or racial characteristics. Chinese sweat, though not so freely as white people. Negroes. Histologically their skin shows fewer sweat glands.

## MINIMIZING THE AFTER EFFECTS OF ACUTE POLIOMYELITIS

A RATIONALIZATION OF THE KENNY TREATMENT

CHAIRMAN'S ADDRESS

PHILIP MOEN STIMSON, M.D.

NEW YORK

To pediatricians usually falls the care of poliomyelitis in its early stages. On them rests the responsibility of seeing that at the time when they are most effective those measures are taken which are best able to save a maximum of function from the ravages of the disease. It is well that the Section on Pediatrics of the American Medical Association should devote a little time to surveying what it is that can best be done and why.

At best, the treatment of poliomyelitis is as yet not satisfactory because there is no specific serum, drug or chemical which will unquestionably cure or prevent the ravages of the disease. All treatment must be directed along the lines of symptomatic relief, helped of course by a study of the pathologic condition.

For years the outstanding pathologic feature has been considered to be paralysis due to loss of function of peripheral motor nerves, but as a result of the painstaking life work of the remarkable Australian nurse Sister Kenny, and the recent studies of many medical research workers and clinicians more and more persons are realizing that there are factors involved in muscle dysfunction in poliomyelitis other than loss of innervation and that much of the conception of the treatment of the disease held by most clinicians until recently must be changed. It is my purpose in this paper briefly to give the reasons for the necessity of this change and to summarize the present day treatment of choice of poliomyelitis.

### CAUSES OF MUSCULAR DYSFUNCTION

The lesions in the spinal cord that occur early in poliomyelitis have been well known for some years. Those that affect the anterior horn cells can be classified under four headings: edema, perivascular infiltration, petechial hemorrhages and the additional direct effect of the virus itself on the motor neurons. The first three factors alter the nutrition of the nerve cells and presumably their function, but this effect is only temporary. The action of the virus on the neurons may be totally destructive, causing permanent loss of function, but on some of the anterior horn cells it may possibly cause only temporary damage from which complete recovery is possible. Certainly at autopsy,

on examination of a cross section of the spinal cord, it is not the rule to find complete destruction of all motor nerve cells in a given area, usually at least a few survive in an anterior horn. Just what proportion must be destroyed before there is a clinical evidence of loss of muscle function is not known. In patients dying of respiratory failure very early in an attack of poliomyelitis, examination of the spinal cord at autopsy frequently reveals a surprisingly extensive destruction of the anterior horn cells throughout the length of the cord, even though there may have been no gross clinical evidence of any weakness whatever in the arms or legs.

Studies on muscle physiology by Eccles and Sherrington and by Clark have indicated that each anterior horn cell in the spinal cord controls through its axon and collateral fibrils a group of muscle fibers which vary in number in the different muscles. The motor neuron with the muscle cells it supplies is called a motor unit, and there are many such in any given muscle. Those motor units whose neurons are killed in poliomyelitis are henceforth destroyed and cannot recover but it is probably rare to have all destroyed even in a small muscle. What happens to those that are not destroyed determines the end result of the injury to the muscle. The survivors in time may recover from the nonfatal influences on their respective neurons, but meanwhile pending the subsidence of the temporary pathologic conditions in the spinal cord, these muscle fibers are subject to other harmful factors, particularly spasm.

Muscles in spasm are usually tender and painful and show a more or less tonic state of contraction of the muscle fibers, often apparently of the entire muscle. An additional form of spasm is the visible twitching, or fasciculation which in the past has been considered of diagnostic significance as a probable precursor of paralysis. This consists in irregular contractions of the muscle fibers in groups of motor units and is presumably due usually to irritation of the anterior horn cells in the spinal column.

The causes of the more obvious spasm, that apparently involving an entire muscle or the greater part of it, are not clear. There are many theories at present, involving reflex action, irritation, circulation, inflammation and anoxia, which do not need to be gone into at this time. But whatever the cause, spasm certainly is constantly present in early poliomyelitis, being found in the muscles of the neck and the back, and in the hamstrings as well as in a variable number of other groups of muscles. It is found both in muscles most of whose motor neurons are definitely weakened or paralyzed and in those without any evidence of weakness.

Spasm causes dysfunction not only of the muscle that is in spasm but also of its antagonist, which may be overstretched and rendered noncontractile. For instance, spasm of the biceps affects the use not only of the biceps itself but also of the triceps. By oscillographic recordings of action currents Schwartz and

From the Department of Pediatrics, Cornell University Medical College.

Read before the Section on Pediatrics at the Ninety-Third Annual Session of the American Medical Association, Atlantic City, N. J., June 11, 1942.

Bouman of Rochester, N. Y., have recently proved that in the acute stage of poliomyelitis spasticity is found not only in the antagonists of weakened muscles but also in the weakened muscles themselves and furthermore in muscles elsewhere in the patient which show no clinical evidence of weakness.

Spasm is aggravated by pain and tenderness, by attempts at active motion, by forced immobilization as by casts and splints, also considerably by massage and by electrical stimulation. If untreated, muscle fibers in spasm may become hard and inelastic and may comprise the bulk of a muscle, eventually, some may show fatty replacement, others fibrous degeneration. Hipps also has described "stretch tears," or minute ruptures of bundles of muscle fibers due to the force of a slow, continued stretch. If spasm is allowed to persist, permanent contracture and further loss of function ensue.

As a result of these several factors, that is, the diminution of innervation, the presence of spasm, as already mentioned, and also because of muscle tenderness and pain, patients develop additional motor difficulties. There is a loss of ability to use muscles in proper relationship to one another and to the work to be done. This is called muscle incoordination by Sister Kenny and is illustrated by the substitution of an unsuitable or inefficient muscle for one that is weakened or in spasm. For example, when a patient has spasm of the intercostal muscles, he tries to breathe with his pectorals, with his sternocleidomastoids and even with the platysma in the skin of the neck.

A second difficulty consists of a physiologic block preventing the proper transmission of a nerve impulse from the central nervous system to a contractile or nonparalyzed muscle, a condition known in the Kenny nomenclature as mental "alienation." Here there is no persisting organic injury to the motor units but because of various factors the patient is unable to operate the motor neurons normally. Inhibition due to pain can cause "alienation," as can also spasm in an antagonistic muscle, or a temporary loss of function of the neurons due to pathologic factors in the spinal cord. Even after these influences have disappeared the "alienation" may persist, the patient having lost the power of accustomed control over the particular motor units involved.

Thus, to recapitulate, there are several causes of muscular dysfunction in poliomyelitis. First, a primary loss of innervation, with resulting actual paralysis, second, spasm of the surviving fibers in the involved muscle or in an antagonistic muscle, third, muscle incoordination, and, fourth, mental "alienation." Of these factors, only the first is irremediable and permanent. Destroyed motor units remain destroyed, and no newly formed or regenerated muscle cells will appear. Occasionally practically all the motor units in a particular muscle may be so involved, but much more commonly only a fraction of the motor units in any given muscle are killed. The rest are subject to spasm, incoordination and "alienation" and, unless these factors are counteracted, spasm overcome and the continued misuse of surviving muscles and parts of muscles prevented, otherwise viable motor units may eventually die, and contractures and further crippling may be produced.

No treatment will help dead motor units, but the Kenny treatment will rescue still living units from the effects of spasm, muscle incoordination and mental "alienation." It is believed that motor units which

survive can develop a compensatory hypertrophy even to the extent of compensating for the killed units, so that there may be no apparent loss of function in a muscle that had seemed to be seriously involved. Therefore, I for one am convinced that the treatment of an acute case of poliomyelitis must include consideration of this pathologic conception of the cause of muscle dysfunction.

#### APPLICATION OF KENNY TREATMENT

We pediatricians would do well to put the Kenny techniques in their proper place in the whole detailed care of early poliomyelitis. When a new patient comes to our attention there are four general groups of manifestations to the management of which should be devoted our most earnest endeavors. These are (1) toxicity, (2) spasm and its sequelae, muscle incoordination and mental "alienation," (3) certain difficulties such as of swallowing, of breathing, of urination and of defecation, and (4) shaken morale.

On admission to a hospital many of these patients are obviously toxic, prostrated and more or less delirious. The intravenous injection of moderate amounts of a 10 per cent solution of dextrose is often useful. Sister Kenny has told me that she does not like these injections because they are in the way of the essential hot fomentations, but she grants they are sometimes very helpful. Patients should be subjected to a minimum of handling. They are irritable and in pain with many tender muscles, so complete rest is essential, or spasm will be increased. Examinations of the patient should, as far as possible, be limited to inspection. Spasm is sought after and, wherever found, is at once treated with hot fomentations according to the technique of Sister Kenny. Schwartz and Bouman have proved by their electrical recordings that under the Kenny treatment spasticity disappears and the strength of voluntary contraction improves, while without treatment spasticity does not disappear in the same time interval. Of course, nothing is permitted which may increase spasm, such as massage, electrical stimulation or splinting of any sort.

Manifestations that, in the past, have caused special trouble such as difficulties of swallowing, of breathing, of urinating and the like, are almost always largely attributable to spasm somewhere. For instance inability to breathe is found to be due principally to spasm of the intercostals and pectorals, or of the diaphragm, and is treated with hot fomentations applied more frequently and over longer periods than usual. Mechanical respirators not only interfere with this treatment but tend to aggravate the spasm, although they may oxygenate the patient and give temporary relief from suffocation. Patients with moderate respiratory difficulty because of spinal involvement, those for whom the respiratory organs have hitherto been thought to be life saving, do much better on the Kenny treatment, and patients with severe spinal involvement with so much actual paralysis of the muscles of respiration that they cannot breathe by the Kenny treatment (which naturally does not use all) would not have been saved by a respirator, although life might have been temporarily prolonged. Patients with bulbar involvement never have done well in respirators, so it is my sincere belief that those who have been most closely associated with Sister Kenny that the use of the respirator is contraindicated in the routine treatment of poliomyelitis. It is conceivable that a respirator

be valuable for keeping a patient alive until he can get the Kenny treatment for instance during transportation to a hospital

Disturbances of swallowing are usually due to spasm of the muscles of the neck and if treated early by the applications of hot fomentations around the neck are rapidly relieved. Similarly difficulties in emptying the bowel or bladder are often quickly relieved by combating the spasm of the abdominal and lower back muscles.

For the first day or two particularly in early cases, the application of hot fomentations or compresses comprises practically the entire treatment, then when the spasm is somewhat relieved, passive motion of each involved muscle is started to establish or maintain mental awareness of its function. Fatigue and increase of spasm are sedulously to be avoided. Only when spasm and tenderness are not augmented thereby is active motion permitted and the Kenny technic of muscle reeducation fully established.

A most important part of the treatment of an early acute case of poliomyelitis is management of the morale. There are few illnesses which so greatly shake the courage of a patient's parents, and sometimes of the patient himself, as does poliomyelitis. With patients on the Kenny treatment, the maintenance of morale is easier than in former years because the patients are more comfortable and are more hopeful from the start, but there are bound to be those destined to be left with limitations, despite the best care and for them and their families I plead for special consideration—consideration not to take the form of extra solicitude and sympathy but rather to emphasize the distinction between restricted and handicapped. We are all of us restricted by one factor or another, whether it be by age, vision, hearing or force of other circumstance, and some have restrictions that are more obvious than others. But only those are handicapped who admit it. Surely, to be handicapped is a state of mind, a lack of courage or will or maybe of imagination. Certainly one can recite many instances of people who have been greatly restricted but who have not been handicapped, who despite obvious limitations have fought on and conquered and who, instead of slipping into the depths, have risen to great heights. We all know of people who illustrate this point. There is the college girl who was elected president of the athletic association because she was the college champion both at archery and at canoe paddling. She had two legs that were nearly useless. A college man was awarded the most important undergraduate prize in his university because of his campus leadership. He broke the world's record in the rope climb and after graduating went on most successfully to medical school and a choice internship. He was restricted by two legs almost completely paralyzed by poliomyelitis, but he was not handicapped. A girl I know well had poliomyelitis at 14 and was left with a useless right arm and an awkward, but useful left hand. She has gone on to graduate from high school and college with honors in campus activities as well as in her studies, has completed postgraduate instruction and holds a desirable position as a librarian. She is entirely self sufficient and well adjusted. In fact the majority of patients with poliomyelitis usually achieve a workable philosophy, it is the parents who often need most help. Many of the paralytic, however find most helpful the distinction between restricted and handicapped—they become willing to recognize the fact of the restrictions but press on to achieve the most with what they have.

So a great responsibility and a great privilege now belong to the pediatricians. As children stricken by this dread disease are entrusted to us, we must institute proper measures, the insuring of rest and quiet, the combating of toxicity, of spasm, and of muscle incoordination and mental "alienation" and, finally, the maintenance of morale. For thus only do we give our patients their fullest opportunity for a maximum recovery.

25 Claremont Avenue

## SOFT PARTS DYSTOCIA

J. P. GREENHILL, M.D.  
CHICAGO

By soft parts dystocia is meant abnormal or pathologic labor due to the soft parts of the pelvis in contradistinction to difficulties encountered because of the bony pelvis. The soft parts include the vulva, perineum, vagina, cervix, uterus, adnexa, rectum and bladder. Anomalies of any one of these structures may result in dystocia. The soft parts are much more frequently the cause of troublesome labor than the bony pelvis.

It is manifestly impossible to discuss all the disturbances of the soft parts which can give rise to abnormal labor, hence I shall limit my remarks to the important ones.

### THE VULVA

The vulva is rarely the cause of dystocia and, when it is, the pathologic condition is generally high grade edema. The latter is usually due either to toxemia or to prolonged labor with considerable vaginal manipulation, but it may be due to lymphogranuloma. Rarely the vulva may be seriously enough constricted so as to interfere with labor. Such strictures may be due to improperly performed plastic operations, burns, injuries or infections, such as syphilis or granuloma inguinale. In some instances the vulvar obstructions may be easily overcome, as for example by aspiration of fluid from highly edematous labia, but in other cases the only safe procedure for the mother is abdominal delivery.

### THE PERINEUM

The perineum in primiparas is practically always a barrier to the exit of a full term baby. However, this obstruction is usually overcome by the uterine contractions with or without lacerations of the perineum, or the physician removes the barrier by manually stretching the perineum or by cutting it. Hence the perineum rarely gives any concern. Even in elderly primiparas there is seldom cause to worry about perineal obstruction. No matter how rigid the perineum may be, a sufficiently large episiotomy can practically always overcome the difficulty. The exception to this rule is the rare case of congenital or acquired narrowing which involves not only the perineum but also a good part, or all, of the vagina.

Hesitancy to employ an episiotomy has resulted in the death of some babies in cases in which there was delay at the perineum. Hence, when the second stage is prolonged, particularly when the caput is visible and still no progress is apparent, not only must the fetal heart tones be frequently auscultated to determine how the baby is tolerating labor but also an effort should be made to determine the cause of the delay. This may be

a rigid perineum, as well as failure of rotation of the head, a narrow pelvic outlet, a short cord, a constriction ring or other cause. If the perineum seems to be delaying progress, there should be no hesitancy in performing an episiotomy. Certainly if the baby's heart tones become irregular or too rapid or too slow or if the mother is exhausted, the perineum should be incised to permit delivery of the baby. If spontaneous delivery does not follow the episiotomy, forceps should be applied.

#### THE VAGINA

Among the causes of vaginal dystocia are congenital narrowing and septums, constrictions due to disease, such as diphtheria in childhood, scars from trauma of labor or unskilful operations, constrictions due to burns or infections and neoplasms in or encroaching on the vagina. In most of these cases the physiologic changes which occur during pregnancy overcome the obstructions. Thus under the influence of the excessive output of estrogen during gestation the vaginal tissues soften and dilate and constrictions may disappear. Likewise during labor obstructions may vanish, particularly septums which are pushed aside and scars which are flattened out of the way of the descending baby. Only in some instances is it necessary to perform a cesarean section for vaginal dystocia or even to incise scars and septums in order to permit delivery from below. Occasionally a colpeurynter will aid in overcoming constrictions in the vagina. In other cases a deep episiotomy extending high in the vagina will help. If, however, a tumor blocks the vagina, the safest procedure is to perform a cesarean section.

#### THE CERVIX

The term "cervical dystocia" in my opinion is used too frequently, not because I believe the cervix is rarely responsible for trouble in labor but because the cervix is blamed in far too many cases in which the physician attempts to deliver the infant through an incompletely dilated cervix. In such a case it is not the cervix which is at fault but the impatient physician. Nevertheless there are many cases of dystocia which are attributable to the cervix.

Nearly always cervical obstructions are anatomic, but in rare cases there may be a true spasm of the external os which prevents the expulsion of the baby. A spasm may be overcome by deep anesthesia alone or by this plus digital dilatation of the cervix. Anatomic strictures of the cervix may be due to scars from previous difficult deliveries, extensive electric treatment, trachelorrhaphy and neoplasms. Likewise trouble may arise because of edema of the cervix. In addition to these definite causes there are a few disturbances of the cervix which are not well understood. Among these anomalies are adherence of the membrane to the region of the internal os preventing proper dilatation, slow and incomplete dilatation due to excessive fibrous tissue in some old primiparas and conglutination of the external os, a condition in which the cervix is completely effaced but there is absolutely no dilatation, there is practically no external os and the cervix fits the presenting part snugly.

Cervical dystocia always occurs in the first stage of labor, by definition the second stage does not begin until the cervix is completely dilated and effaced. When the second stage is reached, the cervix cannot give trouble unless edema is present. In all cases of true cervical dystocia, progress ceases at a certain point, after which the pains become increasingly stronger and

more painful. In most cases the obstruction is removed by the forces of labor, but in some the physician must interfere to prevent serious damage to the mother or child, or both. If aid is not given as labor continues the child may die, the cervix may be lacerated or torn off and expelled with the child or the lower uterine segment may rupture, with escape of the baby into the abdominal cavity.

The treatment of cervical dystocia depends on the cause. Patience coupled with ample sedation will be rewarded by spontaneous delivery in most cases. In every woman whose cervix dilates slowly in spite of strong regular contractions must be closely watched. If during a long period of time labor fails to progress because of incomplete dilatation of the cervix, several methods are available to the physician.

1 Packing the vagina with cotton saturated with boroglycerin for a few hours often leads to dilatation of the cervix, so may a prolonged hot douche.

2 Digital dilation is helpful in some cases, but if the cervix is rigid and only partially effaced, this is not easy to carry out. In most cases in which finger dilation is successful the cervix is lacerated, although generally the tears are small. Attempts to dilate the cervix manually should seldom be made before the cervix is completely effaced and dilated at least 7 cm. The fingers are most useful for overcoming obstruction due to edema of the anterior lip. In such cases the edematous lip can easily be pushed upward beyond the presenting part during a labor pain. Nearly always delivery follows rapidly in such cases. In a case of agglutination of the external os, if the finger is forced into the tiny opening which is usually present in the cervix it will miraculously remove this cause of dystocia. In such a case the agglutination is not complete and pressure by a finger tip causes the tiny opening to widen rapidly, so that labor is terminated quickly. The small opening can much more readily be seen through a speculum than palpated with the gloved finger. The fingers may also be used to break up adhesions between the membranes and the cervix, after which labor will progress normally.

3 Instrumental dilation with Hegar or Bossi dilator has been recommended, but these instruments should never be used during labor because they are capable of doing great harm.

4 The metreurynter may be used to overcome cervical dystocia, but there are many disadvantages to the use of rubber bags. They are foreign bodies and their presence in the lower uterine segment and vagina increases the risk of infection, they displace the presenting part with the risk of prolapse of the cord, they increase intrauterine pressure, which is hazardous in cases of distention of the lower uterine segment. They do not physiologically dilate the cervix but often produce lacerations, and nearly always when the bag is expelled, no matter how large, the cervix retracts so that its size is considerably less than the diameter of the metreurynter that slipped through it.

5 Incisions in the cervix, generally spoken of as Dührssen's incisions, are distinctly helpful in cases of cervical dystocia, but they should never be used until the cervix is completely or almost completely effaced. If an insufficiently effaced cervix is incised there is danger of extension into the bladder, rectum or uterine arteries. Generally two or three incisions are made at 10, 2 and 6 on the clock, and they should be long enough to permit delivery of the presenting part without force. Usually it is hazardous to perform such

extraction after Dührssen's incisions because of the risk of extension of the incisions with resultant hemorrhage and possible rupture of the uterus. Therefore after the cervix has been incised it is best to await spontaneous delivery or deliver with forceps.

6 Vaginal hysterotomy or vaginal cesarean section should be done only by an experienced operator and only when the baby is small, particularly if the patient is a primipara.

7 Abdominal cesarean section is rarely necessary for cervical dystocia. However if a true anatomic obstruction exists this is the only safe procedure. If during abdominal delivery the opening in the cervix is found to be tiny, it may be advisable to amputate the uterus after the baby has been delivered. However the necessity for a Porro operation will rarely arise, because much anatomic obstruction of the cervix is most unusual and when it occurs it can be overcome by forcible dilation from the uterine cavity at the time of cesarean section.

In all cases of so-called cervical dystocia one must be certain the patient is actively in labor. In many cases severe uterine contractions occur during the last few days of pregnancy, yet the cervix does not dilate, the pains subside and the patient goes on for days in peace before true labor sets in. My own feeling is that regardless of how strong the uterine contractions may be, if the cervix does not become effaced the patient is not really in labor. Such patients are having false labor pains. In most cases sedatives, such as morphine, will stop the pains. Another point of differentiation is that solution of posterior pituitary will not increase the frequency and severity of false pains. If a physician considers such a patient as having true labor pains, particularly if the contractions continue for twenty-four or forty-eight hours, and if on his own volition or because of the insistence of the patient's family that he do something he resorts to measures to hasten labor, he invites trouble. To avoid such pitfalls, the physician should use effacement of the cervix as the criterion of the presence of true labor. If the cervix is becoming effaced the patient is in labor, and if there is no effacement after a reasonable number of hours she is not in active labor.

#### THE CORPUS UTERI

*Atony*—The body of the uterus may be the cause of dystocia in the first, second and third stages. In the first stage the most common disturbance is what is generally called atony of the uterus, although true atony does not exist. This disturbance may also occur in the second and third stages.

In the first stage atony usually manifests itself by weak and infrequent uterine contractions. Labor may drag on for days. Strong pains may occur for varying periods of time and then cease almost entirely. Dilatation and effacement of the cervix are very slow. As long as the membranes are intact there is little danger, but after rupture of the bag of waters a prolonged delay in delivery is attended with danger to the mother and baby. The chief element of risk is intrauterine infection.

Many causes have been assigned to uterine atony, including poor general health, anemia, disturbances in the nervous mechanism, few local alterations in the uterus such as fibroids and scars, overdistention due to the presence of twins or polyhydramnios and malpresentation. However in most cases the real cause of weak uterine pains cannot be found, although most likely the nervous system is at fault. In addition to the foregoing possible causes, one must always bear in mind that in

many cases atony results from fatigue that is, labor comes almost to a standstill after a prolonged period of severe uterine contractions.

The treatment of uterine atony should depend on the cause but since in most cases this is unknown one must use certain measures which have proved to be helpful empirically. There are two main ways of treating atony, and it is highly important to choose the proper one.

In the majority of cases of uterine atony the pains at the beginning of labor are strong, and then they decrease in frequency and strength. The patient is usually tired and frightened. In these cases the best remedy is to give the patient a few hours of deep sleep. This may be secured by morphine, dilaudid, paraldehyde or any of the barbiturate drugs or by a combination of drugs, but enough should be given to insure sleep and not simply amnesia or analgesia. Nearly always, soon after the patient awakens uterine contractions begin in a normal way and they continue to increase until delivery takes place. One must not forget to watch every patient who has atony for dehydration, starvation, a full bladder and a full rectum. Hence such a patient should be given fluids and nourishment (dextrose) in addition to sedatives for procuring sleep. Likewise her bladder and rectum should be emptied at regular intervals. Above all, she should never be given solution of posterior pituitary or any other oxytocic to increase the strength and frequency of the pains, because she is tired physically and mentally and requires rest, not a whipping up of uterine activity. The use of oxytocics for atony may result in fetal death, rupture of the uterus and even maternal death.

In rare cases of atony in which true pains are being experienced with effacement and dilatation of the cervix the contractions may be weak from the start and may drag on for many hours and even days. In such cases if simple measures, such as hot enemas, castor oil and quinine, do not help, solution of posterior pituitary may be used. However, only 1 minim (0.06 cc.) of the drug should be given at a time, and this should be measured in a tuberculin or similar syringe. The interval between injections should be at least twenty minutes, preferably thirty, and if pains have been initiated no more solution of posterior pituitary should be given until the pains cease. The fetal heart tones must be listened to every few minutes and certainly for at least a full minute after each injection. Furthermore, a can of ether or a bottle of chloroform should be at hand in case a too powerful uterine contraction follows an injection. I know of two ruptures of the uterus following the injection of minim doses of solution of posterior pituitary.

Atony of the uterus in the second stage of labor is usually easy to overcome. By definition the cervix is completely effaced and dilated in this stage. If the head is low down, and certainly if it is on the perineum, the baby should be delivered by means of a low forceps operation. A simpler procedure is to make an episiotomy and use the Kristeller expression to deliver the baby, but this procedure must be carried out with the utmost care to avoid traumatizing the uterus and placenta and to prevent injury to the baby. Of course, the Kristeller expression should never be attempted if the lower uterine segment is thinned out. Occasionally when the head is on the perineum it can be delivered by a modified Ritgen maneuver, that is, pressing the head out by means of the fingers placed on either side of the anus. This procedure is especially successful if combined with an episiotomy. If the head is high up

after the cervix is fully dilated, delivery should be accomplished by version and extraction.

I prefer these methods of delivery to the use of solution of posterior pituitary, which is especially dangerous in the second stage of labor. The only indication for this drug in the second stage of labor is when the head is on the perineum and there is no disproportion. Even in such a case I should resort to a low forceps operation because I can always control the instrument but not always the drug.

Uterine atony in the third stage usually results in hemorrhage. The treatment of this consists in uterine massage, removal of the placenta and membranes if they are still in utero, the intravenous injection of ergonovine, the intramuscular injection of solution of posterior pituitary, intrauterine packing and, when necessary, blood transfusions or the use of plasma or serum. I have found the injection of solution of posterior pituitary directly into the uterine muscle through the abdominal wall to be a highly effective method of controlling bleeding, but this procedure should be carried out only by an experienced physician.

*Uterine Tetanus and Spasm*—Dystocia may be produced not only by uterine atony but also by the reverse, namely, excessively severe uterine contractions. When the entire uterus is involved in the process the condition is spoken of as uterine tetanus. When only a localized area of the uterus is contracted, the condition is described as uterine stricture. The most likely cause of these disturbances is a disturbance in the nervous mechanism of the uterus. Spasms of the uterine musculature may be brought about by local manipulation, such as rough examinations, forcible dilation of an incompletely dilated cervix, intrauterine manipulation, attempt to deliver a baby through an incompletely dilated cervix and obstructed labor. Solution of posterior pituitary may also cause these anomalies.

When there is a tetanic contraction of the uterus, be it general or local, labor ceases. Both the mother and the baby, however, suffer considerably. The maternal and fetal mortality and morbidity are very high, particularly in the cases of conditions to be described as constriction rings.

Clinically the most important type of stricture of the uterus and the one which gives the most trouble is that known as Bandl's ring. The terminology of this condition is most confusing, hence a word of explanation. Situated between the body of the uterus and the lower uterine segment is a distinct area all around known by various names, such as the constriction ring of Schroeder and the retraction ring of Barbour and Lusk. However, Rudolph and Ivy properly suggested the name physiologic retraction ring for this area. This ring is usually at the level of the symphysis pubis and is at about the region where the anterior uterine peritoneum is fixed to the uterus. In contradistinction to the physiologic retraction ring is the Bandl ring, which is called the pathologic retraction ring by Rudolph and Ivy. This is usually situated about 14 to 16 cm. above the superior border of the symphysis pubis or in the region of the umbilicus. It may be identified as an oblique or transverse depression in the anterior abdominal wall. It is distinctly palpable when a hand is inserted into the uterine cavity, and this is the only way to make an absolute diagnosis of pathologic retraction ring. Whenever such a ring is present one must be on guard against a rupture of the uterus, because the lower uterine segment is usually elongated and thin, on the other hand, the corpus is thicker.

In a woman with a pathologic retraction ring the uterine contractions are very painful, but in spite of this there is no progress in labor. The delay in labor is usually erroneously ascribed to cervical dystocia, occiput posterior or disproportion.

Abdominal examination in a case of Bandl's ring usually reveals the groove as described. On rectal examination it will be found that in spite of strong and regular pains the cervix is not fully dilated, that it is soft and edematous and that the head does not seem to fit the pelvic cavity. On vaginal examination the soft, succulent, incompletely dilated cervix can be felt and also the head, which does not come down to fill the lower uterine segment during a uterine contraction. Insertion of the hand into the uterine cavity easily reveals the tense ring all around the uterus. Bandl's ring may, of course, develop in the second stage of labor, and in such a case either the head comes down almost to the perineum during each contraction and immediately recedes or it does not come down very far with the pains. A localized spasm may occur in the third stage of labor and interfere with placental separation.

The preparation of the patient's psyche for labor may prevent the development of Bandl's ring in some cases, especially in women who are unduly apprehensive about childbirth. Likewise, the avoidance of oxytocics, rough vaginal examinations, unnecessary intrauterine manipulations and forcible dilation of the cervix will definitely diminish the incidence of pathologic retraction ring. The proper use of sedation will prevent the condition in a few more cases.

If the diagnosis is made during the first stage, large doses of sedatives should be given in order to secure rest for the uterus and sleep for the patient. If this plus repeated bolstering of the patient's psyche by encouragement and fortification of the patient's physical condition by means of fluids and dextrose do not result in progress after a long lapse of time, delivery must be accomplished. Sometimes, when the patient is in excellent physical condition, when the vaginal examination was performed gently and without risk of infection and when the baby is in good condition, cesarean section should be performed, preferably the cervicohysterotomy type and under local anesthesia. In other cases, if the head is fairly low down and the cervix completely dilated, the Bandl's ring may be gently but steadily dilated under deep anesthesia and the baby delivered by forceps. Ether and chloroform are the best anesthetics for this purpose. If difficulty is encountered under deep anesthesia, 8 minims (0.5 cc.) of epinephrine should be given hypodermically, as advocated by Rucker. This treatment often results in relaxation of the ring. If the head is high and the ring cannot be dilated, version and extraction may be performed if the lower uterine segment is not thinned out. In some cases it will be necessary to dilate the cervix manually before delivery by forceps or version can be accomplished. If the baby is dead, and in some cases in which it is alive, the application of a Wrigley's or a volsellum to its scalp with an attached wire will result in spontaneous delivery. In some cases, if the baby is dead, craniotomy must be done. Whenever manipulations from below fail to bring about delivery of the baby a Porro operation must be done. In the average skill are used. In some cases an external cesarean section, such as the one described by Wrigley, will enable the operator to save the uterus.

*Other Causes of Uterine Dystocia*—Another disturbance of the uterus which may result in dystocia is the presence of myofibromas. Fortunately in most cases these growths give very little trouble during labor. Sometimes they cause irregular contractions in the first stage, occasionally they produce malpresentations, and not infrequently they result in hemorrhage in the third stage and infection in the puerperium. Rarely they block the exit of the child making cesarean section imperative.

Still another uterine source of dystocia is the presence of a scar from a previous cesarean section. Regardless of the type of cesarean section performed there is always some risk of rupture in a subsequent pregnancy and labor. After the classic operation many ruptures have occurred not only during labor but also in pregnancy while the patient was at rest. However, after the cervical cesarean section rupture during pregnancy is extremely rare and rupture during labor is far less common than after the classic operation. Regardless of this every woman who has had a cesarean section should give birth to all her subsequent babies in a hospital. If the same indication for cesarean section exists as for the first operation for example a contracted pelvis of course the operation should be repeated, preferably a few days before term or as soon after the onset of labor as possible. However, if the indication for the first cesarean section is placenta previa or severe toxemia, is not present subsequently, the patient may be permitted to deliver from below, but only in a hospital. If vaginal delivery is to take place it is safest to deliver the baby by low forceps soon after the cervix is completely dilated. If there is good reason to believe that the cesarean scar did not heal properly, as may occur after a markedly febrile puerperium, or if a defect is definitely felt through the abdomen, an elective cesarean section should be performed a week or ten days before term.

Scars from myomectomy operations need not be feared, because a rupture of such a scar in labor is a great rarity.

#### THE ADNEXA

Practically the only way the adnexa can result in dystocia is by the development of a tumor. The most frequent neoplasm of obstetric interest is an ovarian cyst, regardless of whether it is a simple serous cyst, a dermoid, carcinoma or other type. The only consideration is whether the growth is large and obstructs the exit of the child. Otherwise it has practically no obstetric importance unless it undergoes torsion. If acute torsion occurs an operation must be performed, whether this takes place in pregnancy, labor or the puerperium. Ovarian cysts give rise to dystocia much more frequently than do uterine fibroids, hence some obstetricians believe that every ovarian neoplasm discovered during pregnancy should be removed. However, I have followed many women with ovarian cysts during pregnancy, labor and the puerperium without observing any harm. Hence I believe that if an ovarian tumor is drawn up out of the pelvic cavity during pregnancy and does not block delivery of the baby it should be left alone. If, however, an ovarian cyst remains in the cul-de-sac and cannot be displaced by posture and gentle pressure, it should be removed, preferably during pregnancy. If there is reason to suspect malignancy of an ovarian tumor or if a roentgenogram reveals a dermoid cyst, an operation should likewise be performed.

#### FULL BLADDER AND RECTUM

Occasionally an overdistended bladder or an overloaded rectum will interfere with the progress of labor. For this reason it is important to be sure the patient empties her bladder and rectum or that these organs are emptied by catheter and enema respectively whenever these procedures seem necessary.

### PITRESSIN TANNATE IN OIL IN THE TREATMENT OF DIABETES INSIPIDUS

HARRY BLOTNER, M.D.

BOSTON

The effects and disadvantages of solution of posterior pituitary and of pitressin administered hypodermically or intranasally in relieving the symptoms of diabetes insipidus are well known. The subcutaneous injection of the drug causes local irritation and is frequently followed by intestinal cramps, diarrhea, headaches, palpitation and pallor. Moreover, the therapeutic effect is temporary, lasting only a few hours. In order to control a patient's symptoms by this method, it is necessary to inject the drug three, four or more times a day. The intranasal use of solution of posterior pituitary and of pitressin appears to be somewhat more satisfactory because it avoids the necessity of injection and can be taken easily a number of times a day. Again, however, the effect lasts only for several hours. Frequently patients become sensitive to the drug intranasally with resultant sneezing, irritation of the nose and a mucous discharge and diminished absorption.

A compound solution of posterior pituitary with slow absorption and a greatly prolonged antidiuretic effect appears desirable, especially if there are no side reactions. Green and January<sup>1</sup> found that pitressin tannate in oil given subcutaneously to 3 patients with diabetes insipidus had an antidiuretic effect for thirty to eighty-two hours. In Stephens's<sup>2</sup> cases, single injections of this preparation exhibited an antidiuretic effect for twenty-four to ninety-six hours. Thorn and Stein<sup>3</sup> observed that the intramuscular injection of pitressin tannate in oil was very effective in 3 cases of diabetes insipidus and that the symptoms were controlled for twenty-four to forty-eight hours. It appears that pitressin tannate in oil, administered hypodermically, has an antidiuretic effect in cases of diabetes insipidus which may last for twenty-four to ninety-six hours.

This paper reports the results in 8 cases of diabetes insipidus following the subcutaneous or intramuscular injection of pitressin tannate in oil.<sup>4</sup>

The plan of study consisted chiefly in observing the daily fluid intake and output before and after the hypodermic injection of pitressin tannate in oil. In addition,

4 Pitressin tannate is a water in oil chemical combination of the pressor fraction of the posterior lobe of the pituitary gland with tannic acid. The pressor fraction is precipitated with tannic acid and the precipitate is removed by filtration, washed and dried under aseptic conditions. Five pressor units of pitressin tannate is suspended in 1 cc of peanut oil. The pitressin tannate in oil was supplied by Parke Davis & Co.

the weight of the patients and the specific gravity of the urine were noted frequently. Various blood tests were made in certain instances. In all of the cases 1 cc of pitressin tannate in oil was injected subcutaneously or intramuscularly daily for several days and then on

Chart 1—Relative effects of pitressin, pitressin tannate in oil and no treatment on the daily fluid intake and output of a patient (Mr. H. N.) with diabetes insipidus

alternate days or at longer intervals. The longest period of administration of the drug in these cases was seven months.

#### CLINICAL MATERIAL AND RESULTS

The persons studied included 5 males and 2 females who had had diabetes insipidus of idiopathic origin for a number of years and 1 male whose diabetes insipidus was due to a brain tumor. Except for the last person, I have observed the cases for three or ten years and know well the state of their disease. The ages of the males ranged from 14 to 37 years and the ages of the women were 29 and 72 years. All were relieved of the polyuria and polydipsia with the intramuscular or intranasal administration of solution of posterior pituitary except the patient with brain tumor.

#### REPORT OF CASES

The cases are presented briefly as follows.

**CASE 1—H. N.**, a man aged 37, unmarried, had had diabetes insipidus for seventeen years. His general physical examination was normal, although he was about 10 pounds (4.5 Kg) underweight. His daily fluid intake and output usually varied from 10 to 11 liters. With 1 cc of pitressin injected four times a day, his daily fluid intake and output were about 2 to 4 liters. When 1 cc of pitressin tannate in oil was injected daily, the fluid intake dropped to approximately 2 liters and the urine volume to about 1 liter a day. When the drug was omitted for four or five days the fluid intake and output had increased but not to the large volumes which were present before this therapy

was started. After four days of treatment with the drug he put on 3 pounds (1.3 Kg). The details of his fluid intake and output are recorded in chart 1. Later the drug was administered every other day and the fluid intake and output remained at about the level when the drug was given each day.

**CASE 2—Miss E. S.**, a school teacher aged 29, had had polyuria and polydipsia for eleven years. Her daily fluid intake and output had been about 10 or 11 liters. The menstrual history had been normal, but the intramuscular injection of solution of posterior pituitary caused dysmenorrhea. One cc of solution of posterior pituitary injected three times a day or the intranasal insufflation of powdered pituitary about five or ten times a day reduced the daily fluid intake and output to about 3 liters. The physical examination was negative. She was about 15 pounds (6.8 Kg) underweight. The administration of 1 cc of pitressin tannate in oil, daily and on alternate days, reduced her daily intake and output to a low level, usually between 500 and 1,000 cc. The details of her fluid intake and output are shown in chart 2. Here again the fluid intake and output increased considerably after the drug had been omitted for six days but not to the high level present before therapy. No painful menses occurred during this treatment.

**CASE 3—F. C.**, a man aged 36, married, a clerk, developed diabetes insipidus during the course of a severe septic throat twelve years previously. His daily fluid intake and output during the past four or five years had been about 10 liters. He was unable to use solution of posterior pituitary intranasally because it produced asthmatic attacks. The physical examination was normal. The administration of 1 cc of pitressin tannate in oil every sixty hours kept his daily fluid intake and output at approximately 1 liter.

**CASE 4—J. K.**, a man aged 30, a clerk, had had polyuria and polydipsia for eleven years. His daily fluid intake and output had been as high as 11 liters in the past and about 6 liters during the last three or four years. The physical examination showed him to be about 15 pounds (6.8 Kg) underweight. The skin was of the female type and he was sexually underdeveloped. The administration of 1 cc of pitressin tannate in oil every other day reduced his fluid intake and output to approximately 0.5 to 1 liter a day.

**CASE 5—A. S.**, a man aged 27, unmarried, a musician, had the disease for sixteen years with a daily fluid intake and output of about 14 liters. This was reduced to 3 or 4 liters when 1 cc of solution of posterior pituitary was injected

Chart 2—Relative effects of solution of posterior pituitary, pitressin tannate in oil and no treatment on the fluid intake and output of a patient (Miss E. S.) with diabetes insipidus

times a day. The physical examination was entirely normal. The administration of 1 cc of pitressin tannate in oil on alternate days reduced the daily fluid intake and output to about 2 liters a day.

**CASE 6—Mrs. M. A.**, aged 72, a housewife, had had diabetes insipidus for eleven years. She had had the menopause about

previously. Her daily intake and output had been about 10 liters. She had a total thyroidectomy on June 24, 1935, and the details of this aspect of the case were published elsewhere.<sup>5</sup> The essentials of the recent examination were obesity, moderately enlarged heart and slight edema of the legs. Her height was 5 feet (152 cm) and her weight 198 pounds (90 kg). The pulse rate was 72. The basal metabolic rate was -10 per cent. Her daily intake and output had been about 10 liters until a year ago when it dropped to about 6 liters. Five-tenths cc of solution of posterior pituitary administered intranasally three or four times a day reduced the values to approximately 2 or 3 liters a day. The injection of 1 cc of pitressin tannate in oil every other day kept the fluid intake and output at approximately 1 liter.

CASE 7—G A, a boy aged 14 years had had polyuria for five and one-half years with a daily fluid intake and output of approximately 10 liters. He had been maturing sexually during the previous three months. The physical examination was normal. The fluid intake and output had been about 3 liters on 25 mg of powdered pituitary taken by insufflation four times a day. The daily administration of 1 cc of pitressin tannate in oil for several days reduced the daily fluid intake and output to slightly less than a liter beginning with the first injection. When the drug was given on alternate days, the volumes rose to approximately 3.5 liters on the day it was not used.

CASE 8—R M, a man aged 29, single, an electrician was found to have a neoplasm of the third ventricle of unknown type in October 1932 and had received roentgen therapy for this. For the past six months he had had some polyuria. However, during the previous week he developed great thirst and frequency and said that his intake was about 8 liters a day. His general physical examination was not remarkable except for some neurologic changes due to the brain tumor. His spinal fluid contained 107 mg of protein per hundred cubic centimeters. At the hospital his fluid intake ranged from 4,350 to 5,950 cc and the output from 4,200 to 5,760 cc without therapy. On 1 cc of solution of posterior pituitary injected twice a day his fluid intake ranged from 4,300 to 7,200 cc and the output from 3,300 to 6,700 cc. With the daily injection of 1 cc of pitressin tannate in oil the fluid intake ranged from 3,200 to 2,400 cc and the output from 1,100 to 1,950 cc.

#### COMMENT

The hypodermic administration of 1 cc of pitressin tannate in oil was very effective in reducing the fluid intake and output to normal in these cases. The effect of the first injection of the drug was so evident that the subsequent twenty-four hour fluid intake and urine volume were normal. When injected daily its antidiuretic effect became cumulative and these volumes decreased to below the average normal. The antidiuretic effect usually was as obvious during the second twenty-four hours as it was during the first twenty-four hours after the injection of the drug. Consequently the frequency of the use of 1 cc of this medication was adjusted so that it was given every forty-eight or sixty hours. With this adaptation the fluid intake was near normal and the polyuria, polydipsia and thirst completely disappeared. In the case of brain tumor the duration of action of the drug was only about thirty hours, but in this case standard solution of posterior pituitary had no effect. This was the only case in which the drug was needed daily.

It was interesting that the patients commented that pitressin tannate in oil increased the saliva and improved the appetite and digestion. Also the dryness in the mouth, which occurred even with solution of posterior

pituitary therapy, disappeared. There were no disagreeable side reactions such as local irritation, slough, pallor or intestinal cramps. Nevertheless 4 of the 8 patients have discontinued the use of pitressin tannate in oil because they can take pituitary intranasally and avoid injections.

There was no significant change in the body weight after administration of pitressin tannate in oil with the dose used except in 1 case in which 3 pounds (1.3 kg) was gained after four days of the daily injection of the drug. The specific gravity of the urine, which was usually 1.001 or 1.002, increased to 1.026 and even 1.030 with pitressin tannate in oil therapy.

The hematocrit and phenolsulfonphthalein excretion were determined before, during and after treatment with pitressin tannate in oil in 1 case. The phenolsulfonphthalein excretion remained the same during the various periods of observation being approximately 68 per cent in one hundred and thirty minutes. The blood showed slight dilution, as evidenced by the hematocrit of 42 per cent without treatment and 38 per cent during therapy.

#### SUMMARY

Some observations were made on the effect of hypodermic injections of 1 cc of pitressin tannate in oil on the daily fluid intake and output of 8 patients with diabetes insipidus. It usually was administered daily for several days and then on alternate days.

The duration of its action in controlling the polydipsia and polyuria was forty-eight to sixty hours in 7 cases of diabetes insipidus of idiopathic origin and thirty hours in 1 case in which the polyuria was refractory to solution of posterior pituitary and due to a brain tumor. There were no appreciable changes in the body weight or toxic reactions with the dose and frequency of the administration of the drug in these cases.

The fluid intake and output of patients with diabetes insipidus was maintained at a normal level with pitressin tannate in oil more consistently and satisfactorily than with any other drug.

---

**Bird Preserves**—There are five large national organizations of bird lovers: the American Ornithological Union with a membership of 1,800 composed chiefly of professional people (educators, scientists, lawyers), the National Audubon Society with 6,300 adult members and more than 200,000 school children in the Junior Audubon Clubs, the Wilson Ornithological Club and the Cooper Ornithological Club, each with over 1,500 members and the bird banding organizations, of which there are four with interrelationships among them.

The National Audubon Society does not limit its interest entirely to birds, and since its organization in 1885 it has been one of the most powerful forces for conservation of wild life in this country. It was largely responsible (during the term of President Theodore Roosevelt) for starting bird preserves, of which the federal government has established about one hundred and seventy, covering approximately 14,000,000 acres. The Audubon Society itself maintains protection on 5,000,000 acres in thirty-six different areas, and most of the states have set aside preserves amounting to several thousand in number. The largest preserve, set aside by Taft, is in the delta of the Yukon, an area larger than the state of Connecticut. In 1913 President Wilson established the Panama Canal as a bird refuge. There are countless private bird preserves. As a result of these efforts undoubtedly the smaller birds are more numerous in this country than ever before.—Menninger, William C. *Bird Study*. *Bull Menninger Clin* 6:93 (May) 1942.

THE ACUTE TOXICITY OF MERCURIAL DIURETICS

ARTHUR C DeGRAFF, M D  
AND  
ROBERT A LEHMAN, Ph D  
NEW YORK

Several human fatalities have recently been reported for which the intravenous injection of a mercurial diuretic was believed to be the causative agent<sup>1</sup> It therefore seemed desirable to make a comparison of toxicity of the mercurial diuretics by this route and to study the influence of the drugs commonly used in the treatment of heart disease on this toxicity The drugs used for the comparison were esidrone, mercupurin and salyrgan-theophylline and the three parent mercurials, esidrone without theophylline, mercurin and salyrgan

PROCEDURE AND RESULTS

*Comparative Acute Lethal Dose*—The cat was selected as the experimental animal The drugs were injected without dilution so that the concentration of mercury was approximately 40 mg per cubic centimeter in every case Injections were given into the femoral vein by means of a micro buret connected to a 19 gage needle with a short piece of rubber catheter

vival would be even more applicable, but such a quantal response technic would require a prohibitive number of animals to obtain the same precision as in the method just described Medium size healthy cats were assigned by lot to the drugs listed in table 1 Excepting esidrone without theophylline, and theophylline sodium acetate the assays were run in parallel, 2 cats being killed for each of the five drugs on each of three days The results are thus not biased by a secular trend in the sensitivity of the animals

The results of the assay of the diuretics are given in table 1 together with other pertinent information The lethal doses are expressed in cubic centimeters of ampule solution per kilogram and are adjusted on the basis of chemical analysis to an equal mercury concentration of 40 mg per cubic centimeter It will be seen that esidrone was the most toxic drug either with or without theophylline, salyrgan is intermediate and mercupurin, mercurin and salyrgan-theophylline are the least toxic

*Comparison of Mercupurin and Salyrgan-Theophylline*—These drugs are the only mercurial diuretics that are available to the physician at the present time It is therefore important to decide whether or not there is a significant difference between the mean lethal dose of 0.83 cc per kilogram for mercupurin and 1.11 cc per

TABLE 1—Composition and Lethal Dose of Mercurial Diuretics in the Cat

| Drug  | Mercupurin                                   | Mercurin                                     | Salyrgan Theophylline                        | Salyrgan                                     | Esidrone                                     | Esidrone Without Theophylline        | Theophylline Sodium Acetate |

No anesthesia was used and conditions thus approximated those which obtain clinically It seemed probable that the rate of injection might modify the magnitude of the lethal dose and therefore a scheme similar to the proposed U S P XII cat assay for digitals was adopted An amount (one tenth to one fifteenth of the lethal dose determined by preliminary experiments) of drug was injected per kilogram every two minutes, so that death should occur between twenty and thirty minutes after the start of the injections This time interval was made as short as possible so that the lethal action of the drug would be limited to the acute phenomena observed in man It is recognized that a single injection with the observation of death or sur-

kilogram for salyrgan-theophylline For this purpose was calculated according to Fisher and found to be 1.93, which fails to exceed the expected value of 2.22 for odds of 20 to 1 Thus, there is better than a chance in twenty that the difference between the two mean lethal doses might have occurred by random sampling alone, and by the usual criteria the difference would not be considered significant

*Influence of Theophylline*—Theophylline was initially added to these drugs because it was known to enhance their absorption and lessen their local toxicity It will now be seen that (table 1) theophylline lowers the acute intravenous toxicity in the case of salyrgan and mercurin, although it fails to alter the toxicity of the esidrone mercurial base It has previously demonstrated<sup>2</sup> that theophylline mer-

1. Friedfeld, Louis, Kissin, Milton, Modell, Walter, and Sussman, Ralph. Mercupurin, correspondence, J A M A 117: 1806 (Nov 22) 1941  
2. DeGraff, A C. Buttermann R C. Lehman P A. Proc Soc Exper Biol & Med 39: 250 (Nov) 1937

maximum rate of urinary excretion of salyrgan to a greater extent than mercurin and causes both maximums to occur somewhat earlier. From table 1 it appears that theophylline lowers the toxicity of salyrgan to a greater extent than mercurin, and it seems logical to surmise that the onset and rate of excretion of mercury

Linear relationship between reciprocal injection rate and mean lethal dose for mercupurin in the cat

following injection of these mercurials is an important factor in determining their lethal dose in the cat. Since the lethal dose of theophylline itself by this technic is about six times as large as the least toxic mercurial, it is unlikely that this substance makes any considerable contribution to the lethal effect. The action of the theophylline is most probably the result of a chemical combination with the mercurial, as was shown for its other effects.<sup>3</sup> There is, of course, no way to determine whether the lethal doses found in this study for the cat stand in the same relationship to each other as they do for man. However, deaths were reported a few months after the marketing of esidrone but were observed only after several years of clinical use of salyrgan and mercupurin. This would lend credence to the assay results, since esidrone was found to be much more toxic than mercupurin or salyrgan.

**Influence of Other Drugs on the Lethal Dose of Mercupurin**—Various drugs are used in the treatment of heart disease concomitantly with the mercurial diuretics, and it seemed possible that one of them might, by sensitization of the heart, or in some other way, precipitate the fatal syndrome. Furthermore, the rate of injection will control the concentration of mercury to which the tissues are at any time exposed. These two factors were studied simultaneously, a randomized 5 by 5 Latin square design being used. This procedure has been described in detail by Fisher<sup>4</sup> and others and has the advantage of efficiency in the use of the animals and in evaluating the interaction of the variables. In this study mercupurin was used as a typical mercurial diuretic and was injected in doses of 0.13 cc per kilogram. Five cats were killed on each of five days. On any given day 1 cat was killed by repeated injections at each of the following five time intervals: 0.5, 1.0, 1.5, 2.0 and 2.5 minutes corresponding to reciprocal injection rates of 38, 77, 115, 154

and 192 minutes per cubic centimeter. At the same time that rates of injection were varied on different days there were five preliminary treatments given, as here listed. The doses per kilogram are as nearly as possible equal to the maximum which would be used clinically.

**A Digitaline Nativelle** This was administered intravenously twenty-four hours before the assay at a dose of 0.025 mg per kilogram, or about one-sixteenth the average lethal dose.

**B Aminophylline** Fifteen minutes before the assay, 48 mg per kilogram was injected intravenously.

**C Ammonium Chloride** One hour before the experiment, 20 mg per kilogram was administered orally in a red gelatin capsule. The animals were put into individual cages and observed carefully, and whenever there was evidence of emesis the animal was taken out of the series and another substituted.

**D Untreated control**

**E Soluble Phenobarbital** One hour before the assay, 20 mg per kilogram was given orally in a capsule and the same precautions taken as in C against loss of the drug by emesis.

The lethal doses in cubic centimeters of ampule solution per kilogram are given in table 2. In table 3 the analysis of variance for these data is given in the usual form so as to test the significance of the various factors. The conclusions from this experiment are that (1) there was no significant modification of the lethal dose either because of determinations on different days or (2) as the result of treatment with other drugs commonly used in heart disease.<sup>5</sup> On the other hand, there was (3) a highly significant linear relationship between the interval between injections and the lethal dose. This relationship is shown graphically in the chart. It will be seen that the longer the interval between injections (or the longer the length of time required for injection of 1 cc), the smaller the lethal dose. However, after about forty minutes per cubic centimeter the curve flattens but will undoubtedly rise again when the intervals become so long that excretion becomes a major factor. The implication is that these mercurials have a slightly delayed action and that injecting them in man at an unusually slow rate would give no guaranty that a reaction would not occur. It may be noted from the chart that the point plotted at 0.83

TABLE 2—Influence of Preliminary Treatments and Injection Intervals on the Lethal Dose of Mercupurin in Cubic Centimeters per Kilogram

Treatments are designated A, B, C, D and E and are described in the text

| Date of Experiment | Interval Between Injection of 0.13 Cc per Kg |         |         |         |         |
|--------------------|--|---------|---------|---------|---------|
|                    | 0.5 Min                                      | 1.0 Min | 1.5 Min | 2.0 Min | 2.5 Min |
| December 3         | 1.30 C                                       | 1.43 A  | 1.30 D  | 1.17 E  | 0.63 B  |
| December 4         | 1.95 D                                       | 1.17 B  | 1.30 E  | 1.04 C  | 1.04 A  |
| December 5         | 1.82 B                                       | 1.30 C  | 1.30 A  | 1.04 D  | 0.91 E  |
| December 8         | 1.69 A                                       | 1.43 E  | 0.82 C  | 0.91 B  | 0.91 D  |
| December 9         | 0.78 E                                       | 1.30 D  | 1.04 B  | 0.91 A  | 1.04 C  |

cc per kilogram and forty minutes per cubic centimeter is taken from table 1. Thus it appears that (at least in the case of mercupurin) the lethal dose determined over a twenty to thirty minute period actually approaches a minimum average lethal dose under the conditions described.

5 It is recognized however that long continued treatment with digitaline Nativelle can cause myocardial damage in the cat and ammonium chloride depletion of base. Hence the single doses used here do not exhaust the possibility of a synergistic effect on the mercurial diuretics.

*Effect of Dilution*—Since the maximum effect of these mercurials comes on only after a delay of some minutes, dilution would not be expected to have any considerable effect. This is shown in table 4. The mercurium ampule solution was diluted with isotonic solution of sodium chloride as indicated and approximately one lethal dose (0.83 cc per kilogram) was injected over a period of twenty seconds in each case. There is some indication that the drug is less toxic when highly diluted. Nevertheless, 1 animal out of 3 died at a dilution of 25 to 1, so that this would not seem to offer any practical solution to the problem of human fatalities.

*Mechanism of the Lethal Action*—In order to determine whether or not the circulatory action of the mercurial diuretics used in this study is qualitatively the same as that of other mercurials whose actions have been reported in the literature, various experiments were carried out on the cat under pentobarbital anesthesia. Measurements were made of the mean carotid blood pressure, venous pressure, respiration, electrocardiogram and intestinal and hind limb volume after intramuscular and repeated intravenous injections of several of the diuretics used. The evidence obtained is in agreement with previous reports and indicates that death is primarily the result of the cardiac action of mercury. The organic residue unquestionably modifies the magnitude of the lethal dose but does not appear to cause any qualitative change in the fatal sequence of events.

If the mercurial is introduced into the blood stream rapidly, the heart may suddenly go into ventricular fibrillation and continue to fibrillate for several minutes after the blood pressure has fallen to zero and the

TABLE 3—Analysis of Variance for Factors Affecting the Lethal Dose of Mercurium (Data of Table 2\*)

| Variation Due to   | Degrees of Freedom | Sum of Squares | Variance  | Variance Ratio | Interpretation   |
|--|--------------------|----------------|-----------|----------------|--|
| Assumption of a linear relationship between the lethal dose and the injection interval (reciprocal rate) | 1                  | 0.137,770      | 0.137,770 | 9.24           | Odds are about 100 to 1 against this value occurring by random sampling                                    |

\* The lethal doses of table 2 were changed before the analysis to logarithms, since this function usually is more normally distributed than is the dose in cubic centimeters per kilogram.

respirations have ceased. With more gradual administration of the drug (either intravenously or by a large dose intramuscularly) the electrocardiogram shows T wave changes followed by an intraventricular block. These effects are accompanied by a gradual fall in the arterial and venous pressures and an equivalent fall in the volume of the intestine and the leg. As more drug is injected intravenously or absorbed from

the muscle, a rapid ventricular tachycardia usually ensues, the blood pressure fluctuates in a highly irregular manner between about 10 and 40 mm of mercury and the venous pressure rises sharply. This state may terminate in one of the following ways: (1) The respiration fails, presumably owing to anoxia resulting from

TABLE 4—Effect of Dilution of Mercurium on the Lethal Effect. Approximately one lethal dose (0.83 cc per kilogram) given in twenty seconds.

| Cat | Dilution | Result             |
|-----|----------|--------------------|
| 1   | 5 times  | Died in 10 minutes |
| 2   | 5 times  | Died in 8 minutes  |
| 3   | 5 times  | Survived           |
| 4   | 12 times | Died in 18 minutes |
| 5   | 25 times | Died in 20 minutes |
| 6   | 25 times | Survived           |
| 7   | 25 times | Survived           |

the low blood pressure, (2) death results from ventricular fibrillation, or (3) the heart recovers to slow sinus rhythm with an intraventricular block and the blood pressure rises. Mercuric succinate, mercuric bichloride, salyrgan and neptal have been studied. Salant and his co-workers,<sup>6</sup> Jackson, McCrea and Meek,<sup>8</sup> Cohen,<sup>9</sup> Debre, Leroux and Hazard<sup>10</sup> and Johnston,<sup>11</sup> with results similar to those just described. The influence of the autonomic nervous system on the action of the mercurials was studied by Salant and Kleitman,<sup>12</sup> who showed that neither bilateral vagotomy nor atropinization would alter the effect, and by Salant and Brodman,<sup>13</sup> who found that epinephrine improves the heart poisoned with mercury while paralysis of the sympathetic nerve endings with ergotamine increases the toxicity of the mercurial. These results have been in general confirmed. It should be mentioned that there is no evidence from animal experiments that sudden pooling of blood in the periphery is responsible for the effects of these drugs, as would be the case with an anaphylactoid reaction or the like.

The possible treatment of the cardiac irregularities following the mercurial diuretics is being considered and will be reported shortly. Johnston<sup>11</sup> showed that the isolated turtle heart recovered from mercurial poisoning by treatment with sodium thiosulfate. It has been found that this occurs also in the intact cat. The action of sodium formaldehyde sulfoxylate is being investigated in this connection.

CONCLUSIONS

1. The lethal doses for six mercurial diuretics injected intravenously in the cat so as to kill within twenty to thirty minutes are salyrgan-theophyllin 1.1, mercurium 0.83, mercurin 0.70, salyrgan 0.41, etc.

0.24 and esidrone without theophylline 0.27 These values are in cubic centimeters per kilogram and have been adjusted to a mercury content of 40 mg per cubic centimeter

2 Previous treatment with oral ammonium chloride, oral phenobarbital, intravenous aminophylline and intravenous digitiline Natrelle had no effect on the lethal dose of mercupurin

3 At least in the case of mercupurin, the lethal dose is smaller the slower the rate of injection (or the greater the interval between injections) This suggests (a) that the sudden death following these drugs cannot be avoided by slow injection and (b) that lethal doses of the various drugs should be compared only when the animals die within the same average time interval

4 Dilution of the drug is of little value in preventing death from the intravenous injection of mercupurin

5 Death is caused by action of these drugs on the heart An early manifestation is a change in intraventricular conduction while the terminal effect is either ventricular fibrillation or respiratory failure secondary to the cardiac action

## SUDDEN DEATH AND MERCURIAL DIURETICS

M HERBERT BARKER, MD  
HOWARD A LINDBERG, MD  
AND  
MORRIS E THOMAS, MD  
CHICAGO

Our purpose in this communication is to report the death of 4 patients following the injection of different mercurial diuretics and to point out the similarity of the cardiac function of these patients at the time of death to the experimental cardiac arrest in dogs produced by mercury

Jackson<sup>1</sup> reported on the pharmacologic action of organic mercury compounds on the heart By using 5 cc of a 2 per cent solution of salyrgan intravenously, he was able regularly to produce death by ventricular fibrillation within three to five minutes in normal dogs under ether anesthesia If the vagus inhibition of the heart was removed either by direct section or by large doses of atropine, death occurred from respiratory failure before the onset of ventricular fibrillation He was of the opinion that the mercurials acted primarily on the heart through the mechanism of stimulation of the vagus and secondarily on the respiratory center if the vagal effect was removed Salant and Kleitman<sup>2</sup> had previously observed ventricular fibrillation in normal dogs following the intravenous administration of inorganic mercurial salts and mercurochrome Chastain and Mackie<sup>3</sup> studied the effects of esidrone (an organic mercurial with theophylline) on normal dogs

<sup>3</sup> Chastain L L and Mackie G C South Med & Surg 102 5 (Jan) 1940

anesthetized with barbiturates They were regularly able to produce death by giving large intravenous doses of mercury salts From twelve to fifteen seconds after the administration the electrocardiogram showed deviations of the T waves followed by ventricular flutter and fibrillation Death occurred in from three to five minutes

Five deaths following the use of mercurial diuretics have been reported<sup>4</sup> Each of the patients was suffering from the nephrotic type of renal disease and 4 of the 5 were children Since each patient had received previous injections, "anaphylaxis" was considered the cause of death

To the reported cases we wish to add the reports of the deaths of 4 adults with the following clinical and anatomic diagnoses (1) coronary sclerosis, tabes dorsalis and minimal evidence of syphilitic heart disease, (2) nephrotic state of chronic glomerulonephritis, (3) hypertensive cardiovascular disease with decompensation, and (4) hypertensive cardiovascular disease with cirrhosis In reporting these cases, only the significant clinical, laboratory and postmortem observations will be given

CASE 1—H T, a white man aged 59, was seen Nov 25 1930 because of weakness and moderate dependent edema associated with arteriosclerotic heart disease and tabes dorsalis The electrocardiogram showed a rate of 90, sinus mechanism, slurring of the QRS in all three leads and absent ST intervals The blood pressure was 120 systolic and 80 diastolic His general condition was greatly improved on a low sodium-high potassium diet together with 2 Gm of ammonium nitrate after meals There were occasional recurrences of edema and breathlessness which became more difficult to control, so that short periods of bed rest were required Between 1932 and 1935 twelve intravenous injections of salyrgan were given, with excellent diuretic response Even though the patient felt well most of this time, wasting of the body, characteristic of chronic cardiovascular disease, was indicated by a gradual loss of weight from 163½ pounds (74 Kg) in 1930 to 116 pounds (52.6 Kg) in 1935

On Jan 15, 1935 2 cc of mercupurin was given slowly intravenously and from three to five minutes later the patient sat up in bed, his eyes turned upward and he fell back unconscious Twitching of the body, deep cyanosis and asystole were followed by an occasional ventricular contraction then short runs of what were interpreted as atricular fibrillation The patient regained consciousness and a normal mechanism was resumed It was estimated that the whole episode lasted about ten minutes, and the patient felt perfectly well in half an hour His usual activity was resumed during the next few weeks Edema gradually accumulated and on April 12 it was decided to administer a mercurial diuretic Because of the previous episode, this time 2 cc of salyrgan (plain) was administered slowly intravenously Two minutes later a few extrasystoles were noted, there were rapid runs of fibrillation, the patient became very restless and then what seemed to be a ventricular tachycardia followed The patient rose in bed, became deeply cyanosed, rolled his eyes and fell back dead Asystole was followed by a fine rumbling sound over the precordium and was interpreted as ventricular fibrillation

Autopsy showed an ancient occlusion at the orifice of the left circumflex artery and mild syphilitic change of the aorta but nothing could be found that might explain the sudden death

Thus two different mercurial diuretics produced almost identical episodes in the same patient, the second ended fatally This caused us to watch patients

Fig 1 (dog 150, weight 7 Kg) —Intravenous soluble pentobarbital anesthesia was given, vagi were severed and 2 cc of salyrgan was injected intravenously. A control unanesthetized sinus arrhythmia, inverted T waves, rate approximately 105. B, control anesthetized QRS shows decreased amplitude normal sinus mechanism with tachycardia, T waves inverted, rate 170. C, after the right vagus was cut P waves increased sharply inverted T waves, rate 160, increased amplitude of QRS. D after the left vagus was cut T waves sharply inverted, rate 164. E during the injection of 2 cc of salyrgan rate 154. F, ten seconds after injection ST segment depressed, changed to ventricular tachycardia. G, fifteen seconds after injection continued ventricular tachycardia and fibrillation. H, thirty seconds after injection ventricular tachycardia and extrasystoles. I one minute after injection ventricular extrasystoles. J three minutes after injection ventricular fibrillation and extrasystoles. K, five minutes after injection ventricular fibrillation. L six minutes after injection respirations ceased, ventricular fibrillation, tracing continued unchanged for five minutes.

more closely following the administration of these drugs and three more deaths have been observed in the last six years.

CASE 2—W G, a man aged 48, entered the hospital with a history of generalized edema associated with a gain of 100 pounds (68 Kg) in two months. Five months previously he had a severe infection of the upper respiratory tract, pharyngitis but otherwise had been in perfect health. There was a questionable scarlet fever in childhood. The patient had a pale, pasty appearance with definite edema of the face, neck, abdominal wall, sacrum and thighs. The blood pressure was 148 systolic and 90 diastolic. The tonsils were small and atrophic, with evidence of infection. The cervical lymph nodes were palpable. The urine contained 4 plus albumin, a few cellular and hyaline casts and doubly refractile lipoid bodies. The specific gravity was 1.022. Blood chemistry revealed blood urea nitrogen of 15 mg per hundred cubic centimeters, phosphorus 3.46 mg, cholesterol 6250 mg and total protein 3.1 Gm per hundred cubic centimeters with inversion of albumin-globulin ratio, the urea clearance was 50 per cent normal, phenolsulfonphthalein excretion was 55 per cent in two hours. The basal metabolic rate was -15. Hemoculture for streptococci were present in cultures of material taken from the throat.

The clinical diagnosis was chronic glomerulonephritis in the nephrotic stage. He was placed on a salt free, high protein diet with 2 Gm of ammonium chloride after meals, but after several weeks there was little improvement. The removal of his tonsils was followed by an acute exacerbation of the glomerulonephritis. During the next four months the disease progressed as indicated by a decreased kidney function, a rise in blood pressure and an increase in the anemia and edema. During this period blood transfusions, hypertonic solutions and diuretics failed to modify the persistent edema. The most helpful treatment had been a low sodium, low phosphorus diet with 2 Gm ammonium nitrate after meals and potassium chloride as a salt substitute. Finally, six months after his admission he decided to attempt a diuresis with the aid of a mercurial diuretic. On the morning this was given the patient was comfortable and ambulatory. Blood pressure was 170 systolic and 100 diastolic and the pulse was 80 and regular. Two cc of mercurpurin was given slowly intravenously (diluted to 10 cc in isotonic solution of sodium chloride). Within five minutes after the administration of the drug the patient, who had been lying in bed, suddenly gasped, stiffened and then relaxed. A period of forceful irregularity of the heart was noted, followed by a decrease and finally absence of any sounds. The patient failed to respond to artificial respiration or intracardiac administration of epinephrine.

This patient in a nephrotic stage of chronic glomerulonephritis, after several months in the hospital on a low sodium, low phosphorus diet, died following the initial injection of 2 cc of mercurpurin. The sequence of events was injection followed in three to five minutes by a gasp, stiffening, relaxation with an irregular cardiac irregularity, then death.

The postmortem diagnosis was subacute glomerulonephritis with parenchymatous fatty degeneration associated with generalized edema, hydrothorax, hepatomegaly, pericardium and ascites. No cause was found for the sudden death. During fifteen years of the use of mercurial diuretics in nephritic disorders this is the first death that could be attributed to the drug.

CASE 3—Mrs M D, aged 64, was admitted to the hospital for the fifth time in two years with a diagnosis of cardiovascular disease with cardiac decompensation. She had been ill for years prior to her first hospital admission and was now bedridden. During this time her family physician had given her ammonium chloride and salyrgan at ten to twenty grains daily.

5 Tyson, Mary Catherine. Danger of Irritation of the Heart in Nephrosis, J A M A 117:998 (Sep. 20) 1941.

of the edema. Subsequent to her first hospitalization the edema free and remained fairly well controlled on a low sodium diet with added ammonium and potassium. Occasional bouts of hypertensive encephalopathy and decompensation necessitated hospitalization.

At the time of her final admission she complained of fatigue, distress and orthopnea. Physical examination revealed the right side of the chest an enlarged liver and The blood pressure was 200 systolic and 115 diastolic. The heart was enlarged to the left and there was a gallop.

The urine contained 2 to 3 plus albumin with rare red cells and hyaline casts. The red blood cell count 3 million and the hemoglobin 9 Gm. During the four of her hospital stay there was a slight progression of renal function and the cardiac status became. The edema became more difficult to control despite and various diuretic salts (ammonium nitrate and potassium nitrate and chloride). During this our intravenous injections of salyrgan and theophylline in 10 cc of isotonic solution of sodium chloride) were without notable diuresis. During the next twenty-eight uretic minerals and digitalis were discontinued. One erginin was given three times a day, since it was believed digitalis had produced nausea. Finally it was decided to mercurial diuretic again and twenty eight days after the injection 4 cc of salyrgan and theophylline was given orally. Two minutes later she gasped and became cyanotic, and a rapid irregularity of the heart promptly developed. After a few irregular forceful ventricular beats there was diastolic standstill, and death occurred within three minutes of injection.

Salient features of the postmortem examination were generalized arteriosclerosis, diffuse fibrosis and hypertrophy of the heart with an old infarct in the intraventricular septum, advanced arteriosclerosis of the kidneys. The general finding was that of chronic passive congestion of the viscera, effusion of fluid in the serosal cavities. Microscopic examination of tissues failed to reveal any cause for the sudden death.

It is estimated that during the five year period this patient had received more than two hundred injections of mercurial diuretics. At the time of her death, her weight was approximately 75 pounds (34 Kg). It is conceivable that the patient received a toxic dose of her reduced body weight or because of the degree of cardiac damage.

4.—Mrs. Z. T. aged 64 with a history of diabetes was admitted to the hospital in a somnolent condition. There was a history of increasing edema of six months' duration. The edema had been controlled by 65 units of protamine zinc insulin daily. The patient had received fifteen injections of mercurial diuretics, but none had been given six months prior to admission to the hospital. On admission she was massively edematous and dyspneic with a history of relative anuria of about 500 cc daily. The blood pressure was 160 systolic and 60 diastolic, the heart was enlarged to the left and the pulse was regular at 100 beats a minute. Examination of the urine was negative for sugar and acetone but it contained albumin. Blood sugar was normal.

It was deemed advisable to add 1 cc of salyrgan through a drip rather than give it directly, in the hope that this injection would produce no ill effect. After thirty minutes, the solution was still running the patient, who had appeared relatively comfortable suddenly gasped for breath, became cyanotic and vomited. A coarse irregular heart action was heard, the pulse became imperceptible and respirations ceased.

Death occurred twenty-two hours after admission. Autopsy showed arteriosclerosis of the kidneys, cardiac hypertrophy and dilatation and pulmonary atelectasis.

This patient was moribund on admission, and death had occurred without any medication, but it is more than a mere coincidence that death

should occur in this manner during the time of injection of the mercurial diuretic.

In view of these clinical experiences it was decided to study the effect of the various mercury salts experimentally on the heart by the electrocardiogram and by direct observation. Mercurial compounds injected intravenously into 30 normal dogs produced death by a particular pattern, namely depression of the T waves, runs of extrasystoles, ventricular tachycardia, ventricular fibrillation and death. In animals under intravenous barbitol anesthesia the mechanism was the same. Similar results were obtained when 4 animals were vagotomized and in 2 animals when the cervical cord

Fig. 2 (dog 50 weight 8 Kg.)—Intravenous soluble pentobarbital anesthesia was given, the spinal cord was severed at the lower cervical region and 2.2 cc of salyrgan and theophylline was given intravenously. A control before the cord was severed, inverted T waves, rate 170. B control after the cord was severed, T waves upright, rate 190. C fifteen seconds after the injection, ST interval depressed and slurred, rate 190, beginning ventricular extrasystoles. D twenty seconds after the injection, ventricular extrasystoles. E thirty seconds after injection, ventricular extrasystoles changing to ventricular fibrillation. F one minute after injection, ventricular extrasystoles. G four minutes after injection, respirations ceased, ventricular fibrillation. H eight minutes after injection, the tracing showed ventricular fibrillation and after four more minutes the only change was decrease in amplitude.

as well as the vagi were severed, and in instances of an isolated perfused heart. It was noted that the sequence of events was almost identical in a large number of instances, and after cessation of all ventricular electrical impulses, as observed by the electrocardiogram, the auricles continued with a regular sinus.

rhythm The observations were made with equivalent amounts of either organic or inorganic mercurial compounds From these studies it is our impression that the mercury ion acts directly on the ventricular muscle to produce ventricular fibrillation and death Complete studies are being published elsewhere

## COMMENT

In a search for common factors and pertinent points in these four deaths following mercurial diuretics we note that all 4 patients had suffered from some chronic wasting disease Edema had been present in variable amounts over many months Each patient had received diuretic salts, chiefly ammonium nitrate and potassium chloride, in variable amounts as a salt substitute The sequence of events leading to death were similar Three patients who had had definite cardiac damage received digitalis occasionally, but none were taking it at the time of death However, 1 patient was taking urginin Two patients had advanced renal disease and a third

DEATHS IMMEDIATELY FOLLOWING  
THE INTRAVENOUS ADMINISTRATION  
OF MERCUPURIN

GEORGE BROWN, MD  
LOUIS FRIEDFELD, MD  
MILTON KISSIN, MD  
WALTER MODELL, MD  
AND  
RALPH M SUSSMAN, MD  
NEW YORK

The fact that there are but few reports of serious accidents following the intravenous administration of mercupurin gives the impression that such reactions are very infrequent Tyson<sup>1</sup> reported two deaths following the intravenous administration of mercurial diuretics (esidrone and mercupurin) to patients with nephrosis She also cites other deaths in the literature from other mercurial diuretics But we know of no reports of deaths following the use of mercupurin in patients with congestive heart failure

Each of us has given a large number of injections of mercurial diuretics during the past six or seven years to patients with congestive heart failure, our combined experience exceeds many thousands of injections, yet none of us had previously seen a serious or fatal reaction It was with great surprise, therefore, that we learned that within a short space of time we had independently observed deaths immediately following the administration of mercupurin A short letter to the editor concerning three of these deaths was printed in an earlier issue of THE JOURNAL<sup>2</sup> Since then we have heard of other deaths and we are able to add the fourth case (case 1)

As far as we can judge, the technic of injection in each instance was satisfactory The injections were made slowly, although not actually timed Needles of small caliber (23 to 26 gage) were used Blood was withdrawn into the syringe and mixed with the mercupurin Since ampules of mercupurin are not "lot marked," it has not been possible to determine whether any one particular lot was responsible for all the reactions Unfortunately, postmortem examinations could not be performed

CASE 1 (Dr Brown)—A man aged 68 with a history of angina of effort for about ten months and acute myocardial infarction for four months before his death had, during the first days following the myocardial infarction, repeated attacks of left ventricular failure For the relief of this he had received ammonium chloride and aminophylline without benefit

On the fourth day of the illness he was given 1 cc of mercupurin intravenously Before the needle could be withdrawn the patient became unconscious, respirations became shallow and the face became very pale The pulse rate fell to 20, 30 beats a minute Within thirty seconds there was a spontaneous recovery, but within the next five minutes this type of syncopal seizure was repeated four times In the intervals between seizures the pulse rate was rapid and became slow during an attack There was full spontaneous recovery after this An electrocardiogram did not give evidence of a block, which was presumed to have occurred during the attack

R \ Mercupurin correspondence J A M A 117 1 1941

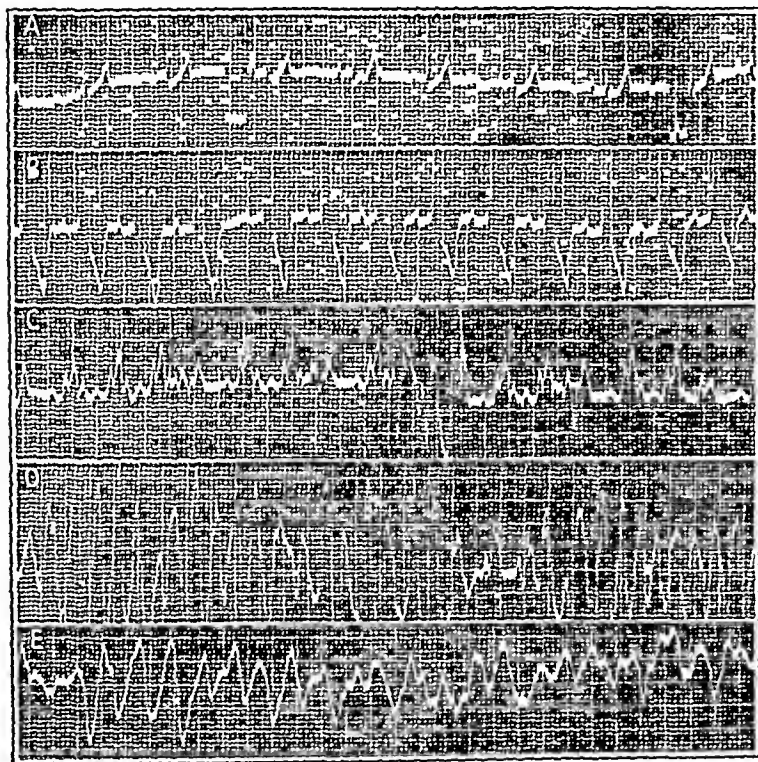

Fig 3 (dog 960, weight 7 Kg) —No anesthesia, 1.4 cc of mercupurin injected intravenously A, control on Sept 3 1941 B, twenty seconds after injection C one minute after injection D two minutes after injection E three minutes after injection respiration ceased at this time, the same type of tracing continued for two minutes, at the end of which time the electrocardiograph was stopped

had moderate cirrhosis of the liver Three of the patients had received numerous injections of different mercurial diuretics (ranging from fifteen to two hundred) while the nephrotic patient died following the initial dose To date we are unable to correlate the method of administration of the drugs, adjunct mineral diuretic salts or changes in the body chemistry with these fatalities Because of the wasting of the body tissue, which is striking in the edematous patient, we were unable to exclude a toxic effect of a relative overdose of mercury Whether in patients or in dogs, death by cardiac arrest is similar regardless of the type of mercurial compound employed

It is far from the intent of this report to deter from the clinical use of mercurial diuretics but rather to emphasize caution in their intravenous use in the waterlogged, wasted patient

About five days later, because of increasing hepatomegaly and dyspnea an injection of mercupurin was prescribed. By error it was given intravenously instead of intramuscularly as ordered. This time there was but a single seizure like that already described lasting about one minute with prompt recovery.

On subsequent examination it was determined that a large ventricular aneurysm had developed. In the ensuing four months there were repeated attacks of paroxysmal dyspnea and pulmonary edema. Mercupurin was given ten times intramuscularly with good diuretic effect and no reaction. During the last episode of pulmonary edema after morphine and oxygen had been given without benefit the physician in charge did not observe the injunction against intravenously administered mercupurin and gave 2 cc of mercupurin intravenously. Within one minute the patient was dead. The pulse and the exact behavior of the patient during this episode were not recorded.

**CASE 2 (Drs Friedfeld and Kissin)**—A housewife aged 52 with a twelve year history of diabetes and a four year history of hypertension had about a year before the final episode suffered an attack of constrictive pain in the chest on walking. An electrocardiogram showed the changes of ventricular strain on the left side seen in hypertension of long duration. About a month after this there was a sudden severe attack of viselike pain in the chest with the typical picture of acute myocardial infarction, although this was not corroborated by the electrocardiogram. Two months later she suffered a pulmonary infarction.

About four months before death the patient was seen in congestive failure: the liver was enlarged and ascites rales in the chest, dyspnea and orthopnea were present. Digitalis was given (1 cat unit daily). Ammonium chloride and mercupurin suppositories were followed by good diuretic effect. Five-tenths cc of mercupurin given intramuscularly was effective and at five day intervals other mercupurin injections were given intramuscularly, until one of them was followed by slough. After this the patient refused to submit to intramuscular injections, so that all subsequent injections were given intravenously.

About one month later 1 cc of mercupurin was given intravenously. From one to two minutes after the completion of the injection severe dyspnea and orthopnea developed. The cardiac rhythm was unchanged and the pulse was of good quality. The episode lasted from two to three minutes.

Despite exceedingly slow injections similar attacks followed seventeen of eighteen subsequent injections, but since the patient steadily refused any but intravenous injections this mode of administration was continued. The dose of mercupurin was gradually increased to 2 cc.

The last injection was 2 cc. In less than one minute the usual dyspnea and orthopnea developed. It subsided and the patient started to chat with her daughter. Suddenly, about three minutes after the completion of the injection, her face flushed intensely and she collapsed. A pulse was not palpable and no heart sounds were heard. After a few gasps the patient was dead.

**CASE 3 (Dr Modell)**—A woman aged 48 with syphilitic heart disease and aortic insufficiency of many years duration suffered from congestive heart failure. After digitalis (2 cat units daily) no longer prevented decompensation and her liver became larger and edema appeared in her legs and lungs she was given ammonium chloride and weekly doses of 2 cc of mercupurin intravenously. During the forty-two weeks preceding her death she had received as many weekly injections with no untoward effect. Each injection was followed by a gratifying diuresis, so that the patient would look forward to her treatment, as fluid accumulated during the week.

The last injection was given in the same manner as all the prior injections had been with the patient sitting. On completion the patient appeared normal. About two minutes later while the patient was resting with her arm crooked to compress the injected vessel, she tapped her physician on the shoulder to bring his attention to her. Apparently unable to speak, she pointed to her chest presumably indicating some type of sub-sternal distress. Then she fell forward. She was placed supine

on the floor. There was no respiration, no pulse, heart sounds were not heard, cyanosis developed rapidly.

Artificial respiration with cardiac massage was attempted for a few minutes without effect. One cc of epinephrine (1:1000) was injected into the heart without effect. Artificial respiration was resumed for about fifteen minutes without avail.

**CASE 4 (Dr Sussman)**—A woman aged 60 with a history of hypertension and myocardial infarction of three years duration and congestive failure for the past two years had during the last year and a half been receiving digitalis and various diuretic drugs. The electrocardiograms indicated myocardial damage and infarction of the anterior and posterior wall. During her stay at a hospital in the early stages of her illness the record states that she received mercurial diuretics intravenously with 'unpleasant effects'. The patient later repeated to her physician that "unpleasant effects" immediately followed these injections. Striking symptoms in this patient were the coldness and pallor of her limbs and face, with intermittent generalized sweating.

When she was discharged from the hospital there was enlargement of the liver. Oliguria was severe except after the administration of mercupurin. During the one month preceding her death she received digitalis (1 cat unit daily), ammonium chloride and weekly injections of mercupurin. Salt and fluid intake were restricted. Her blood pressure for the two weeks preceding her death was low as compared with previous determinations.

Four injections of mercupurin were given to the patient at her home without reaction. The last injection (2 cc) was given by the same technic. Immediately after its completion the patient's face flushed intensely. She made an effort to speak but could not. Her heart rate slowed to about 30 beats a minute. The intensity of heart sounds varied. Cyanosis quickly became more intense. Death occurred within four minutes of the completion of the injection.

#### COMMENT

It is noteworthy that in 3 of the 4 cases presented there was a history of previous reactions following the intravenous administration of mercupurin. In 2 cases a change in cardiac rhythm was observed, on 2 occasions in 1 case.

That the reaction was not due to the theophylline component in 1 case is borne out by the fact that seven times the dose present in 1 cc of mercupurin was given without ill effect (case 1).

Whereas 3 of these patients had received intramuscular injections of mercupurin on numerous occasions without reactions, the intravenous administration was the method used in all the fatal instances. It is also significant that in all the fatal injections the dose was 2 cc.

All the patients were known to have adequate renal function as judged by the specific gravity of the urine. It is also worth noting that in all cases previous injections of mercurials had been followed by generally satisfactory diuresis.

#### SUMMARY

In cases of congestive heart failure the intravenous injection of 2 cc of mercupurin was followed by immediate death.

In 3 of the 4 cases immediate reactions were noted after intravenous injections prior to the final one. These included dyspnea, orthopnea, sweating, pallor, bradycardia and syncope. In no case was there a delayed reaction such as might be due to massive diuresis, loss of chloride or disturbance of the electrolyte balance. In all the patients a satisfactory but not massive diuresis followed previous injections of mercupurin.

Two of the 4 patients had received intramuscular injections with adequate effect and without toxic reactions on previous occasions.

## A REVIEW OF THE TOXIC MANIFESTATIONS OF MERCURIAL DIURETICS IN MAN

ARTHUR C DeGRAFF, M D

AND

J ERNEST NADLER, M D, M E D D S C

NEW YORK

Recent publicity<sup>1</sup> given to sudden deaths which were believed to have resulted from the use of mercurial diuretics prompted us to review the entire subject of the acute toxicity of these drugs. In this issue of THE JOURNAL DeGraff and Lehman<sup>2</sup> have reported the results of experiments on cats to determine the possible mechanisms involved. This report will deal with the various untoward reactions that have been observed in patients. Toxic manifestations other than those of purely local nature, e g at the site of injection, may be roughly divided into two major groups: (1) those not directly related to the diuretic but to the associated diuresis and (2) those directly related to the drug.

First we shall consider the toxic reactions not related to the drug. As early as 1891, Jendrassick<sup>3</sup> in giving mild mercurous chloride to patients with cardiac edema noted an increase in the urinary excretion of water and chlorides. Saxl and Heilig,<sup>4</sup> who were the first to discover that merbaphen (novasurol) caused a strong diuretic response in patients with cardiac edema, also demonstrated not only a relative but also an absolute increase in the chlorides excreted in the urine. These facts have been amply corroborated.<sup>5</sup> Coincident with the diuresis there is a decrease in the blood serum chlorides.<sup>6</sup> This fall in the serum chlorides is due to the fact that the amount of chloride found in the extra urine excreted is greater than that of an equivalent volume of body fluid.<sup>7</sup> Blumgart and his associates<sup>8</sup> found that the fall in serum chloride is secondary to the diuretic effect of the mercurial on the kidney and is not essential for the production of diuresis. Furthermore, Evans<sup>9</sup> observed that the response to mercurials depends on the available supply of chloride and water in the tissues.

Symptoms of chloride depletion may be produced, therefore, as a result of mercurial diuresis. This picture is seen also in other instances of excessive chloride loss, such as in heat prostration and in pernicious vomiting. Thus one may get a syndrome characterized by profound weakness, apathy, somnolence, disorientation, delirium and occasionally coma.<sup>10</sup> Muscle pains, especially in the calf muscles, are frequently prominent.

McCance and Widdowson<sup>11</sup> noted mental symptoms in all cases of experimentally induced salt depletion with dehydration. Poll and Stern<sup>10</sup> reported 7 cases of dehydration following the use of mercurial diuretics in patients with heart failure, and they too were impressed by the mental symptoms, especially the preliminary ones of restlessness and confusion. In the more severe states of dehydration, psychoses sometimes progressing to coma and death may result.<sup>10</sup>

The serum sodium and calcium usually do not change appreciably after mercurial diuresis even though the diuresis may be considerable.<sup>12</sup> Nothmann<sup>13</sup> observed a lowering of serum calcium in a few cases, but in others no change was noted. Spontaneous tetany<sup>14</sup> developed in some instances but was not necessarily associated with a drop in the serum calcium level. Tetany after repeated injections of mercurial diuretics was also noted by Pavel and his associates.<sup>14</sup> Grand mal attacks are said to have been provoked in epileptic patients by mercurial diuresis.<sup>15</sup>

It is quite possible for edema to be still present even though there are dehydration, a negative chloride balance, and hemoconcentration as a result of mercurial diuresis.<sup>16</sup> Thus oliguria or anuria may result from a deficiency of salt to aid in the excretion of water. Unless the mechanism is properly understood in such cases, the dose of the mercurial may be increased or the interval between doses decreased. Then, added to the factor of dehydration may be that of mercury poisoning due to poor excretion of the drug. Hines<sup>17</sup> and Evans and Paxon<sup>18</sup> concluded that azotemia after the use of mercurial diuretics is more likely the result of the rapid removal of large amounts of edematous fluid than the result of damage to the kidney from mercury.

Price<sup>19</sup> reported the development of gout following salyrgan<sup>20</sup> diuresis in 5 patients who had a previous history of gout. He stated that it was not due to mere mechanical concentration of uric acid in the tissues as a result of the diuresis. We observed a patient in congestive heart failure who had a history of gout but were unable to precipitate an attack of gout with repeated profuse diuresis by mercupurin,<sup>21</sup> even though an attack could readily be induced by a high purine diet.

It is evident from the foregoing that, unless the electrolyte and water balance are carefully controlled, symptoms of considerable severity are possible merely as the result of rapid diuresis and not primarily owing to a toxic reaction following the use of a mercurial diuretic. Care must therefore be taken to keep the patient in salt balance. Symptoms such as muscle cramps are usually prevented by the administration of ammonium chloride to replace the chloride lost by diuresis.

Another important toxic manifestation related not directly to the mercurial but rather to the rapid diuresis is digitalis toxicity due to a mobilization of digitalis.

from retained tissue fluids when a fully digitalized patient is given a mercurial diuretic. Miller and Smith<sup>22</sup> found that edema fluids of digitalized patients when tested on the cat contained an appreciable amount of a digitalis-like substance, whereas fluids from controlled undigitalized patients produced no effect. The same effect was later demonstrated by Schnitker and Levine<sup>23</sup> on the Straub heart preparation in the frog. They showed as did Gouley and Soloff<sup>24</sup>, Kissane and Koons<sup>25</sup> and Hyman<sup>26</sup> that redigitalization even to the point of toxicity could be produced as these body fluids found their way back to the blood stream and out through the kidney during a mercurial diuresis. Rapid diuresis in fully digitalized patients may bring on typical signs and symptoms of digitalis toxicity not present prior to the administration of the mercurial diuretic. Our experience is in accord with that of the investigators cited. Symptoms of digitalis toxicity may develop with the loss of considerable edema fluid even though digitalis has not been administered for several days. It is necessary, therefore, that considerable caution be exercised in the administration of a mercurial diuretic to a patient who has been fully digitalized. If the diuretic must be given, a small dose, i. e. 0.5 cc., should be used preferably by the intramuscular route. If appreciable diuresis does not result, larger doses can then be given later.

In common with other potent drugs, cases of individual susceptibility or idiosyncrasy have been noted with the mercurial diuretics. All of the commercially available drugs of this group have at some time or other been reported as producing, in isolated instances, alarming symptoms and even death. In some cases this appears to be a susceptibility to mercury and is noted regardless of the preparation used<sup>27</sup>. In others the reactions seem to be related to the organic structure of the particular diuretic, because another preparation can subsequently be given with impunity (to be discussed later).

Those reactions which seem most clearly related to the mercury itself are the gastrointestinal and the renal disturbances. The effects on the gastrointestinal tract are typically those of mercury poisoning, namely stomatitis, salivation and hemorrhagic colitis. Merbaphen, one of the first of the mercurial diuretics, was the most frequent offender in this regard<sup>28</sup>. The development of stomatitis<sup>29</sup> and excess salivation<sup>30</sup> is not a particularly reliable early sign of mercurial toxicity, for, as Stokes<sup>31</sup> has pointed out, the presence of stomatitis is dependent as much on the bacterial flora of the mouth and incidental conditions as it is on the dose of mercury that the patient is receiving.

With the use of theophylline-containing mercurial compounds, the danger of mercurial poisoning may be

considerably lessened because of the more rapid and complete excretion of the drug<sup>32</sup>.

The changes produced in the kidney by mercurial diuretics consist chiefly in degeneration of the epithelium of the tubules. As a rule, the signs in the urine of renal irritation which occur with use of mercurial diuretics appear in the following order: (1) casts, hyaline and granular, (2) albumin, (3) leukocytes, (4) erythrocytes. Sprague and Graybiel<sup>33</sup> and Herrmann and Decherd<sup>34</sup> have reported mild renal irritation produced by salyrgan, and Herrmann and Decherd<sup>34</sup> and Klinghoffer<sup>35</sup> have noted the same for mercupurin. Brown and Englebach<sup>35</sup> made counts of the urinary casts before and after the administration of clinical diuretic doses of salyrgan to 5 patients with ascites who had no evidence of renal disease. In every instance they found that the count was appreciably increased after the drug was given but that this effect was transient. Hematuria has been noted following the use of merbaphen<sup>36</sup> and salyrgan<sup>37</sup>.

A case of relatively severe renal irritation caused by salyrgan was reported by Derow<sup>38</sup>. In a series of necropsies on 30 patients who received salyrgan during life, Tarr and Jacobson<sup>39</sup> found only 1 patient with a renal lesion suggestive of mercurial intoxication. The risk of uremia as a complication is not great. Hines<sup>37</sup>, Evans and Paxson<sup>38</sup> and Klinghoffer<sup>36</sup> have shown that a rise in blood urea may occur. However, this is generally interpreted as due to rapid removal of edematous fluid with hemoconcentration rather than to kidney damage from the mercurial used.

While toxic anuria has been produced in animals by salyrgan<sup>39</sup> and 2 cases of anuria in man with extensive tubular damage found at necropsy were reported by Schwab and his associates,<sup>40</sup> it appears that extrarenal factors, such as disturbance of the electrolyte balance, are the more likely cause of anuria when present. Parent<sup>41</sup> observed a man aged 64 with coronary arteriosclerosis and previous myocardial infarction who had severe congestive heart failure. Digitalis was no longer effective, so 2 cc of mercupurin was given intravenously. Anuria resulted and the patient died forty-eight hours later in coma with convulsions. Petersen<sup>42</sup> reported that 1 patient with anuria was given salyrgan, and not only was urinary flow reestablished but a satisfactory diuresis was obtained. Apparent anuria may be due to prostatic swelling following the diuresis, as was noted by Tscherning<sup>43</sup> with salyrgan in 4 old men with hypertrophied prostates.

Patients with evidence of kidney damage usually tolerate mercurial diuretics fairly well. However, as will be noted later, it is this group that furnishes us with a large proportion of deaths following the use

of mercurial diuretics. The presence of kidney disease is a contraindication to the use of mercurial diuretics even though many times serious complications may not result.

Mercurial diuretics in common with other compounds containing mercury may on occasion produce cutaneous eruptions.<sup>44</sup> There is a striking variability in the type of reaction produced. Those particularly mentioned in the literature are urticaria,<sup>45</sup> small reddish spots or purpuric areas<sup>46</sup> and morbilliform<sup>47</sup> or scarlatiniform erythema.<sup>48</sup> Occasionally the rash is followed by desquamation in from one to three weeks. Patch tests by Wilson<sup>49</sup> demonstrated that these reactions may be on an allergic basis. In contrast, there may occur in rare instances a severe mercurial dermatitis due to an accumulation of mercury in the body. While the latter reaction was occasionally seen with the older type of mercurial diuretic, it is no longer observed with the rapidly excreted theophylline-containing mercurials.

An erythematous eruption may follow either the first or any subsequent injection of the diuretic. As a possible mechanism, Lesser<sup>50</sup> suggested that the mercury circulating in the blood stream caused paralysis of the sympathetic nerves with consequent vasodilatation. That capillary dilatation is also an effect of mercury on the skin is supported by the histologic studies of Almkvist.<sup>51</sup>

In those persons in whom sensitivity to a mercurial diuretic manifests itself by a rash, changing the route of administration from intravenous to intramuscular or rectal routes is of no avail.<sup>27</sup> While not serious in itself, the occurrence of a rash may be a warning of more serious reactions if one persists in the use of the mercurial. In the case reported by Wolf and Bongiorno,<sup>47</sup> a blotchy rash resembling measles was seen on the face following the fourth injection of salyrgan. The next injection, one week later, caused death within one minute.

Chills and fever have been noted with merbaphen,<sup>52</sup> salyrgan<sup>53</sup> and mercupurin.<sup>54</sup> Coventry<sup>55</sup> noted an elevation of temperature with mercupurin, and Robinson<sup>54</sup> had 1 patient who had a rise in temperature after each injection of mercupurin. The reaction is probably not due to pyrogenic material in the ampule because, in the first place, the maximum volume of fluid injected is 2 cc., and, in the second place, material from the same lot number caused no pyrogenic response in other patients. In some instances at least it would appear that individual susceptibility to a particular preparation is responsible, because changing to another mercurial produced no further reactions. Gold<sup>56</sup> had a patient who had a rise of temperature after the use of mercupurin but failed to get a reaction on changing to salyrgan with theophylline. We had the opportunity to observe a similar situation in a patient aged 68 with

arteriosclerotic and hypertensive heart disease and severe congestive heart failure who received 2 cc. of mercupurin intravenously at weekly intervals. More than sixty injections had been given without untoward effects. About one hour after the next injection rigor and a slight elevation in temperature developed. One week later an injection was followed by a more severe, prolonged rigor with a slight fever. The next dose of mercupurin was given intramuscularly and for the third consecutive week the patient had a chill, this time even more severe than before, and the temperature rose to 102 F. In each instance the temperature was normal the next day and an excellent diuretic response was obtained. Other patients receiving mercupurin from the same batch had no reactions. The next week and subsequently salyrgan with theophylline was given intramuscularly with good diuretic response and no chills or fever.

Reactions resembling a state of shock with chills, sweating, cyanosis, collapse and urinary suppression have occasionally been noted following the use of mercurial diuretics, namely merbaphen,<sup>57</sup> salyrgan,<sup>53</sup> mercupurin<sup>58</sup> and esidrone.<sup>59</sup> While it is generally considered that this syndrome is a direct result of mercurial poisoning, Poll and Stern<sup>10</sup> compare it to the similar clinical picture seen in Addison's disease and believe it to be due to loss of water and chlorides. It should be noted, however, that in many cases the acute reaction is observed long before the onset of diuresis. Another case reported to us by Parent<sup>41</sup> would indicate that here again individual susceptibility to a particular mercurial may be the important factor. His patient was an elderly man who had an old myocardial infarction and general anasarca and who had received several doses of mercupurin intravenously. Because the effect was much less than had been experienced previously, Parent decided to change to esidrone. Immediately after the administration of esidrone (no mercurial had been given for two weeks) the patient began to cough, his breathing became asthmatic, cyanosis appeared, followed by clonic convulsions of the hands and face, and he became unconscious with involuntary urination and defecation. Two minutes later the twitchings ceased, he regained consciousness, but coughing and heavy breathing continued for the next ten minutes. Subsequently mercupurin was again given without any reaction.

The first deaths reported were by Redlich<sup>60</sup> in 1925 from the use of merbaphen. There were three fatalities. In 1 case death occurred after two doses with a three day interval between, in another, a single dose of 1 cc. of merbaphen was followed three weeks later by death, which appeared to be due to enteritis and volvulus.

The next fatality was reported by Wolf and Bongiorno<sup>47</sup> following the use of salyrgan. Their patient was a 4 year old child with nephrosis who was given salyrgan intravenously in gradually increasing doses up to 1 cc., about a week apart. The fourth injection of 1 cc., was followed by a chill in about one hour and a rise in temperature to 102 F. The next morning the temperature was normal, a blotchy rash resembling measles was seen on the face and this was gone by

two days. Within 1 minute after the fifth injection the child coughed, cried and fell dead.

Sundaram<sup>61</sup> reported the death of a boy aged 10 years with rheumatic heart disease who died after receiving his first dose of 0.5 cc of salyrgan. The drug was diluted with 10 cc of water and injected intravenously. In about five minutes the patient complained of a sudden pain in the chest, collapsed and died. Hug<sup>62</sup> reported a similar fatality in 1 case of severe myodegeneration and cirrhosis of the liver but believed that poor liver function contributed to the death. Cadbury<sup>63</sup> had 2 patients with nephritis who died following the use of salyrgan. One girl aged 21 with nephritis was given salyrgan on three occasions; after the last injection of 2 cc intravenously she became dizzy and was dead in five minutes. The other was a 5 year old boy with nephritis; 0.6 cc of salyrgan was injected into the jugular vein, he collapsed and died in ten minutes in spite of epinephrine given intramuscularly and intracardially. Two other deaths have been reported by Barker and his associates<sup>64</sup>.

Sudden death due to neptal<sup>64</sup> was reported in 2 cases by Greenwald and Jacobson<sup>65</sup>. Their first patient was a child aged 2 years with nephrosis who was given 0.5 cc of neptal intramuscularly followed by 1 cc intramuscularly four days later. One week later 1 cc of neptal given intravenously caused dyspnea, cyanosis, cardiac standstill and death within one minute of injection. The second patient was a child aged 3 years with nephrosis who received 0.5 cc of neptal intravenously followed by 0.5 cc given intravenously six days later. Three days later an injection of 0.5 cc intravenously caused a convulsion, dyspnea, cyanosis and coma within two minutes and death in less than five minutes after the injection. They believe that death was due to anaphylactic shock.

The first two fatalities following the use of mercupurin were reported by Engel and Epstein<sup>66</sup>. In the first patient 1 cc was given for edema of cardiac origin and a good diuresis was obtained but two days after the injection an intractable bloody diarrhea developed. Examination of the feces proved negative and the patient died two weeks later. Postmortem examination revealed severe colitis. Though they could not identify the cause of the severe colitis, they did not consider that it could have been caused by a single injection of mercupurin. Their second fatality occurred in a case of bronchial asthma and decompensated arteriosclerotic heart disease. They gave 2 cc of mercupurin intravenously and the patient died suddenly a few minutes after the injection. Postmortem examination revealed high grade narrowing of the lumens of the coronary arteries and extensive myocardial degeneration—a pathologic picture in which, they contended, sudden death frequently occurs even without an injection.

Henszelmann<sup>66</sup> also reported a fatality but did not believe that it was due to the mercurial. Molnar<sup>67</sup> described a man aged 39 who had ascites, syphilitic aortitis and aortic insufficiency. The patient was given 2 cc of mercupurin intraperitoneally and complained of intense abdominal pain immediately after the injection.

Twenty to twenty-five minutes later he became dyspneic and cyanotic and died. Autopsy revealed the presence of syphilitic aortitis but failed to explain the sudden death. Molnar believed, however, that his patient died because of hypersensitivity to the drug. In this regard, it is interesting to note that Petersen<sup>62</sup> injected salyrgan into the ascitic fluid in 7 cases. The administration of the drug by this method did not give any serious side reactions, but it was not of any advantage either, for it failed to give a protracted diuresis. Tyson<sup>67</sup> reported the death of a boy aged 3 years with severe anasarca from nephrosis. He received 0.5 cc intravenously and one month later 1 cc of mercupurin intravenously. As soon as the needle was withdrawn the patient had a generalized convulsion and gave an outcry. The heart beat could not be heard and respirations became slow and stertorous, and he died one minute after the injection. Partial necropsy revealed considerable congestion of the kidneys and typical changes of chronic lipid nephrosis.

Two fatal cases following the use of mercupurin were reported by Lindberg and his associates<sup>63</sup> but details of these cases are lacking. Vaughn<sup>68</sup> studied a 16 year old boy who had been deeply cyanosed since birth and in whom myocardial failure due to a congenital heart disease had developed. He was receiving digitalis and ammonium chloride and was given 2 cc of mercupurin intravenously (which was practically synonymous with intra-arterial injection due to a patent ductus arteriosus). Within two minutes he complained of lumbar pain, became ashen gray and rapidly unconscious and died a respiratory death with severe dyspnea within four minutes of the time of completion of the injection. Hausheer's<sup>69</sup> patient was a woman aged 59 with hypertensive, arteriosclerotic heart disease and considerable renal involvement; she had been receiving digitalis, ammonium chloride and mercurial diuretics (salyrgan and mercupurin) for over three years. Owing to the better diuresis obtained with mercupurin, it was used exclusively during the latter part of her illness. She received from one to three intravenous injections of 2 cc weekly. At the time of her last injection her condition seemed worse than usual, she was literally gasping for breath. Immediately following her usual injection she slumped over and died instantly without a gasp or effort of any kind.

Through the courtesy of the authors we are able to present the pertinent facts about the deaths reported by Friedfeld, Kissin, Modell and Sussman<sup>1</sup>. Friedfeld and Kissin's patient was a woman aged 52 with diabetes, hypertension and arteriosclerotic heart disease. In addition to the mercurial diuretic the patient was receiving digitalis and ammonium chloride. At first mercupurin was given intramuscularly, but because one injection was followed by a slough they changed, on the insistence of the patient, to the intravenous route. The first intravenous injection of 1 cc of mercupurin was followed in from one to two minutes by a sudden paroxysm of urgent dyspnea and orthopnea. The heart rhythm remained regular and the blood pressure was unchanged. This episode lasted from two to three minutes and recurred at almost each succeeding injection despite all precautions. Since the patient persisted in her aversion to the intramuscular injections, and other efforts at diuresis were inadequate, the intravenous injections (increased to 2 cc) were of necessity continued at five day intervals. About four

and one-half months after her first intravenous injection, following the injection of 2 cc of mercupurin intravenously, she presented the usual reaction in about one minute. In another minute this seemed to subside and suddenly, about two to three minutes after the completion of the injection, her face flushed intensely and she collapsed. There were no convulsions. Her pulse was not obtainable and heart sounds were not heard. After a few gasps the patient was dead.

The patient observed by Modell had syphilitic heart disease and had received more than forty injections of mercupurin at weekly intervals with good diuretic response and no unpleasant or untoward reaction. She was also taking digitalis and ammonium chloride. Within about two minutes of completion of the last injection she became breathless, indicated distress in the region of her chest and fell over dead. Artificial respiration, intracardial epinephrine and cardiac massage were to no avail. The heart action had stopped before the respirations. There were no convulsions at any time.

Sussman's patient was a woman aged 60 with hypertension, arteriosclerotic heart disease and old coronary occlusion with persistent right and left sided heart failure. Other than the usual cardiac complaints, she had profuse sweats which seemed at times to be aggravated by intravenous diuretics. For the past year and a half she had been receiving digitalis, ammonium chloride and diuretics. Following her last intravenous injection of 2 cc of mercupurin her face became flushed, she made an effort to speak but could only move her hands. Her heart rate slowed to 30 beats a minute and continued irregular. Respiration became infrequent, progressive cyanosis appeared and death took place within four minutes after the injection. Because of technical difficulty the injection prior to the last one was given intramuscularly.

Goldring and Sussman<sup>70</sup> furnished us with a report that a man aged 60 with arteriosclerotic heart disease and recent myocardial infarction in congestive failure had been given 1 cc of mercupurin with good diuretic response. Twelve days later he was given a second injection of mercupurin, and three hours later he suddenly became dyspneic, syncope developed, and in a few seconds he died.

In reviewing these deaths certain significant facts are apparent. First, some deaths are obviously not the result of the mercurial diuretic, and in others the part that the diuretic may have played in the fatal outcome is decidedly questionable. Second, a large proportion of the deaths occurred in patients with evident kidney disease. It may have been necessary to use a mercurial diuretic in such cases, but the increased risk involved should certainly have been known prior to the injection of the drug. Mercurial diuretics are generally conceded to be contraindicated in kidney disease. Third, several patients had reactions of some type with a previous injection. Such reactions are warning signals of danger, and if mercurial diuretics must be given, then a change to another preparation is indicated. Fourth, some patients were practically moribund on admission. Any drug used might be blamed for the death, posthoc, propter hoc. Fifth, a small group of cases is left in which death unfortunately must be ascribed to the drug itself, and no precautions taken prior to the injection could seemingly have prevented the fatal out-

come. Further investigations on animals may lead to some information which may help to reduce even this small number.

#### COMMENT AND SUMMARY

In a review such as this, one should not lose perspective. One must remember that the toxic reactions and deaths reported from mercurial diuretics are in reality only a small number in relation to the extensive use of these drugs. The low toxicity of the mercurial diuretics has been amply demonstrated by Wiseman,<sup>71</sup> Marx, Scott and Harvey,<sup>72</sup> Dixon,<sup>73</sup> Levine<sup>74</sup> and Fineberg. At Bellevue Hospital approximately 6,000 injections, most of them intravenously, of mercurial diuretics given every year. Since 1934, when mercupurin was first used in that hospital, we have known of no serious toxic reaction or death which might be attributed to the drug. Modell in a personal communication states "I might say that I personally have given over 2,000 injections of mercurial diuretics without any serious mishap prior to the one reported." A comparison with the arsphenamines used in the treatment of syphilis is illuminating. Hahn<sup>75</sup> recently reported an incidence of one death in twelve thousand injections of arsphenamines. While we do not possess accurate statistics relating to the number of injections of mercurial diuretics administered, it can safely be assumed that well in excess of one hundred deaths a year would be attributed to these drugs if deaths occurred at the same rate as follow the use of the arsphenamines. Actually, there has been reported a total of twenty deaths from mercurial diuretics over a period of sixty years.

No deaths have been reported from the administration of the mercurial diuretics intramuscularly or in the rectum, but this may be due to the fact that the intravenous route is by far the commonest method used.

The human liver is apparently much less sensitive to mercurial diuretics than the liver of experimental animals, for though we have carefully looked for liver damage in our patients we failed to observe any. A case of aplastic anemia or granulocytopenia, such as is occasionally seen with mercury in the treatment of syphilis, has been reported in the literature or suggested by us.

Circulatory disturbances, collapse, rigors, fever and more rarely the state suggestive of anaphylactic shock following the use of mercurials are occasionally seen by the intravenous injection of other substances, such as 10 per cent calcium chloride.<sup>65</sup> These reactions are probably no more common than with other potent drugs commonly employed and, although rare, they must be considered carefully in the treatment of a patient. It would seem that the organic portion of the molecule is of considerable significance in determining such a toxic reaction, since the several drugs differ decidedly in their lethal doses<sup>2</sup> and in their ability to produce reactions.<sup>66</sup> When a reaction occurs, another preparation should be cautiously tried. Changing the mode of administration with the same preparation does not seem to help.

Previous medication by digitalis may produce digitalis toxicity but not one of the characteristic mercurial

reactions If a mercurial diuretic must be given to a completely digitalized patient it is advisable to discontinue the digitalis temporarily and remove as much fluid as possible by paracentesis before the mercurial diuretic is given

As in the experimental animal, sudden death appears to be chiefly cardiac, probably ventricular fibrillation, although a few cases would suggest respiratory failure as well

Mercurial diuretics are useful drugs, frequently indispensable, and it would indeed be unwise to restrict their clinical application on account of an occasional untoward reaction It should be borne in mind, however, that these drugs are very potent and they must be used with due consideration to contraindications, associated medication such as digitalis state of salt and water balance and previous reactions shown by the patient

## PNEUMONIA IN ILLINOIS 1938-1941

RENO ROSI, MD

Pneumonia Control Officer Illinois Department of Public Health

O K SAGEN, PhD

Chief Statistician

AND

E A PRANGE, MA

Assistant Statistician

SPRINGFIELD, ILL.

The use of highly refined antipneumococcus serum and the sulfonamide compounds has revolutionized the treatment of pneumonia As most clinical reports have shown, these advances in treatment have occasioned a material reduction in the pneumonia fatality rate Much of this remarkable achievement is the result of well organized pneumonia control programs conducted by public health agencies Yet relatively few reports emanating from these agencies have appeared in the literature

Our purpose in this paper is not only to present the results of the Illinois Pneumonia Control Program but also to encourage physicians in the use of such facilities, where they exist, to a greater degree Although year by year a higher percentage of pneumonia patients have come under the Illinois Control Program, less than 50 per cent are now obtaining the services available

Table 1 exhibits the history of pneumonia in Illinois during the last five years In 1937, the year prior to the institution of the control program, there were 5,512 deaths, giving a fatality rate (per hundred cases reported) of 36.8 per cent During the second year of pneumonia control activity there were 3,738 deaths, with a fatality rate of 25.6 per cent The fatality rate of those cases treated under the program in 1940 was only 8.7 per cent It would seem reasonable to assume that the lowered pneumonia mortality rate during 1940 in Illinois was due largely to improved methods and facilities for the treatment of this disease The advent of therapeutic serum and drugs was undoubtedly the principal factor in the reduction of mortality However,

this result could not have been accomplished without the facilities of the control program The program not only acquainted the physician with the modern methods of treatment but also furnished him with free diagnostic services and therapeutic materials These services were available free of cost for all patients with pneumonia regardless of their financial status

### ORGANIZATION OF THE ILLINOIS PNEUMONIA CONTROL PROGRAM

Prior to 1938 there had been no concerted effort to control pneumonia in Illinois In November 1938 the Illinois Department of Public Health with the cooperation of the United States Public Health Service inaugurated a statewide program for the control of this disease During the first year pneumococcus typing stations as well as distributing centers for serum and drugs were established An extensive educational program was undertaken to familiarize the physicians and the public at large with the new facilities available for the treatment of pneumonia At first only horse serum for the common types of pneumococcal pneumonia was available As concentrated rabbit serum and, later, the sulfonamide compounds were proved efficient by clinical trial, these were also made available for free distribution to all patients with pneumonia

Progress was rapid, and by 1940 there were one hundred and sixty private and state agencies approved to perform pneumococcus typing and twenty-seven strategically located centers authorized to distribute serum and drugs In 1940 the number of typing stations was increased to one hundred and eighty and the

\* Per hundred cases reported

serum centers to thirty-seven For more efficient and rapid distribution the sulfonamide compounds (sulfapyridine and sulfathiazole) were made available at all the pneumococcus typing stations as well as at the serum centers This extensive distribution system provided every area of the state, rural and urban, with readily available specific agents for the treatment of pneumonia The geographic distribution of the pneumonia control centers is exhibited by the accompanying map

### COLLECTION OF DATA

*Source of the Data*—All physicians utilizing diagnostic services or obtaining therapeutic materials from approved pneumonia control centers were required to submit a "physician's pneumonia case report" The physicians cooperated splendidly, and satisfactory reports were obtained for over 90 per cent of the cases To simplify analysis of results, these reports were abstracted and the pertinent information was punched on eighty-column cards Tabulating machines were then used to prepare the reports Cases in which

Dr Roland R Cross Director Illinois Department of Public Health  
Dr J J McShane Chief Division of Communicable Diseases Illinois  
Department of Public Health and the members of the Illinois Pneumonia  
Advisory Board cooperated in making this study possible. Valuable  
clerical assistance in processing data was furnished by the Work Projects  
Administration

the diagnosis of pneumonia was doubtful or in which the outcome was not determinable from the history were eliminated from the series.

**Limitations of the Data**—Case reports were often incomplete, so that many cases had to be eliminated from certain analyses for lack of information on age, interval from onset until beginning of treatment and number of lobes involved. Since case reports originated from many sources, they varied not only in completeness but also in the interpretation of many items. There seems to be no reason, however, to believe that the accuracy and completeness of reporting varied significantly in the groups of patients receiving different kinds of treatment. It is well recognized that there may be selective factors for the group receiving serum and

19.4 per cent (277) of all deaths. In 277 cases a pneumococcus was isolated but could not be classified by the Neufeld quellung reaction and other diagnostic tests into the thirty-three types for which serum was available.

It should be mentioned that more than 10 per cent of all specimens submitted were from children in Cook County Hospital. Thus the relative incidence of types 6, 14 and 19, which are most commonly found in children, is perhaps higher in this series than in others reported.

In this series there were 2,288 cases of non-pneumococcal pneumonia with 225 deaths, giving a fatality rate of 9.9 per cent. A streptococcus was the apparent etiologic agent<sup>1</sup> in 972 cases. Hemolytic streptococci accounted for 217 cases, *Streptococcus viridans* for 262 cases and unclassified streptococci for 493 cases. The respective fatality rates were 10.1, 9.5 and 11.2 per cent. In 134 cases in which staphylococci<sup>2</sup> were isolated there were 26 deaths, giving a fatality rate of 19.4 per cent. No laboratory report was received for 1,156 cases, in which there were 91 deaths, giving a fatality rate of 7.9 per cent.

In 1,515 cases more than one organism was isolated from the specimen submitted. In this group there were 160 deaths, giving a fatality rate of 10.6 per cent.

It has been definitely shown by numerous investigators that certain factors influence the outcome of pneumonia. Our results corroborate these observations, and from the data accumulated we are able to show strikingly the important roles played by several factors. These are (1) age, (2) bacteremia, (3) number of lobes involved, (4) day treatment begun and (5) complications.

**Influence of Age on Outcome**—Data on the effect of age on the outcome of pneumonia are shown in table 3. The results obtained are in agreement with present knowledge of the disease, namely that the prognosis becomes graver as age increases despite the form of treatment used. We may divide our series into three age groups: under 2 years of age, 2 to 39 years, and 40 and over. The respective number of cases and fatality rate are as follows: under 2 years of age, 1,398 cases with 103 deaths (7.4 per cent); 2 to 39 years of age, 7,296 cases with 257 deaths (3.5 per cent); and over 40 years of age, 6,500 cases with 1,034 deaths (15.9 per cent). It should be pointed out that apparently age played an important role in the choice of therapy. Among patients over 40 years of age, 3,178 received combined treatment, as compared with 2,479 who received drug alone. In contradistinction, among patients under 40 years of age, including infants, 3,082 received serochemotherapy while 4,593 received drug alone.

**Effect of Bacteremia and Lobar Involvement on the Outcome**—Although blood cultures were reported for only one fourth of all cases, the 4,140 cultures in this series constitute a sufficient sample to warrant definite conclusions. Of the 4,140 blood cultures, 811 (19.5 per cent) were positive. Of the 811 cases in which the cultures were positive there were 208 deaths, giving a fatality rate of 25.6 per cent. On the other hand, of 1

1 Streptococci were reported on the bacteriologic report as the dominant organism. It should be emphasized that these organisms are the predominant organism isolated from sputum, throat swabs and other specimens, particularly *Streptococcus viridans* and unclassified streptococci, may or may not be true etiologic agents since these are frequently found in the upper respiratory tract of normal persons.

2 The etiologic significance of staphylococci in these cases is questioned.

Geographic distribution of pneumonia control centers in Illinois in 1941

chemotherapy, since it is common knowledge that patients who fail to show a satisfactory response to drug alone are often given serum later.

#### RESULTS

From November 1938 to July 1941 there were 15,448 pneumonia case histories received by the Section of Pneumonia Control under the program. Among the 15,448 cases there were 1,425 deaths, giving a fatality rate (per hundred cases reported) of 9.2 per cent, 13,160 of these cases were due to the pneumococcus (table 2). In this group there were 1,200 deaths, giving a fatality rate of 9.1 per cent. Types 1, 3, 2 and 7 were the most prevalent types encountered and together accounted for 41 per cent (6,409) of all cases and 42 per cent (602) of all deaths. The other common types (8, 6, 4, 19, 5 and 14, in order of their prevalence) accounted for 22.1 per cent (3,409) of all cases and

269 deaths occurred among the 3,329 cases in which the blood cultures were negative a fatality rate of 81 per cent

That the number of lobes involved is an index to the severity of pneumonia is also shown in table 4. Single lobe involvement was twice as frequent as multi-

diminished when treatment is delayed. Of the patients with pneumococcal pneumonia for whom all pertinent data relating to prognostic factors<sup>3</sup> were obtained and who received serum or chemotherapy, 1,963 were treated after the fourth day, with 231 deaths (11.8 per cent fatality rate), as compared with 7,601 treated

TABLE 2—Pneumonia Morbidity and Fatality Classified According to Kind of Treatment for Each Type of Organism

\* Per hundred cases reported

ple lobe involvement, there being 8,482 and 4,704 cases respectively. The fatality rate of 15.7 per cent for cases of multiple lobe involvement was approximately three times as great as the rate (5.7 per cent) for cases of single lobe involvement. In 2,262 cases the number of lobes involved was not reported. In this group there were 203 deaths, giving a rate of 9 per cent.

**Influence of Delayed Treatment on Outcome.**—Our results corroborate the well known fact that the efficacy of any form of pneumonia therapy is decidedly

on or before the fourth day, with 616 deaths (8.1 per cent fatality rate). This is shown in table 6.

**Effect of Complications and Associated Diseases on Outcome.**—As might be expected, patients with complications and associated diseases were definitely poorer risks. Of those who received combined treatment there were 1,685 with complications or associated diseases, of this group 444 died (26.4 per cent fatality rate).

<sup>3</sup> Prognostic factors included age, day of disease treatment was begun, lobes involved and complications.

Among 3 604 patients without complications or associated diseases who received combined treatment only 139 died a rate of 3·8 per cent. Similarly of patients treated with the drug alone 613 had complications and 102 died, a fatality rate of 16·6 per cent as compared with 2,839 patients with uncomplicated pneumonia of whom 53 died, a rate of 1·9 per cent.

COMPARISONS OF METHODS OF TREATMENT

At present much interest is focused on the comparative value of serum plus drug versus sulfonamide compounds alone in the treatment of pneumonia. The

pneumonia control programs should give valuable aid in the solution of this problem. In the absence of adequate controls a valid comparison of therapeutic procedures must allow for compositional differences among the groups considered with respect to factors affecting outcome. Thus some of the apparent superiority of drug therapy alone over the combined method is certainly due to the fact that the patients receiving the combined therapy were more seriously ill. The severity of illness in these patients cannot be measured accurately with present methods. Until the time when precise methods of determining severity of

TABLE 4—Influence of Bacteremia and Lobar Involvement on Mortality

\* A case was included in the Yes group under Complications if at least one of the following items was indicated on the history: bacteremia, diabetes mellitus, heart disease, lung abscess, meningitis, nephritis, pleural effusion, postoperative pneumonia, pregnancy, etc. It is quite possible that cases of unreported complications are included in the groups classified as having no complications. † Per hundred cases reported. ‡ This table includes only the cases for which all of the following items were reported: type of pneumococcus, patient age, sex, lobes involved and time of first treatment in relation to onset of the disease. There were 770 other cases for which some of the items were not reported.

results of laboratory studies show that in general the ideal treatment of pneumonia should include both specific serum and drug. Clinical studies to date, however, have not substantiated this view. The solution of the problem, as Bullowa<sup>4</sup> has stated, will come only after observation of many patients over a period of years. The clinical and statistical studies arising from effective

pneumonia are available, one must be content to measure severity by the presence or absence of prognostic factors. Table 5 shows how the various treatment groups in this study were composed with respect to certain prognostic factors. The factors considered were age, time of disease on which treatment was begun, lobe involved, and complications. Each of the four factors was divided into only two categories, because otherwise a prohibitive number of classes would have been obtained in the present classification. The group having complications

4 Bullowa J G M Osgood E E Bulantiz S C and Brownlee I E The Effect of Sulfapyridine Alone and with Serum on Pneumococcal Pneumonia and on Pneumococcus Injected Marrow Culture. Am J M Sc. 199 364 380 (March) 1940

cially heterogeneous. It is recognized that some of our classifications could be improved particularly by a fuller use of the information available on the amount of drug or serum used, the time of the first treatment and the duration of treatment. A higher proportion of serious cases was found to exist among the patients receiving combined drug and serum treatment than among those treated with drug alone. This is shown by the relative numbers of patients classified in the group of greatest severity of disease, namely persons over 40 with two or more lobes involved and complications present. Out of 666 patients in this category, 546 were treated with both drug and serum and 120 with drug only. Thus among these seriously ill patients there was a selection of  $4\frac{1}{2}$  to 1 in favor of combined therapy. Other classifications relating disease severity to age, number of lobes involved and complications all show that in the presence of unfavorable prognostic factors drug plus serum were more apt to be given than drug alone. Thus, in patients over 40 years of age 51 per cent received combined treatment and 37 per cent chemotherapy only. In cases with multiple lobe involvement 39 per cent were given drug and serum while only 27 per cent were treated with drug alone. Similarly among patients with complications the ratio was combined therapy 32 per cent drug only 18 per cent. The one adverse prognostic factor present to a greater degree in the cases in which only chemotherapy was administered was that of treatment begun after the fourth day of the disease, e. g. combined therapy 16 per cent, drug alone 27 per cent. It is probably of considerable importance to note in this same table 5 that of type 3 pneumonias 62 per cent had combined treatment as compared with 29 per cent who received only drug. The number of patients not given chemotherapy was so small that the percentages for these groups are, in general, insignificant.

*Comparisons by Adjusted Fatality Rates* — As already shown, the patients in the group receiving combined therapy were not distributed in the same way with respect to prognostic factors as the patients receiving sulfonamide compounds alone. To offset these differences adjusted fatality rates\* for each factor are exhibited in table 7.

TABLE 6—Influence of Delayed Treatment on Outcome

| Treatment          | Treated On or Before Fourth Day |        |                         | Treated After Fourth Day |        |                         |
|--------------------|---------------------------------|--------|-------------------------|--------------------------|--------|-------------------------|

| Combined treatment | 4 419                           | 425    | 9.6                     | 870                      | 158    | 18.2                    |
| Drug alone         | 2 565                           | 103    | 4.1                     | 947                      | 52     | 5.5                     |
| Serum alone        | 677                             | 85     | 13.0                    | 146                      | 21     | 14.4                    |
| Totals             | 7 661                           | 613    | 8.1                     | 1 963                    | 231    | 11.8                    |

\* Per hundred cases reported

The adjusted rates are derived from the data of table 5 by first estimating the deaths to be expected among patients in each of the sixteen prognostic factor combinations if all patients with a given combination of prognosis items had received the same treatment. For example, in the first prognostic factor group of 198 cases, on applying the fatality rate of 43.6 per cent for the patients receiving chemotherapy alone 83.6

estimated deaths are obtained. Thereupon the adjusted rates are computed from the expected deaths. Thus a comparison of the two methods of treatment by adjusted rates is in effect a comparison based on a standard group of patients. It is readily seen that a large part of the difference between treatments in the crude fatality rates is due to the variation in com-

TABLE 7—Comparison of Combined Treatment with Drug Therapy Alone in Regard to Factors of Age, Lobar Involvement, Time of First Treatment and Complications as Shown by Adjusted Fatality Rates

| Prognostic Factors                                 | Number of Cases | Adjusted Fatality Rate* |            |

position between the group receiving combined therapy and that receiving chemotherapy alone. The crude fatality rate of 11 per cent for the group receiving both serum and drug is two and one-half times as high as the rate for the group receiving drugs alone (4.5 per cent), while the adjusted rate is only one and one-half times as high (9.4 per cent and 6.6 per cent respectively).

## SUMMARY

1 The Pneumonia Control Program of the Illinois Department of Public Health was initiated in November 1938. From this date to July 1, 1941, 15,448 cases of pneumonia were reported to the Section of Pneumonia Control. Among this number there were 1,425 deaths, giving a case fatality rate of 9.2 per cent. Of this group 13,160 were due to pneumococcus types 1-33, and all but 597 received chemotherapy, serum or both, 1,200 of the total group died, giving a mortality of 9.1 per cent.

2 The most common types of pneumococci in order of their prevalence were 1, 3, 2 and 7. The case fatality rates of these four types were 6.2, 15.4, 10.2 and 6.4 per cent respectively.

3 Cases were studied with reference to prognostic factors, namely age, day of disease treatment was begun, lobe involvement and complications.

4 An attempt was made to assess the value of treatment with serum and chemotherapy by allowing for the combined effects of these four prognostic factors.

5 While the death rate among patients treated with both serum and drug was more than twice that resulting from chemotherapy alone, it was found that the great majority of the most severely ill patients were selected for combined therapy.

6 Further statistical analyses are being undertaken with the purpose of elucidating as far as possible the value of combining serum with sulfonamides in the treatment of pneumonia.

5 A detailed description of such adjustment procedure is given by Pearl Raymond, *Introduction to Medical Biometry and Statistics*, ed. 3, Philadelphia and London, W. B. Saunders Company, 1940, chapter IX.

## Clinical Notes, Suggestions and New Instruments

### ZINC DERMATITIS AN ADDITIONAL HAZARD IN THE AIRCRAFT INDUSTRY

HAL E. FREEMAN, M.D., LONG BEACH, CALIF

The salts of zinc, such as zinc chloride, are widely used in welding in large plane manufacturing, and reactions to these compounds have been reported.<sup>1</sup> However, no recorded instance of reaction to zinc has been found, and I have no previous knowledge of such allergic reaction.

"Kirk'site"<sup>2</sup> is an alloy which is used in the foundry in the preliminary stages of die making. It is composed principally of zinc with a small admixture of aluminum and copper and a lesser amount of magnesium.

At this time of national emergency it seems desirable to record the following case, although it is readily acknowledged that such cases will be rarely encountered.

#### REPORT OF CASE

K. W. W., a man aged 33, was referred for dermatologic consultation by Dr. M. L. Loomis, of the Long Beach medical division of the Douglas Aircraft Company, Inc. The patient was of English descent. His past history was irrelevant. The family history, though, was of interest. He stated that his grandmother, mother and father were sensitive to zinc and galvanized metals. His mother, for instance, could never use zinc coated buckets or tubs for such tasks as laundering without having a dermatitis develop on the exposed parts. There were no other known instances of allergic reactions in the patient or his near relatives.

This man suffered a burn from a splash of hot kirk'site in the bend of the left elbow, and around this, while it was healing, developed an inflammation. Zinc oxide, among other ointments, had been used in the preliminary treatment of the burn.

Examination showed a healing burn about 2 cm in diameter in the left cubital space. There was an erythematovesicular and exudative eruption extending around this slightly keloidal area for 3 cm in each direction.

The Wassermann reaction of the blood was negative, and the urine was normal.

Patch tests with scrapings of kirk'site showed, after fifteen hours, a severe erythema in which a small vesicular eruption was superimposed. The results of a control test were negative.

Improvement was definite but fairly slow while therapy consisted in roentgen radiation and the application of sulfanilamide and bismuth tribromphenate in a cream locally, and it was more rapid when weak silver nitrate compresses were used. Alibour water (water containing zinc and copper sulfates) was carefully avoided. During treatment, when the patient was away from the plant considerable improvement would be noticed, and when he would return the involved areas would become pruritic "in about thirty minutes." For this reason it was necessary for Dr. Loomis to have him transferred from the foundry to another department where there would be no exposure to zinc.

After the eruption had entirely healed, and thirty-four days after the original patch test had been applied, patch tests with the constituents of kirk'site were applied. Those with aluminum, magnesium and copper gave negative results after forty-eight hours, while that with zinc showed, after eighteen hours, a bullous reaction, which later became a 5 mm deep slough and required another two weeks to heal.

At the time of the last mentioned reaction edema, erythema and pruritus occurred at the sites of the original patch test with kirk'site on the same (right) forearm and of the original dermatitis on the left arm.

#### COMMENT

Sensitivity to zinc must be regarded as very rare. It has been suggested<sup>3</sup> that the dermatitis may have been due to the formation of zinc chloride from zinc reacting with perspiration. This cannot be disproved, as of course perspiration would occur under a patch test, but it is true that similar scrapings of kirk'site have been applied as patch tests on several other persons without inducing any reaction. Zinc chloride is a primary irritant, and these negative results in other persons would indicate that there was a true zinc sensitivity in this case and that the reaction was not due to zinc chloride.

The flare-up at the previously involved sites when the zinc patch test was applied emphasizes the truly allergic nature of the reaction. This phenomenon has been previously described as the recurrent patch test reaction.<sup>4</sup>

### RENAL TORSION WITH ISCHEMIA CAUSING HYPERTENSION

LESTER A. RISKIND, M.D., LOS ANGELES

AND

H. HARVEY GREENE, M.D., BALDWIN PARK, CALIF

This report is presented because of its unusual bearing on renal hypertension. The major implications seem consistent with scientific validity.

Since Goldblatt's work, impetus has been given to research on hypertension, and a great many articles have been written on the association of disorders of the kidney to high blood pressure. McCann<sup>1</sup> postulated the following events in cases of nephropathy exhibiting orthostatic hypertension:

"1. Erect posture causes some slight interference with the afferent blood supply in consequence of which renin is produced."

"2. The action of renin results in constriction of the afferent arteria in both kidneys with the result that the total renal blood flow is still further decreased, while at the same time the glomerular filtration remains relatively constant, owing to the compensatory effect of increased intraglomerular pressure."

In his series of 5 cases in which nephropexy was performed or kidney belts were applied the hypertension still existed to a lesser degree, but symptomatically there was much improvement.

#### REPORT OF CASE

A well developed woman aged 47, first seen Nov. 7, 1938, complained of severe headaches, nervousness and severe hot flashes. The headaches, which had become much more severe during the last three months, started one week before the expected menstrual period and lasted throughout. The symptoms had been present for two years but had been milder. The menses had become scanty during the past two years but were still regular every twenty-eight days. Physical examination was essentially negative except for a blood pressure reading of 180 systolic and 110 diastolic. Urinalysis was entirely negative. The impression at this time was that the climacteric had started, and until March 1939 estrogenic substances in the form of theelin and amniotin were given. During this period the blood pressure varied from 170/100 to 160/110.

1. Schwartz, Louis, and Russell, John P. Skin Hazards in Airplane Manufacture, *Pub. Health Rep.* 56: 1581-1593 (Aug. 8) 1941.

2. "Kirk'site" is supplied by Morris P. Kirke & Son, Inc., Los Angeles.

The flashes and nervousness were greatly relieved and the headaches were milder.

In September the patient complained of dizzy spells, tiredness, fatigue and swelling of the ankles. For the past two months she had been menstruating profusely every eighteen days. A second degree anemia was noted. Vaginal examination revealed a small normal anteverted uterus. Roentgen therapy was instituted for the menorrhagia and complete cessation of the menses occurred by December 15. The blood pressure was 180/100.

The patient felt well until Jan 20 1940 when she again complained of severe occipital and frontal headaches that came on at frequent intervals and were associated with nausea and vomiting. Hot flashes became intense thirty to forty a day. The blood pressure was 180/100 otherwise physical examination was negative. Estrogenic therapy was reinstituted, large doses being given with relief of the flashes but no apparent relief of the headaches. Morphine sulfate  $\frac{1}{4}$  gram (0.016 Gm) and soluble pentobarbital 4 to 6 grains (0.26 to 0.4 Gm) were taken for relief. The blood pressure at this time was 220/120. A mixture of theobromine and phenobarbital was given as a vasodilator but caused no effect on the headaches or blood pressure. Urinalysis was still negative, nonprotein nitrogen of the blood was 40.8 mg and creatinine 1.2 mg. The climacteric symptoms were controlled with 1 mg of diethylstilbestrol daily. Complete bed rest was instituted the patient improved and the blood pressure dropped to 180/190. Bed rest in a completely horizontal position relieved the patient to a great extent.

In September 1940 tenderness was noted for the first time over the left kidney region and a genitourinary study was advised. The only other urologic symptoms were nocturia one to three times and a dull pain over the left kidney. A memory of attacks of kidney trouble twenty-five years previously was elicited otherwise the past history was negative.

Fig 1—Normal extrarenal pelvis horizontal

The blood pressure prior to urologic study was 240/120. The essential cystoscopic observations were that a number 6 catheter passed to the right pelvis easily but met resistance in the entire length of the left ureter. Phenolsulfonphthalein appeared in three minutes and in excellent concentration from both sides. Urine from both the right and the left kidney was normal. The

retrograde pyelogram revealed normal appearing extrarenal pelvis. In the upright position on the right side a torsion of 45 to 60 degrees of the pelvis was noted while the left side showed delayed emptying time probably owing to the narrowing of the left ureter. The diagnosis of torsion of the right kidney

Fig 2—Torsion of right kidney in upright position

and narrowing of the left ureter was made. Basing our supposition on the fact that torsion of the right kidney might cause a rotation of the renal artery on a fixed axis resulting in a twist which would cause an obstruction to the renal blood flow, recommendation was made by the urologist that the left ureter should be dilated periodically. The torsion of the right kidney, it was suggested might be prevented by using a kidney belt or corset which should be applied while the patient was in bed.

With the application of the corset, the patient was decidedly benefited and three weeks later the patient asked permission to make an automobile trip back East. Since then the blood pressure has stayed fairly close to normal except for an occasional upset. Once when the patient removed the belt for a day the symptoms recurred with a blood pressure of 220/120. Another time when the patient fell and hurt her back her blood pressure was 200/100.

On Oct. 23 1941 the patient said she was feeling well once in a while a severe headache occurred and then her pressure would go up a little. It descended to 154. She reported that she tried taking the belt off for just one day and the pressure went up to 190 immediately.

#### COMMENT

This case presents many problems, as hypertension occurs in the menopause and may be just temporary. The pathologic condition of the kidney has probably been present for many years and it may have been exacerbated by the climacteric. Regardless, the pressure of the belt can be said to have forced the rotated kidney into place, thereby renewing the normal status of the renal blood flow. The only experimental observation was incidental when the patient removed her belt or fell, resulting in a rise in blood pressure.

**Special Article****HANDBOOK OF NUTRITION· III****ROLE OF FAT IN THE DIET**W R BLOOR, PH D  
ROCHESTER, N Y

*These special articles on foods and nutrition have been prepared under the auspices of the Council on Foods and Nutrition. The opinions expressed are those of the authors and do not necessarily reflect the opinion of the Council. These articles will be published later as a Handbook of Nutrition—Ed*

Fat is used biologically mainly as a source of energy and as a constituent of the body tissues. It has minor functions, such as carrying important accessory substances. Weight for weight, fat supplies about twice the energy of the other staple organic foods, carbohydrate and protein. It is an essential in the structure and functions of all tissues and especially of the brain and nerves. The natural fats contain many of the vitamins which are necessary for the growth, maintenance and well-being of animals and probably plants as well. Fats serve passively as heat insulation under the skin, as padding to keep the bodily organs and blood vessels and nerves in place, and for rounding out the angular contours of the bodily structure. They constitute the most important form of stored energy for tiding the animal over through periods of food scarcity and for transmitting to the offspring, as milk or egg, food material to serve until the young animal can forage for itself. Most fats are readily synthesized by animals from other foods but there are certain important exceptions, fatty acids, which must be supplied in the food and the lack of which produces the fat deficiency disease. Fat is thus an important source of energy both immediate and remote. As ordinarily used, mixed with considerable other food, it is completely and easily digested and used. When used alone or when it is the main food constituent of the diet, it is less well used and may cause important disturbances in the organism.

The proper understanding of the part taken by fat in the life processes of animals requires a consideration of the chemical nature of fat and its various related substances and the changes which they undergo in their use by animals. The characteristic constituents of the group comprising the food and body fats and related substances (ordinarily grouped under the name of lipids) are the fatty acids. These are monobasic straight chain acids, two to twenty-four or more carbon atoms in length, some of them with from one to six unconjugated double bonds per molecule. The commonest ones in both food fat and body stores are palmitic ( $C_{16}H_{32}O_2$ ), oleic ( $C_{18}H_{34}O_2$ ) and stearic ( $C_{18}H_{36}O_2$ ) acids with linolic ( $C_{18}H_{32}O_2$ ) and palmitoleic ( $C_{16}H_{30}O_2$ ) close seconds and a variety of others mostly confined to some tissue or fluid in the organism. Some of these are butyric ( $C_4H_8O_2$ ) found in milk fat, arachidonic ( $C_{20}H_{32}O_2$ ) in brain, liver, muscle and other tissues, lignoceric ( $C_{24}H_{48}O_2$ ) in brain and nerve, and cerebronic ( $C_{24}H_{48}O_3$ ),  $\alpha$ -hydroxylignoceric,<sup>1</sup> in brain. For the complete list and for other detailed information regarding classification of the fatty acids

and their compounds, the reader is referred to the numerous good textbooks of biochemistry.

Melting points of the fatty acids depend on the length of chain and on the number of double bonds. The longer the chain the higher the melting point, while double bonds lower the melting point. Thus stearic acid ( $C_{18}H_{36}O_2$ ), a long chain saturated acid, has a melting point of 69.5 C, while lauric acid ( $C_{12}H_{24}O_2$ ) melts at 43.6 C and oleic acid ( $C_{18}H_{34}O_2$ ), corresponding to stearic acid but with one double bond, has a melting point of 14 C, the double bond lowering the melting point about 55 degrees C. Since the melting points of the constituent fatty acids determine the melting points of the fats and since the stored fat must be kept fluid while the animal is alive, there is often a careful adjustment of the fatty acid mixture in the fat stores.

The fatty acids exist in various types of combination in the animal body. Most common of these is that of the fats, also called neutral fats, which are triglycerides of the fatty acids. These are compounds in which the trihydroxy alcohol glycerol is combined in ester combination with three fatty acids. In nature these three fatty acids are rarely the same. Often three different fatty acids are found and in general (Hilitch's rule)<sup>2</sup> there will be as great a variety of fatty acids in the triglyceride molecule as are available to the animal at the time the fat was synthesized. The selection is also controlled by the necessity of a balance between saturated and unsaturated acids or perhaps by the requirement that the completed triglyceride have a melting point not far from the body temperature of the animal. The fact that these esters as well as the fatty acids themselves generally have two and sometimes more melting points some distance apart and that they can be kept in a greatly supercooled condition for long periods of time are facts which require something more complicated than the simple triester type of formula. Evidence points to the occurrence of the esters in several polymorphic forms.<sup>3</sup>

The formula for a typical fat unit is

which would be called palmitodioleim. The naturally occurring fats generally contain several varieties of such units.

In all living organisms fatty acids occur in several types of combination in addition to that in the fat and, since these compounds are now believed to be either stages in the progress of the fats through the processes of metabolism or important constituents of the living cells, it is necessary to include them in the discussion. These compounds include the phosphorylated fats or phospholipids, found everywhere in animal tissues, the cerebrosides, which contain a fatty acid combination, found in the brain and liver, and cholesterol, which always occurs along with the fats, generally free but sometimes in ester combination with the fatty acids, as in the cholesterol esters of the plasma.

## PHOSPHOLIPIDS

The phospholipids or phosphorylated fats call for an extended discussion, since they are connected with the fatty acids in several stages of their metabolism and are important cellular constituents. Phosphoric acid has long been recognized as one of the necessary food constituents of both plants and animals but only recently has light been thrown on just why it is so necessary. Thus the part which it takes in the metabolism of the carbohydrates has been well worked out, and although the picture is incomplete in some details enough has been shown to indicate that the phosphoric acid takes part in most of the stages of carbohydrate metabolism. In fat metabolism only the first stages of phosphoric participation are known. There are three main types of phosphorylated fats, the first two lecithin and cephalin being very similar in composition while the third one sphingomyelin is quite different. Since different fatty acids enter into each of these compounds, there are several members of each group.

Lecithin is believed to have a composition represented by the formula

This would be called palmito-oleo-lecithin. As may be seen, it is an ordinary fat with one of the fatty acids on the glycerin molecule replaced by phosphoric acid in combination with the base choline.

Cephalin is believed to differ from lecithin only in the nature of the base in combination with the phosphoric acid, which in this case is either aminoethyl alcohol ( $\text{CH}_2\text{OH} - \text{CH}_2\text{NH}_2$ ) or its carboxylated form, serine. There are two forms of both lecithin and cephalin the  $\alpha$  form in which the phosphoric group is on the terminal carbon of the glycerin and the  $\beta$  form in which it is on the middle carbon. Both forms occur in tissues and it is significant that  $\alpha$ -lecithin and  $\beta$ -cephalin disappear during starvation, while the  $\beta$ -lecithin and  $\alpha$ -cephalin persist.\*

The third phospholipid, sphingomyelin, as the derivation of the name indicates, is still the "mystery" substance. It is found mainly in brain and nerve and in small amounts in other tissues including the blood. The present accepted formula is

It would be called lignoceryl-sphingosine-phosphoric-acid-choline-ester. It is made up of the two bases sphingosine, which is an unsaturated  $\text{C}_{18}$  chain with one amino and two hydroxyl groups, and choline, both of which are united to the phosphoric acid by ester linkages. It contains one fatty acid ordinarily the saturated lignoceric ( $\text{C}_{24}\text{H}_{48}\text{O}_2$ ), united with the sphingosine as an acid amide, and often another fatty acid united by an ester linkage with the other hydroxyl

group. The fact that sphingomyelin sometimes contains two fatty acids and sometimes only one<sup>5</sup> indicates that it may be of importance in the transport of fatty acids. The fact that the fatty acid in ester linkage may be detached by alkaline hydrolysis or by lipases, while the amide linked fatty acid is not affected is of unknown significance. Fragments of sphingomyelin, e.g. lignoceryl sphingosine, were found by Thudichum in brain and later by others in liver,<sup>6</sup> and sphingosine phosphoric acid choline has been reported in kidney.

A significant difference between the phospholipids and the fats is that the phospholipids contain groups which have a strong affinity for water (phosphoric acid and bases) which render the phospholipids miscible with if not actually soluble in water. The phospholipids thereby provide a physical link between the water insoluble fats and cholesterol on the one hand and the tissues and fluids of the animal body which are either water soluble or mix readily with water. Phospholipids and cholesterol are found in cell walls and membranes and because they are intermediate in properties between the water insoluble fats and the watery environment, undoubtedly serve to regulate the passage of water and water soluble material as well as to facilitate the passage of fat in and out of such cells as those of the intestinal epithelium, the liver cells and the cells of the fat stores. In the intestine this passage appears to be brought about by processes of hydrolysis and resynthesis in which the phospholipids take part, and the same may be true in the case of other cells. One of the impressive phenomena of cellular processes in general is the ease with which hydrolysis and recombination take place. Lecithin and sphingomyelin are nearly neutral substances, for although they contain strong acidic and basic groups these appear to be internally compensated either by union of the opposing groups with loss of water or by the zwitterion form. Cephalin, on the other hand, may be titrated as a monobasic acid, since the bases which it contains, aminoethyl alcohol or serine, are too weak to interfere with the titration of the strongly acidic third hydrogen of the phosphoric acid. Its acidic character gives it the power to combine with the basic groups of proteins and with metals, a fact which may explain its importance in such processes as blood coagulation. The fact that cephalin sometimes contains serine and sometimes the decarboxylated base (aminoethyl alcohol) may explain the fact that when it is too highly purified it is no longer effective in blood coagulation.

Lecithin and cephalin exist in living organisms almost entirely in the "complete" form, i.e., have their full complement of fatty acids and base. Under certain circumstances they may lose one fatty acid becoming lysolecithins and lysocephalins, or they may lose the base, becoming phosphatidic acids. Lysolecithin and lysocephalin are highly dangerous substances because, as their names indicate, they bring about extensive lysis and destruction not only of red blood cells but of tissue cells as well. The increased affinity for water which the loss of one fatty acid confers makes them excellent wetting agents with the result that, entering the cell wall they upset the water balance between cell and fluid, causing swelling and bursting of the cells. Much of the destructive power of some snake venoms is due

to the fact that they contain an enzyme which produces these lyso compounds. Phosphatidic acid is not known to occur in animals but is found in plant leaves.<sup>7</sup>

Sphingomyelin may take on an extra fatty acid in ester combination at its second hydroxyl group<sup>8</sup> and, since this acid has been found to be one of the common fatty acids (palmitic), it seems likely that sphingomyelin takes a more active part than has been supposed in the processes of fat metabolism.

Lecithin and cephalin in the living organism appear to be very labile substances, exchanging their fatty acids and their phosphoric acid with similar materials coming in with the food. The exchange of fatty acids takes place rapidly in the intestinal epithelium, in fact, it appears that this passage of fatty acids into and out of the framework of the epithelial phospholipids is the method or an important method of fatty acid absorption. Phosphoric acid of the food also has been shown to exchange with the phosphoric acid of the cellular phospholipid. These exchanges have been satisfactorily demonstrated by the modern use of labeled or tagged fatty acids and phosphorus as food. The fatty acids used were those of cod liver oil and elaidin by Sinclair,<sup>9</sup> the latter prepared by treatment of ordinary olive oil with nitrous acid. The phosphorus used was the P<sup>32</sup> isotope, which is radioactive and has been used as a tracer substance in fat metabolism by several investigators, notably Chaikoff and his associates,<sup>10</sup> and in this laboratory by Haven.<sup>11</sup> Other labeled fatty acids which are satisfactory are those containing conjugated double bonds, either natural as in tung oil or artificial as produced by prolonged saponification of corn oil. These have been used by Buri and his associates.<sup>12</sup>

Rapid exchanges were found also in the lipids of liver in the case of both fatty acids and phosphoric acid and considerably less rapid in muscle and most other tissues. Brain, nerve tissue and testicle have a very slow exchange. The significance of these exchanges in the tissues is not yet understood, but they emphasize the fact that the fatty acid compounds in tissues are quite labile, giving up or taking on new units according to the supply from the food. This conception of ever labile compounds has been found to hold also for the body proteins<sup>13</sup> and is compatible with the fact that chemical processes in the animal body must be carried on without the usual laboratory aids in bringing about chemical changes, i. e., heat, strong acids, bases or other strong reagents. The warm blooded animal body is a well regulated thermostat kept at about 37 C and likely to be severely damaged by temperatures much below and especially much above that "normal" level. The body fluids are very nearly

neutral in reaction and are similarly regulated about the neutral point. Close regulation extends also to concentration of the various bodily constituents and to the balance between fluids inside and outside the cell. Consequently the body components must be such as can undergo fundamental transformations readily under narrowly limited conditions.

Although free exchange has been established of the various constituents of the phospholipids (at least of lecithin and cephalin) with the incoming ones from the food, certain preferences have been established. Thus Sinclair<sup>14</sup> found that, although the fatty acid constituents of the phospholipids of the intestinal mucosa, liver and muscles changed in response to the fatty acids of the food, the more highly unsaturated fatty acids of cod liver oil were taken up more rapidly and retained more tenaciously than other fatty acids. The special desirability of highly unsaturated acids as phospholipid constituents fits in with other findings regarding the tissue phospholipids—their ready oxidizability in air and hence the difficulty of preparing them in even approximately pure form.

The need of the organism for the more highly unsaturated fatty acids finds expression in the fat deficiency disease which develops in experimental animals as the result of the lack of certain necessary fatty acids in the diet<sup>15</sup> and is cured by the addition to the diet of these acids or acids from which the essential ones can be made. MacLean and her associates<sup>16</sup> have suggested that the essential unsaturated acid is arachidonic (C<sub>20</sub>H<sub>32</sub>O<sub>2</sub>) a four double bond acid which the organism can manufacture from those acids, linoleic and linolenic, which cure the fat deficiency disease.

#### CHOLESTEROL AND CHOLESTEROL ESTERS

Cholesterol (C<sub>27</sub>H<sub>46</sub>OH) has the formula shown

It is a member of the large group known as sterols and is part of a still larger group known as the steroids or sterids. Also members of this group and chemically closely related to cholesterol are the bile acids, the sex hormones and substances occurring as glycosides in such compounds as digitalis and toad poisons. Whether cholesterol can be changed into these important substances or has any physiologic relation to them has not been shown. Cholesterol is connected with the fats in their role in the animal organism because it always occurs along with them and combines with the fatty acids to form the cholesterol esters. The cholesterol esters occur normally in notable amounts in blood plasma and the adrenal cortex, but in almost

conditions they are found in deposits in various parts of the animal body—in the liver in fatty livers especially when caused by cholesterol feedings in the walls of diseased arteries either as mushy deposits (atherosclerosis) or in the actually hardened arteries<sup>17</sup> and in gallstones. Cholesterol and cholesterol esters are among the lipids present in the deposits of Niemann-Pick and Schuller-Christian diseases and in the blood and skin and joint nodules of essential hypercholesterolemia. Whether the cholesterol esters of these deposits represent normal stages in the metabolism of the fats or whether they represent a mechanism for the disposal of cholesterol or unusable fatty acids remains unsettled.

The fact that the cholesterol esters of the blood plasma constitute from 60 to 70 per cent of the total plasma cholesterol and the fact that the cholesterol absorbed through the intestine is esterified with the absorbed fatty acids to about the same extent<sup>18</sup> indicate that it is concerned with the transport if not the metabolism of the fatty acids. Recent work<sup>19</sup> as well as older work<sup>20</sup> indicates that the fatty acids in combination with the cholesterol are relatively highly unsaturated (average about two double bonds) which leads to the belief that the cholesterol combination has to do mainly with the more unsaturated acids. The presence of cholesterol esterases in blood and tissues is the basis for Sperry and Stoyanoff's<sup>21</sup> conception that since cholesterol esters exist in the blood but not in normal tissues, these enzymes are responsible both for the cholesterol-cholesterol ester equilibrium in the blood and also for the breaking up of the ester in its passage into the tissues.

Animals vary a good deal in their ability to absorb and metabolize cholesterol. Herbivorous animals such as the rabbit absorb it slowly and, having absorbed it, have difficulty in disposing of it. In these animals it raises the blood cholesterol and is deposited in characteristic fashion in arterial walls and other places. In omnivorous or carnivorous animals such as the human being and the dog, moderate feeding of cholesterol has no effect on the blood cholesterol nor has it been shown to have any effect on the arterial walls. Gallstone formation has also been shown to be independent of the cholesterol level in the diet. The reason for the lack of effect of dietary cholesterol in omnivorous and carnivorous animals lies in their ability to excrete the excess by way of the intestine. Animals can oxidize cholesterol but slowly. Normally the excretory mechanism is adequate to keep the body in balance as regards cholesterol, but under some circumstances it can be overloaded, with the result that the level of blood cholesterol rises. It has been shown that animals can manufacture cholesterol as needed from compounds of relatively small molecular size.<sup>22</sup>

Cholesterol is confined to the animal kingdom. In plants and bacteria there are other but closely related sterols which presumably have a similar function in their life processes. All available evidence indicates

that animals cannot use these sterols in place of cholesterol, in fact cannot absorb them from the alimentary tract.

With the exception of the adrenals the cholesterol is normally present in the cells and tissues almost entirely in the free form, while in the blood plasma it is about two-thirds combined with fatty acids as esters. Various figures are available regarding the content of cholesterol in normal human blood the differences being due to a number of causes. Differences in analytic method will explain some of the divergence—for example digitonin precipitation method always gives lower results than the colorimetric method based on the Liebermann-Burchard reaction. Since even the digitonin method is not specific for cholesterol, it seems likely that true cholesterol values have not yet been found. The relative values reported are, however, probably as useful for most purposes as absolute values.

Diet undoubtedly plays a considerable role in blood cholesterol values, especially in herbivorous animals, although moderate effects are demonstrable in omnivorous and carnivorous animals as well.

The thyroid secretion appears to have an effect on the blood cholesterol level. Hyperthyroidism lowers blood cholesterol as though the more intense metabolism in this condition resulted in a more complete combustion, while in hypothyroidism the blood cholesterol level is higher. Since all workers have not obtained pronounced differences, the thyroid effect should be regarded as probable but not invariable.

In the variety of nephritis commonly called nephrosis, the blood cholesterol values may reach very high levels, five or six times the normal, and are accompanied by fatty (cholesterol ester) deposits in the kidneys. The reason for the high values is unknown.

In diabetes before the insulin era cholesterol and fat values in the blood were often very high, but with insulin treatment and inclusion of carbohydrate in the diet these high values are exceptional. The earlier values were undoubtedly due to the unbalanced, excessively high fat diet.

Essential hypercholesterolemia in human beings appears to be analogous to the state of affairs found in normal rabbits—a very low ability to destroy or excrete cholesterol. The result is that the cholesterol of animal food accumulates in the blood, resulting in excessive values and in deposits of cholesterol similar to the tophi of gout in various places in the body such as the joints and tendons. The symptoms are relieved by giving the patient a vegetable diet (plant sterols not being absorbed), but the disappearance of cholesterol from the nodules is a very slow process.

Cholesterol mostly in the free form, is found in all bodily tissues being especially abundant in the adrenals (1.5 per cent, mostly as ester), brain (1 to 1.5 per cent, all free), liver (0.3 per cent) and blood (about 0.2 per cent, two thirds as ester). The cholesterol content of muscle varies with the type of muscle, with the species and with activity. Smooth muscle has the highest content (0.18 to 0.2 per cent moist weight), ventricle muscle (0.14 to 0.2 per cent moist weight) and skeletal (0.07 to 0.09 per cent moist weight).

Hen's egg yolk contains about 1.5 per cent of cholesterol, which would amount to about 0.3 Gm. per egg. Milk contains about 0.02 per cent, amounting to about 0.2 Gm. per quart.

The human being loses by the feces about 1 Gm. of sterol daily, most of which arises in the food either

as cholesterol in animal food or as unabsorbed sterols in the vegetable part of the diet

In most body tissues and fluids there is a well defined balance or ratio between the phospholipid and cholesterol. This ratio varies for different tissues but is fairly constant and characteristic for a single tissue.

In the accompanying table the phospholipid content and the phospholipid/cholesterol ratios are arranged in the order of magnitude. As may be seen, there is almost a reversal in the relative position of the brain and the muscle in the two columns of the table. Brain, which has the highest phospholipid, has the lowest phospholipid/cholesterol ratio, owing to its high cholesterol content, while voluntary muscle, which has the lowest phospholipid content, has nearly the highest phospholipid/cholesterol ratio, owing to its still lower cholesterol content. The position of the other items in the table is practically the same in the two columns. Among the muscles the ratios for skeletal muscle and heart are the same (14 to 16), while for smooth muscle the ratio is 4, owing to the much higher content of cholesterol, the phospholipid value being about the same as in skeletal muscle. The high cholesterol is thought to be related to the automatic character of the muscle. Smooth muscle contracts regularly independently of

*Phospholipid/Cholesterol Ratios*

| Phospholipid Content<br>% Moist Weight |         | Phospholipid/Cholesterol<br>Ratio |     |
|--|---------|-----------------------------------|-----|
| Brain                                  | 4.0     | Liver                             | 18  |
| Liver                                  | 3.0     | Voluntary muscle                  | 16  |
| Heart                                  | 1.8     | Heart                             | 16  |
| Kidney                                 | 1.4     | Kidney                            | 11  |
| Lung                                   | 1.2     | Lung                              | 6   |
| Serum                                  | 0.2     | Serum                             | 2.5 |
| Voluntary muscle                       | 0.5-1.0 | Brain                             | 2.5 |

external nervous stimuli. Heart muscle also contracts automatically and has a high cholesterol content, but in this case the high cholesterol is balanced by a correspondingly high phospholipid content, so that the ratio remains high. Since nervous tissue is present in muscle and contains both phospholipid and cholesterol, it would be desirable to know the extent of its contribution to the phospholipid and cholesterol of the muscle. Up to the present, no means for such a study has been available. There may be some significance in the fact that in smooth muscle, which is spontaneously active, there is nearly the same phospholipid/cholesterol ratio as in brain.

It may be noted here that creatine phosphorus (phosphocreatine) and lipid phosphorus (phospholipid) appear to be in inverse relationship in heart and skeletal muscle. Creatine phosphorus in heart is about 6 mg per hundred grams with lipid phosphorus about 80 mg per hundred grams, while in skeletal muscle the creatine phosphorus is about 60 mg per hundred grams and the lipid phosphorus about 30 mg per hundred grams. As is well known, the phosphocreatine of heart muscle must be promptly renewed if the muscle is to continue active, while skeletal muscle can work for a relatively long time before its phosphocreatine is exhausted. A relation between the high phospholipid content of heart muscle and its low phosphocreatine seems likely, and it is a reasonable assumption that the phospholipid is a readily available source of energy for the renewal of the phosphocreatine and perhaps of supply of phosphorus for the compound.

#### FAT METABOLISM

An understanding of the way in which fat is dealt with in the body is necessary for determining its function in the animal economy. The animal body is about three-fourths water, and practically all reactions which go on in life take place in water solution or in the presence of water. Solubility or miscibility in water is a basic requirement for utilization. Fat and its main constituent, the fatty acids, are insoluble in water, and various devices are employed to make them useful in the watery environment.

The fat entering the organism as food is, like all other foods, first broken up into its constituent parts, the fatty acids and glycerol. This process, hydrolysis, is brought about by enzymes (lipases) supplied mainly in the pancreatic juice. The lipases are in water solution and, since water does not penetrate fat, the action can take place only at the surface of the fat particles. It would therefore be slow. The devices employed to bring the splitting time within the limits allowed for digestion (about four hours) are first to increase greatly the surface, which is done by emulsification. Emulsification is accomplished by the help of a small amount of soap formed by interaction of the alkali of the pancreatic secretion with free fatty acid always present in fat. The soap together with other emulsifying agents—phospholipid (present in the pancreatic juice and the bile) and the bile salts, rapidly break up the mass of fat into minute particles, greatly increasing the surface presented to lipase action. Splitting proceeds rapidly and is speeded up by the prompt removal of the split products by absorption. In the absorption the bile salts are especially useful. The exact mode of action of these substances is not known, but several factors enter and are important. First, they form water soluble, diffusible compounds with the fatty acids. Second, they are excellent wetting agents and penetrate easily into the complicated absorbing surface. They have an affinity both for fatty acids and the watery absorbing surfaces and in this way carry the water insoluble fatty acids into close contact with and eventually through the walls of the epithelial cells. The water soluble form necessary for the absorption of the fatty acids is thus provided by the bile salt combination. Another water soluble form of the fatty acid is the sodium salt called soap. The importance of soap in fat absorption has been a matter of dispute for many years and is now recognized as secondary. The reaction of the intestinal contents is generally slightly on the acid side of neutrality and, under these circumstances, soap if formed would soon be broken up again. It has been found that soap in any considerable concentration is irritating and destructive to the intestine. It is apparently useful in the first stages of fat metabolism, emulsion formation and hydrolysis, after which the bile salts become the major agent in absorption. During its stay in the epithelial cells the absorbed fatty acid is recombined into fat before being passed out of the cells into the collecting system, which in the case of the fats is the lymph. A number of factors appear to be involved in this resynthesis. Sinclair<sup>23</sup> showed by the use of fats of pronounced character, coconut and cod liver oils, that the phospholipids of the epithelium were involved, since the newly absorbed fatty acids were found in the epithelial phospholipids in amounts sufficient to indicate that most or all

23 Sinclair, R. G. The Role of the Phospholipids of the Intestinal Mucosa in Fat Absorption with Additional Data on the Phospholipids of the Liver and Smooth and Skeletal Muscle, *J. Biol. Chem.* 92: 117, 1929.

the absorbed fatty acids passed into the framework of the intestinal phospholipids. These therefore constitute a stage in the absorption process. The resynthesized fat appearing in the thoracic duct is generally not the same as the absorbed fat but differs from it in degree of unsaturation, melting point and mean molecular weight of the fatty acids. These differences seem to mean either that the degree of unsaturation is adjusted (up or down) in the epithelium or that there is a mixing of the absorbed fat with fat brought from nearby depots. There appears to be an attempt to adjust the melting point of the incoming fat to a point near to body temperature since high melting fat when fed appears in the chyle with a considerably lower melting point, and low melting fat has its melting point adjusted upward.<sup>24</sup> That there is a dilution of absorbed fat with body fat appears probable from recent work.<sup>25</sup> As to the fate of the absorbed fat, the belief has always been that it passes into the lymph system and enters the blood stream as fat via the thoracic duct. All efforts to demonstrate other paths of absorption e. g. the blood stream via the portal system, have so far been unsuccessful. On the other hand, it has never been demonstrated that all the absorbed fat passes into the blood by way of the thoracic duct, in fact, recent attempts to recover absorbed fat from the thoracic duct have given remarkably small returns.<sup>25</sup> As noted earlier in the discussion, fat is believed to be hydrolyzed and then absorbed as fatty acid and glycerol but the possibility of absorption in the unhydrolyzed state has never been entirely eliminated. Furthermore, the manner of passage of the resynthesized fat out of the epithelial cells and into the lacteals of the villi is not known nor is the method of passage out of the blood into the storage and tissue cells any better understood. The best explanation of the latter two processes, and of the absorption of unsplit fat if any is absorbed, is that the fat passes the cell membrane by solution in it, as in the case of water soluble molecules, the phospholipid of the membrane aiding in the process.

A considerable portion of the absorbed fat appears promptly in the liver, which is for fat, as it is for other foods, a place of temporary storage for excess food which would otherwise flood the organism and probably be wasted either by unnecessary combustion or by excretion. Of the fat thus mobilized to the liver a considerable portion, perhaps all of it, is changed to phospholipid and then probably a large percentage is discharged into the blood and distributed to other tissues. The change of fat to phospholipid in the liver appears to be a necessary step for its later use. If formation of phospholipid is prevented there is an accumulation of fat, which in extreme instances may amount to half the liver weight and which eventually leads to death as the result of interference with normal liver function. The main cause of the fat accumulation has been shown to be a lack of the base choline, a necessary constituent of lecithin, since the fatty liver may be prevented and cured by the administration of choline. When choline or its "makings" are lacking, lecithin cannot be formed and the fat accumulates. The story is not quite as simple as that because of the involvement of other factors. For example, there is always some cholesterol ester present in the accumulated fat, and the amount is larger when there is much

cholesterol in the diet. The formation of cholesterol esters with the fatty acids and their storage appears to be one of the means used by the organism for disposing of excess cholesterol as well as excess of certain fatty acids, especially the more highly unsaturated ones.<sup>26</sup> The accumulation of cholesterol esters is always more difficult to clear out of the liver than the fat. Instead of choline, substances which supply the material for making choline are effective in curing the fatty liver. Certain proteins, casein among them, are effective and the constituent of casein mainly responsible has been shown to be the amino acid methionine, of which the methyl group is the important part (there being three methyl groups in choline).

The fate of the phospholipid formed in the liver and hence the fate of the fat from which it was formed is not known. The use of tracer substances has not given clear answers, since their use has shown, along with pertinent facts, that constituents of living tissues are in a continuous state of flux. In the proteins, whole sections, single amino acids or parts of amino acids may be taken out and replaced by new ones without the chemical composition of the protein being appreciably changed.<sup>27</sup> Similarly, in the case of the phospholipids the phosphorus and the fatty acids have been shown to be replaceable by similar substances in the food. Probably choline and glycerin are also replaceable, so that the finding of a phospholipid in muscle which has the same labeled fatty acid or phosphorus which was found earlier in the liver need not mean that the liver phospholipid has been transferred to the muscle, although it may have been.

A second function of the liver in fatty acid metabolism which has been recently shown to be important and perhaps essential is its ability to break the long carbon chains of the fatty acids into four carbon fragments which appear sometimes as acetoacetic acid ( $\text{CH}_3\text{COCH}_2\text{COOH}$ ), sometimes as beta-hydroxybutyric acid ( $\text{CH}_3\text{CHOHCH}_2\text{COOH}$ ) and sometimes as acetone ( $\text{CH}_3\text{COCH}_3$ ). These substances, known as acetone bodies or ketone bodies, have been known for a long time but have been regarded as dangerous by-products in fatty acid metabolism, dangerous because they are fairly strong acids and use up significant amounts of the metallic bases of the body for their neutralization and excretion. They appear in the blood and urine of human beings and some other animals when a large proportion of the energy is supplied by fat as in starvation or in untreated diabetes mellitus. They were considered to be the partially oxidized last four carbon atoms in the fatty acid chain, which were what was left after successive  $\beta$  oxidation and which for some unexplained reason were unoxidizable unless carbohydrate was being burned at the same time ("fats can burn only in the fire of the carbohydrates"). Work in the last ten years (summarized by Stadie and his associates<sup>27</sup>) has shown (a) that these substances are normally formed from fat in large amounts by the liver and to a considerable extent by the kidney, more than ten times the amount which appears in the urine, (b) that they are burned by muscle and other tissues, which however cannot form them, and (c) that they may supply most of the energy needed by the heart and presumably other tissues. The demonstration that these ketone acids can be formed and used by normal tissues in amounts large enough to

account for the total amount of fat metabolized puts an entirely new face on their importance and use in the organism, raising them from the status of harmful and occasional accidents to that of regular stages in fatty acid breakdown.

In many ways these substances are analogous to lactic acid which appears in carbohydrate breakdown. They appear in excess in blood and urine whenever unusual pressure is put on the organism to burn fat, just as lactic acid appears in excessive amounts in blood, urine and sweat when unusual pressure is put on the carbohydrate burning mechanism, as in heavy muscular work. They are relatively strong acids, call for neutralization to about the same extent, and have the same or only slightly greater potential menace to the state of neutrality in the organism as lactic acid. In their formation from fatty acids there is considerable energy loss just as there is in the change from glycogen or *d*-glucose to lactic acid. The loss is probably much greater in the case of the ketone acids because it is due to oxidation while the diminished energy value of lactic acid is due to internal rearrangement in the breaking of the glucose molecule. The liberation of energy in the change from glycogen to lactic acid is put to good use in bringing about the recovery of the contraction mechanism of the muscle. No consideration has as yet been given to the much greater liberation of energy in the change from a  $C_{16}$  fatty acid to four 4 carbon ketone acids, but there is little doubt that it could be and probably is put to similar uses. In the changes involved in the formation of lactic acid from glycogen or *d*-glucose phosphoric acid figures largely. The participation of phosphoric acid in the metabolism of the fatty acids has not been demonstrated beyond the first stage, that of phospholipid formation from fat, but it seems probable that much if not all of the metabolized fat does go through the phospholipid stage. As has already been noted, not much is known about the fate of the phospholipid formed in the liver, but since the ketone body acids are also formed there the obvious next step would be the formation of ketone acids from the fatty acids of the phospholipid and, if the analogy with lactic acid holds, they are formed by way of intermediate phosphorylated compounds. Nothing has yet been done to elucidate these later stages of fatty acid metabolism.

#### NUTRITIONAL VALUE OF FATS

Very little need be said about the relative nutritional value of fats and hence of availability and distribution for the reason that most of the ordinary food fats of both plant and animal origin consist mainly of the same few fatty acids—oleic, palmitic and stearic—in varying proportions, and it is to be expected that they would not differ much in digestibility or in metabolic usefulness. This is found in general to be the fact.<sup>28</sup> When the melting point is high digestion is slower and there is a tendency for unabsorbed fat to appear in the feces. The rate of absorption of various fats was found by one group of investigators<sup>29</sup> to be in the following order: linseed (best), then olive, whale, soybean, peanut, lard (rancid), cottonseed, cocoa butter, coconut and palm, but all were well utilized. Fats with a melting point above 37.8 C. were slowly absorbed. Laxative effects were noticed in only two

fats of a series of sixty-three fats fed at a 50-115 Gm level to human subjects. These were cocoa butter and goose fat.<sup>28</sup> At 140 Gm a day, beef fat was laxative. Hydrogenated oils, as long as the melting point remains below 37.8 C., are as well absorbed as the natural oils.

Natural fats carry in solution a number of non-fat substances some of which, for example, the fat soluble vitamins, are useful and desirable but have little importance in the metabolism of fat as such. Other fat soluble substances such as the sterols may in some cases be useful, as for example cholesterol in animal fats, while the sterols of plant fats are not useful because they are not absorbed by animals. This fact is made use of in treating certain individuals who have difficulty in excreting cholesterol, a shift from an animal to a plant diet stopping the cholesterol inflow.

Milk fat or butter contains, in addition to the common fatty acids, oleic, palmitic and stearic, considerable amounts of short chain fatty acids from butyric ( $C_4$ ) up to  $C_8$  which are presumably especially useful to the young animal. Milk fat contains also small amounts of cholesterol and phospholipid and varying amounts of the fat soluble vitamins or their mother substances. Egg fat is especially rich in phospholipid, cholesterol and vitamins. The fatty acids in both milk fat and egg fat are not especially notable since they originate largely from the food of the mother.

Aside from those well known dietary factors or vitamins which are essential for the general well-being of the living organism, two others have been found to be essential for the proper carrying on of fat metabolism. These are choline, the lack of which causes fatty livers and eventually death through liver failure, and certain "essential" fatty acids the nature of which is not entirely established. One, and perhaps the main one of these is arachidonic acid, although linoleic and linolenic acids are effective in curing the fat deficiency disease.<sup>30</sup> They appear to do so by transformation into arachidonic acid.

Since choline or its "makings" are essential for the necessary phospholipid stage in fat metabolism, materials for its synthesis must be supplied by the food. Choline itself is found in foods containing lecithin or sphingomyelin, such as brain, egg yolk, glandular products, meat, especially heart muscle and to a less extent in other animal foods. It may be synthesized by the organism. In its construction the methyl groups appear to be the critical constituents and there are not many sources of these. The most important one is the amino acid methionine, methyl homocystein or  $\alpha$ -amino methylthiol-n-butyric acid, which readily yields its methyl group in a variety of reactions in the animal body.<sup>30</sup> Methionine is supplied in food proteins, and of these casein has been found to be a satisfactory source. Undoubtedly other "good" proteins or mixtures of proteins would provide an adequate supply of methionine.

The essential fatty acids, especially linoleic, are widely distributed in both plant and animal fats and are found also in combination in starches, so that their supply in adequate amounts needs no special consideration. These acids are low in amount or absent in certain tropical seed fats, as for example coconut oil, which is used in making oleomargarine, and this fact has been urged as an objection to the use of oleomargarine instead of butter. However, commercial oleomargarine generally contains a considerable proportion of a

<sup>28</sup> Langworthy, C. F. The Digestibility of Fats. *J. Indust. & Engin. Chem.* 15: 276 (March) 1923. Holmes, A. D. Digestibility of Fats Taken from Different Parts of the Animal Body. *J. Oil & Fat Ind.* 3: 11 (Jan.) 1926.

fat or even butter and most diets contain enough other sources of these acids to make up for any deficiency. On the other hand marine animal fats contain large amounts of the essential fatty acids.

As sources of the essential fatty acids may be listed brain organs and tissues of animals which are not deficient in these acids and several natural fats generally with a high iodine number (degree of unsaturation) such as cod liver oil, corn and cotton oil, butter and egg yolk (provided the source animals are not fat deficient). Linseed oil is rich in the necessary acids but is unpalatable unless specially treated. In fact most of the natural oils (liquid fats) will yield enough of the required essentials if taken in ordinary amounts.

## Council on Pharmacy and Chemistry

### NEW AND NONOFFICIAL REMEDIES

THE FOLLOWING ADDITIONAL ARTICLES HAVE BEEN ACCEPTED AS COFORMING TO THE RULES OF THE COUNCIL ON PHARMACY AND CHEMISTRY OF THE AMERICAN MEDICAL ASSOCIATION FOR ADJUNCTION TO NEW AND NONOFFICIAL REMEDIES. A COPY OF THE RULES ON WHICH THE COUNCIL BASES ITS ACTION WILL BE SENT ON APPLICATION.

ALBERT E. SMITH, M.D., Acting Secretary

**DIGITALINE NATIVELLE**—Digitaline Cristallisee (Nativelle)—A glucosidal substance derived from the dried leaves of *Digitalis purpurea*, first prepared by Nativelle (*J. Pharm. Chem.* 9 225, 1869). The empiric formula of digitaline Nativelle closely approximates  $C_{44}H_{64}O_{17}$ . It is standardized by the intravenous cat method of Hatcher and Brody. 0.42 mg. equals 1 cat unit but the therapeutic dose is much less than that of digitalis in terms of cat units.

**Actions and Uses**—The action of digitaline Nativelle is like that of digitalis but its cardiac action is more persistent than that of digitalis.

**Dosage**—The full therapeutic effects are induced in a patient who has not had digitalis during the previous three weeks by the oral administration of a total of from 1.25 to 1.5 mg. of digitaline Nativelle given in fractional doses. This is the therapeutic equivalent of from 13 to 16 Gm. (20 to 25 grains) of digitalis. The total dose is given in fractions of from 0.25 to 0.5 mg., at intervals of from four to six hours. The total daily maintenance dose is from 0.1 to 0.2 mg. Patients may be digitalized by starting with total daily doses of 0.2 mg., such doses usually induce the full therapeutic effects in about one week. The great potency of digitaline Nativelle requires a careful observance of the proper technique of its administration.

Poisoning with digitaline Nativelle requires no treatment except the utmost quiet in bed, with a sedative, such as phenobarbital if necessary to secure rest. The stomach should not be washed unless there is reason to believe that it contains some of the poison but severe and repeated vomiting is a prominent symptom of poisoning with all digitalis bodies.

#### Tests and Standards—

Digitaline Nativelle appears as thin colorless odorless elongated rectangular platelike crystals possessing a bitter taste. It is practically insoluble in water, ether and glycerin, soluble in acetone, chloroform, ethyl alcohol and pyridine. Digitaline Nativelle may sinter at 230°C. and melts finally at from 253 to 263°C.

Digitaline Nativelle dissolves in cold concentrated hydrochloric acid to form a colorless solution but if this solution is heated on a water bath a green color should be obtained.

Dissolve a crystal of digitaline Nativelle in 2 cc. of glacial acetic acid containing a trace of ferric chloride and layer the solution on 2 cc. of concentrated sulfuric acid. A brown color should be produced at the zone of contact of the two liquids. This color gradually changes to green and finally to indigo blue. After half an hour the entire acetic acid layer will become blue.

#### E. FOUGERA AND COMPANY

Digitaline Nativelle (crystals) bulk

Tablets Digitaline Nativelle 0.1 mg. and 0.2 mg.

Solution Digitaline Nativelle, 1:1,000. 10 cc. glass stoppered bottles. Each 1 cc. contains 1 mg. of Digitaline Nativelle in a mixture of alcohol and glycerin.

**THIAMINE HYDROCHLORIDE** (See New and Non-official Remedies, 1941, p. 551)

The following dosage forms have been accepted

NATIONAL DRUG CO., PHILADELPHIA

Tablets Thiamine Hydrochloride 0.1 mg., 1 mg., 3.3 mg. and 6 mg.

Ampuls Solution Thiamine Hydrochloride, 3.3 mg. per cc. 1 cc. and 10 cc.

Ampuls Solution Thiamine Hydrochloride, 10 mg. per cc. 1 cc. and 10 cc.

Solution Thiamine Hydrochloride, 25 mg. per cc. 5 cc. ampul vials.

Solution Thiamine Hydrochloride, 50 mg. per cc. 5 cc. ampul vials.

Solution Thiamine Hydrochloride, 100 mg. per cc. 5 cc. ampul vials.

**DIPHTHERIA TOXOID, ALUM PRECIPITATED (REFINED)** (See New and Nonofficial Remedies, 1941, p. 464)

The following dosage forms have been accepted

NATIONAL DRUG CO., PHILADELPHIA

Refined Diphtheria Toxoid (Alum Precipitated) Marketed in packages of one 10 cc. ampul-vial representing five immunizations. For the two dose immunization treatment it is marketed in packages of one 2 cc. ampul-vial and two 10 cc. ampul-vials representing respectively one and ten immunizations. Contains merthiolate 1:10,000 as a preservative.

**ASCORBIC ACID** (See New and Nonofficial Remedies, 1941, p. 557)

The following dosage forms have been accepted

PARKE, DAVIS & CO., DETROIT

Tablets Ascorbic Acid 100 mg.

Glaseptic Ampoules Solution of Ascorbic Acid 2 cc. Each cubic centimeter contains 50 mg. of ascorbic acid and 0.1 per cent of sodium bisulfite added as a preservative.

**SOLUBLE PENTOBARBITAL** (See New and Non-official Remedies, 1941, p. 136)

The following dosage forms have been accepted

FLINT, EATON & COMPANY, DECATUR, ILL.

Capsules Pentobarbital Sodium 0.032 Gm. ( $\frac{1}{2}$  grain), 0.046 Gm. ( $\frac{3}{4}$  grain), 0.065 Gm. (1 grain), and 0.1 Gm. ( $1\frac{1}{2}$  grains).

**MENADIONE** (See THE JOURNAL, Jan. 17, 1941, p. 226)

The following dosage form has been accepted

S. M. A. CORPORATION, CHICAGO

Tablets Menadione 1 mg.

**RIBOFLAVIN** (See New and Nonofficial Remedies, 1941, p. 553)

The following additional dosage form has been accepted

GEORGE A. BREON & CO., INC., KANSAS CITY, MO.

Tablets Riboflavin 5 mg.

**LIVER AND STOMACH PREPARATIONS** (See New and Nonofficial Remedies, 1941, p. 328)

The following dosage form of Extract of Liver U. S. P. has been accepted

ARMOUR LABORATORIES, CHICAGO

Capsules Liver Extract Concentrate 0.5 Gm. in 0.37 Gm. of corn oil. A suspension of extract of liver U. S. P. in corn oil marketed in capsules. Each capsule (0.5 Gm. of extract of liver) represents a potency of  $\frac{1}{10}$  U. S. P. oral unit.

**NICOTINIC ACID AMIDE** (See New and Nonofficial Remedies, 1941, p. 556)

The following product has been accepted

MERCK & CO., INC., RAHWAY, N. J.

Nicotinamide (powder)  $\frac{1}{8}$  ounce, 1 ounce,  $\frac{1}{4}$  pound and 1 pound bottles.

## THE SUPPLY OF PHYSICIANS

As has been indicated previously in *THE JOURNAL*, many of the states have already given to the armed forces almost every physician that can be spared now. Some of the larger states must supply the personnel necessary for the immediate demands. Elsewhere in this issue (p 1029) is notation of the establishment in several states of additional recruiting boards which are designed to aid the work of the Procurement and Assignment Service for Physicians, Dentists and Veterinarians.

The letter circulated by the Procurement and Assignment Service has brought to the headquarters of that organization great numbers of return postal cards which indicate that many physicians have volunteered and are volunteering in response to the latest appeal. Nevertheless there is a distinct disparity between the applications coming through various routes directly to the Office of the Surgeon General of the Army, to the Air Force and to the Navy and the number that ought to be immediately available. Certainly the situation is not satisfactory when the armed forces are without a reserve pool from which to draw for an emergency. Everything possible is being done that can be done to hasten action on the applications of physicians through recruiting boards or directly through the Offices of the Surgeon Generals. The drive must continue, however, until some thousands of doctors have been commissioned who will be available for any contingency that may arise.

Again and again *THE JOURNAL* has pointed out that the needs of the armed forces will require that every physician under 45 years of age and physically fit who has not been stated by his state board of procurement and assignment to be engaged in an essential occupation must be made available to the armed forces. The Selective Service Act makes available to the armed forces every male citizen in the United States under 45 years of age. The physician who waits for the draft to pick him up certainly is in an unenviable light before his profession but even more in his own self respect. Little is to be gained by hesitating or holding back until

the call comes, as it eventually will have to come from the boards of the Selective Service if the needs of the armed forces are not satisfied.

The Procurement and Assignment Service for Physicians, Dentists and Veterinarians was developed to aid the medical profession in determining for itself equitable distribution of medical service during the emergency. By utilizing its facilities, hospitals are being enabled to retain essential members of their staffs, industries are being enabled to retain necessary physicians and medical schools are being enabled to hold a sufficient number of their faculties to continue medical education. Everything possible is being done to enable individual communities to retain enough physicians to provide needed medical services for the civilian population. If, however, the armed forces do not get the medical personnel that they require the civilian population might be compelled to yield physicians who are doing their utmost to maintain civilian health. Let us realize that the winning of this war is the most important single objective ever placed before the medical profession of these United States and give to our nation the same complete, wholehearted, voluntary service on which the nation has learned to depend in the past.

## TOXICITY OF MERCURIAL DIURETICS

Recently a communication<sup>1</sup> was published in *THE JOURNAL* attributing the sudden death of 3 patients with congestive heart failure to the intravenous injection of a mercurial diuretic. The publication of this statement stimulated a review of the toxic manifestations and the fatalities that have been reported in connection with these widely used agents. In this issue of *THE JOURNAL* appear four reports.<sup>2</sup> The completeness with which consideration is given to various phases of the problem lends to this group of papers the aspect of a symposium. They should focus the attention of the medical profession on the need for care in the use of mercurial diuretics.

While the frequency of fatal accidents due to the mercurial itself is probably higher than has been supposed, the mortality attributable to the mercurial diuretics by any mechanism does not appear to be greater than is indeed as great as, that reported for certain other potent drugs which are employed with equal frequency. The mechanism of sudden death in the small proportion of patients in whom the cause could be ascribed to the drug alone is explained by experimental studies on animals.

Barker, M. H., *Lindberg, H. A., et al., Sudden Death and Mercurial Diuretic*, p. 1011.  
A. C. and Lehman, R. A., *The Acute Toxicity of Mercurial Diuretics*, p. 998.

either a primary poisoning effect of the mercury on the heart (ventricular fibrillation) or as respiratory failure secondary to the impaired cardiac action which is presumed to lead to anoxia through lowering of the blood pressure. However, in the majority of deaths reported following the use of mercurial diuretics the blame could be placed on the moribund condition of the patient, on digitalis poisoning due to mobilization of that drug in the blood stream from the edematous fluid removed by action of the mercurial, on the depletion of chloride resulting from previous diuresis, leading to oliguria or anuria and to faulty elimination of the diuretic itself or on the presence of kidney impairment sufficient to prevent adequate excretion of the drug or to predispose to such damage by the mercurial. The largest proportion of the fatalities occurred among patients with evident kidney disease in which the use of mercurial diuretics is generally considered to be contraindicated. The comparatively rare idiosyncrasy to mercury compounds has been reported as a cause of death but apparently occurs with no greater frequency than with other drugs in susceptible patients. In the reports appearing elsewhere in this issue of THE JOURNAL it is suggested that the cutaneous eruptions produced by mercurial diuretics are now probably on an allergic basis rather than on the basis of a true mercurial dermatitis, since the latter is said to be no longer observed with the use of the more rapidly excreted theophylline containing mercurials on the market. Emphasis is placed on minor reactions, as well as the rare one suggestive of anaphylactic shock, as they may constitute a warning of more serious reactions if the mercurial agent is not discontinued.

The observations reported also indicate that change in the route of administration may not prevent the danger of accidents. The lack of deaths following the intramuscular or rectal administration of the mercurial may be due to the fact that the intravenous route is by far the one most commonly employed. Studies in animals of the comparative lethal doses of the commonly employed organic mercurial diuretics given at various intervals suggest that the sudden deaths reported in man probably cannot be avoided by slower injection or by dilution of the drug, nor can they be accounted for by the theophylline component or the concomitant administration of other drugs used in heart disease. The clinical observers further suggest that the striking wasting of the body of the edematous patient may account for the deaths on the basis of a relative overdose of mercury although the animal experiments indicate that the size of the dose administered cannot be evaluated as a factor unless death occurs within the same time interval.

The deaths reported should serve to emphasize to the physician the importance of observing the known

precautions in the use of these drugs. The investigators have made a praiseworthy attempt to bring these facts to the attention of the medical profession. As indicated in one of the reports, a possible method of treatment for the cardiac irregularities sometimes induced by the mercurial diuretics is under consideration. Further investigations may conceivably provide a means of eliminating even the danger of fatalities which cannot be avoided by the observance of known contraindications to the use of mercurial diuretics. The reported fatalities and toxic reactions should not discourage the rational use of mercurial diuretics. They should, however, serve as a warning and explanation of what to expect in rare instances or following promiscuous use of such agents.

#### THIAMINE IN THE AMERICAN DIET

In a recent contribution on the thiamine content of the American diet, Williams and his co-workers<sup>1</sup> state that their plan involved an attempt "to formulate a sequence of diets which contain all of the more important foodstuffs of the American dietary in proportions corresponding to the annual per capita consumption of each." Significance is given the conclusions through the use, as the principal basis of computation, of the extensive data of Stiebeling and Phipard<sup>2</sup> on diets of families of employed wage earners and clerical workers in cities. The assay was carried out by a modern chemical method supplemented, when indicated, by animal tests. With a daily intake of 2,500 calories as a basis for computation, the comparative contribution of the various food groups to the energy intake and to the total thiamine consumption is given.

The cereal products account for 47 per cent of the total daily calories and, when the white bread was not fortified with added vitamin, for 24 per cent of the thiamine. The dairy products, providing 18 per cent of the energy, give 21 per cent of the thiamine. Meat, which accounts for 15 per cent of the calories, is responsible for over 26 per cent of the thiamine, and of this total pork provides almost 22 per cent alone. The energy yielded by the vegetables is only 8.8 per cent, but the proportion of the total vitamin B<sub>1</sub> is high, namely 21.5 per cent. The fruits provide 4 per cent of the calories and 9 per cent of the thiamine. Corresponding to the total daily energy intake of 2,500 calories is a total vitamin B<sub>1</sub> intake of about 0.8 milligram.

The Food and Nutrition Board of the National Research Council has given 1.8 mg of thiamine as the daily requirement of the adult. The data of Williams

<sup>1</sup> Lane R. L., John O., Elizabeth and William R. R. J. Nutrition 23: 613 (June) 1942.

<sup>2</sup> Stiebeling H. K. and Phipard E. F. Circular 507 U. S. Dept. Agr. 1939.

and his co-workers indicate that the thiamine content of the average diet, such as was consumed by the middle two thirds or three fourths of the American people prior to the advent of enriched bread, would be considered inadequate at present. If enriched bread replaced the white bread in the diet under consideration, the vitamin B<sub>1</sub> would be raised to an intake of 1.3 milligrams a day, a value approaching a satisfactory level.

The foregoing discussion emphasizes the importance of bread, milk and meat as sources of thiamine in the average American diet. It adds support to various earlier contentions that our national diet is likely to be inadequate in this respect and demonstrates the possibility of bringing the intake of vitamin B<sub>1</sub> into the adequate range through the use of enriched flour.

## Current Comment

### USE OF SACCHARIN FOR SWEETENING

Sugar rationing and new emphasis on weight reduction have doubtless increased the use of saccharin for sweetening purposes. Renewed interest in the possible harmful effect of this substance is an apparent corollary. Earlier investigations of saccharin, however, have failed to reveal dangerous side-actions except from extremely large doses. Likewise the evidence does not reveal any reason why saccharin cannot be used continuously in average sweetening doses for an indefinite period. Many patients have taken saccharin for years without harmful effect.<sup>1</sup>

### DEATH RATE CONTINUES TO DECLINE

Provisional mortality rates issued on July 3 by the Bureau of Census show that there was an actual decline in the number of deaths in the United States in 1941 as compared with the previous year, in spite of an increase in population. The total deaths in 1941 were 1,395,907, which is 21,362 less than the number reported for the registration area in 1940. Since 1933 all states have been included in the registration area, which lends a completeness to these figures that makes them more significant. Although it was generally true, with some important exceptions, that the states included latest were those with higher mortality, which tends to give an unfavorable bias to long time trends based on the registration area, this report shows that the death rate in the states included in this area has declined from 17.2 per thousand of population in 1900 to 10.5 in 1941. The highest death rate, 12.8, in 1941, was in cities of between 10,000 and 100,000 population. In cities of over 100,000 it was 11.7 and in rural districts 9.2. Death rates of less than 9 per thousand were found in Arkansas, North Dakota, South Dakota, Utah, Idaho, Oklahoma, Wyoming and North Carolina. The census

report says of these rates "The differences in crude death rates between states do not necessarily indicate corresponding differences in health conditions. The age, sex and racial composition of the population differ between states, and these factors, among others, affect the crude death rate."

### FIRST AID INSTRUCTORS ASSOCIATION

The members of a class for first aid instructors conducted by the U. S. Bureau of Mines at McPherson, Kan., in 1938 established an organization to promote first aid instruction in the petroleum industry. This organization has now grown into the Munsch National First Aid Instructors Association with chapters in Kansas, Oklahoma, Texas, New Mexico and Arkansas. Additional objects of the organization include the achievement of safety in the petroleum and allied industries, promotion of cooperation among employees and other organizations with similar objectives and dissemination of instruction on first aid and safety. The Bureau of Mines was not able to hold first aid classes among all or even a small percentage of employees in these widely scattered, small plants. The Munsch First Aid Instructors Association has trained six thousand, two hundred and forty employees for three hundred and forty-one companies, which far exceeds the number that the Bureau of Mines can reach under any other plan with the same number of instructors. The association has a national council, which is the governing body, state councils and district chapters. There are no dues. Each member aims to teach a first aid class each year. He organizes his own class regardless of company affiliations. Any person may become a member of the district chapter organization who has a U. S. Bureau of Mines first aid instructors card. The national association has adopted a constitution, insignia, lapel pins and merit bars, and awards in the form of bars have been planned by the national council. The esprit de corps among the members is high. The association has been valuable to its members, to the Bureau of Mines and to the many small oil companies. In some communities the chapters enter into civic and school activities, cooperate with the police in accident prevention programs, and make safety talks in schools and clubs. The members of one chapter built an emergency trail, equipped with first aid supplies and have conducted radio programs in their community in first aid and accident prevention. The instructors have carried out this training without remuneration, and those attending the classes do so at their own expense. Thus the work of the Munsch National First Aid Instructors Association must be limited. The association hopes, however, that the value of its work will be recognized and that donations of funds will be made to the national council. The U. S. Director of Civilian Defense has urged communities to spread knowledge of first aid as far as possible among the people. Last year the American Red Cross had more than thirty-five thousand first aid instructors throughout the country and during the year instructed a million persons in first aid.

<sup>1</sup> Wilcox, R. W. The Therapeutics of Benzodisulphimide, M. Rec. 98:595 (Oct. 9) 1920.

# MEDICINE AND THE WAR

*In this section of The Journal each week will appear official notices by the Committee on Medical Preparedness of the American Medical Association, announcements by the Surgeon Generals of the Army, Navy and Public Health Service, and other governmental agencies dealing with medicine and the war, and such other information and announcements as will be useful to the medical profession*

## STATE HOSPITAL OFFICERS APPOINTED

The Medical Division of the Office of Civilian Defense announces the appointment of state hospital officers in coastal states to direct the hospital program of the Emergency Medical Service under the state chiefs of Emergency Medical Service. The following have received full time civil service appointments in the U S Public Health Service for these positions:

California Mr. Thomas I. Clark, executive secretary, California Hospital Association, San Francisco  
Connecticut Mr. William O. Sweeney, administrator, Windham Community Memorial Hospital, Willimantic  
Massachusetts Mr. Oliver Pratt, administrator, Salem Hospital, Salem  
Pennsylvania Major Roger A. Greene, administrator, Pottsville Hospital, Pottsville  
Virginia Mr. M. Haskins Coleman, secretary, Richmond Hospital Service Association, Richmond  
Fourth Civilian Defense Region Mr. John W. Rankin, Durham, North Carolina

The following hospital officers have been appointed consultants in the Public Health Service for part time duty:

Maine Mr. C. K. Lermond, Thomaston  
Maryland and District of Columbia Mr. J. Douglas Colman, executive director, Associated Hospital Service of Baltimore  
New Hampshire Mr. Donald Steele Smith, administrator, Mary Hitchcock Memorial Hospital, Hanover  
New Jersey Dr. Emil O. Frankel, division of statistics and research, State Department of Institutions and Agencies, Trenton  
Oregon Mr. Ralf Couch, chairman, Hospital Service Council, Portland  
Rhode Island Dr. George Matteson, Providence, general surgeon  
Vermont Mr. Laurence Campbell Barre, hospital trustee and a trustee of the New England Hospital Assembly

The duties of these hospital officers will be to survey rural hospital facilities suitable for use as emergency base hospitals, to supervise personnel arrangements for the base hospitals and reception centers for evacuated civilians, to collaborate with state chiefs of the Emergency Medical Service in controlling movements of medical and nursing staffs as well as of casualties in any situation affecting emergency base hospitals and to perfect arrangements for transporting patients evacuated from casualty receiving hospitals.

## RECRUITING BOARDS—SULFANILAMIDE—STUDIES OF WORLD AREAS

War Secretary Stimson told his press conference that every American soldier going into a theater of operations will be provided with a package of 5 Gm. of crystalline sulfanilamide to sprinkle on wounds in addition to twelve sulfanilamide tablets for internal use. He said the Army is increasing the number of medical department officers' recruiting boards to supply the need for additional doctors. Two additional boards have been authorized in New York, Pennsylvania and California and one additional board in Massachusetts, Ohio and Illinois, while one board is functioning in each of the other states. A medical officer from the army air forces has been added to each of the twenty-nine recruiting boards to obtain doctors for the air service and a dental officer has been assigned to each board to assist in obtaining dentists. The recruiting boards may be located through local medical societies or the Surgeon General, Washington, D. C.

The Division of Medical Intelligence, Preventive Medicine Service, Office of the Surgeon General, has prepared a series of studies covering four general world areas on health, sanitation and climatic conditions. These instructions are being issued to military attaches and members of military missions, as well as to medical officers of overseas forces, to protect the health of U. S. soldiers sent to those regions. Subjects treated include water consumption safety precautions, protection against mosquitoes and other insects that carry disease, prevention of diseases indigenous to the various regions, bathing precautions, care

of the skin and feet, selection of suitable clothing, prevention of sunstroke, energy conservation and health maintenance under desert or tropical conditions, prevention of illness from food spoilage or contamination and many other hygienic precautions.

Secretary Stimson said that the Women's Army Auxiliary Corps now has two contract nurses and as the corps increases, female medical officers may be inducted into the corps or will be contracted at the rate of five for every thousand women.

## WIDESPREAD RESPONSE OF PHYSICIANS IN NEW YORK

A survey by the New York State Medical Society made public July 5 covering 98 per cent of the population of the state gave assurance that the medical needs of every community will be protected. The survey disclosed the number of doctors already in active military service and the number of others who have been commissioned and are awaiting orders. The process of obtaining this personnel and at the same time of protecting the local communities offers assurance that the needs of the government will be met. The survey was made by direction of the Council of the New York State Medical Society and was conducted by the Medical Preparedness Committee. The chairman, Dr. Louis H. Bauer, pointed out that the setup under which they are working is for local medical societies to determine who is and who is not essential. Physicians are not taken into the service until released by the community in which they live. The survey showed that a total of 6,000 have already been released by these county committees in addition to those now in active service.

## EMPLOYMENT OF HANDICAPPED WORKERS

Since the establishment of the War Manpower Commission in April, conferences have been held by the U. S. Office of Education, the U. S. Employment Service and the Division of Industrial Hygiene to consider the employment of physically handicapped persons in the war industries. Recommendations have been made to the War Manpower Commission, and a letter to employers calling for review and revision where necessary, of existing physical standards for employment, awaits the signature of the commissioner. The policy enunciated in this letter would require the employment of many thousands of persons with minor or major disabilities and would make the preemployment physical examination an effective tool for the proper placement of all workers.

## FILM STORY ABOUT NAVY PHYSICIAN

According to news reports from Hollywood (Brady Thomas F. New York Times, June 28) the life and recent experiences of Dr. Corydon M. Wassell, naval medical corps, will be used as the basis for a new moving picture. Dr. Wassell it will be recalled, was individually named for his heroic work in the battle of Java in a radio broadcast by President Roosevelt. The movie, it is said, will emphasize Dr. Wassell's work between February 4, the date of the action by the *Marblehead* and the *Houston* and March 13, when he and eight wounded men arrived in Australia on board the last small ship out of Java. It has been announced that the Navy Relief Society has already received a \$50,000 advance against an undisclosed percentage of the gross rentals of the picture.

**MORE NURSES' AIDES NEEDED**

As of June 20, 25,905 nurses' aides have been enrolled toward the goal of 100,000. The Office of Civilian Defense has asked its regional office representatives to work out plans for stimulating the recruitment of nurses' aides to meet war demands. A recent memorandum reveals that some hospitals are reported to be accepting volunteer workers without training and permitting them to carry out many of the tasks usually performed by nurses' aides. Such a practice, it was said, militates against the establishment of a reliable disciplined corps of workers and deters enrolment of nurses' aides.

Nurses' aides are recruited by the American Red Cross in cooperation with the local civilian defense volunteer offices. The training course includes eighty hours of instruction presented in seven weeks, the first half being given in the Red Cross headquarters and the other half in hospitals selected as training centers. Nurses' aides agree to give one hundred fifty hours of service in each calendar year, but, in case of need for war service, they must be prepared to serve locally in emergency for as long as needed. The goal of 100,000 trained nurses' aides must be reached. The medical division of the Office of Civilian Defense declared that in no other branch of service can women be of greater value to the war effort.

**STATE CIVILIAN DEFENSE MEDICAL OFFICIALS COMMISSIONED IN PUBLIC HEALTH SERVICE**

To facilitate the emergency program being developed by the Medical Division of the Office of Civilian Defense and the U S Public Health Service, physicians who are state and deputy state chiefs of Emergency Medical Service in most of the coastal states have been commissioned in the Public Health Service Reserve so that they may exercise both state and federal responsibilities. Where a state chief of Emergency Medical Service is unable to give full time to this activity, his commission is to remain on an inactive status and he is provided with a deputy commissioned in the active reserve who is called immediately to full time service. These officers will have as their first duty the stimulation and guidance of local chiefs of Emergency Medical Service in the organization of casualty receiving hospitals and field casualty services. They will serve also as responsible agents of the states and of the medical division of the Office of Civilian Defense and of the Public Health Service for the organization of emergency base hospitals. These officials will determine, in collaboration with the local military and the state evacuation authorities, the lines of evacuation and means of transport of civilian casualties and other hospitalized persons from local casualty receiving hospitals to emergency base hospitals. These officers also will review and certify bills to be submitted to the Public Health Service for payment for the hospital care of civilian casualties.

As of July 1, the following have been commissioned in the active reserve of the Public Health Service as state or deputy state chiefs of Emergency Medical Service to carry out this program:

Alabama Dr John Newdorp, Montgomery, deputy state chief  
California Dr Charles F Sebastian, Los Angeles, state chief  
Connecticut Dr Ralph E McDonnell, New Haven, deputy state chief  
Florida Dr Gilbert S Osmeup, Orlando, state chief  
Georgia Dr Edwin R Watson, Atlanta, deputy state chief  
Maryland Dr Arthur J Lomas, Baltimore, deputy state chief  
Massachusetts Dr Andre W Reggio, Chestnut Hill, deputy state chief  
New Jersey Dr Gerald W Sinnott, Jersey City, deputy state chief  
North Carolina Dr Sylvester D Crug, Winston Salem, deputy state chief  
Oregon Dr Vernon A Douglas, Salem, state chief  
South Carolina Dr H Grady Cullison, Columbia, deputy state chief  
Washington Dr Arthur E Lewis, Seattle, deputy state chief

In New York Dr Randolph A Wyman, Brooklyn, has been commissioned to serve as deputy city chief.

In certain cases state chiefs on part time duty have been appointed consultants in the Public Health Service. Thus far these include:

New Hampshire Dr Charles H Parsons, Concord  
Delaware Dr Meredith I Samuel, Wilmington  
Virginia Dr Edgar C Harper, Richmond

Mr Lee Mailler, New York, chairman of the State Health Preparedness Commission, under which the Emergency Medical Service of New York State has been developed, has been appointed a special consultant.

**MEDICAL RECRUITING BOARD**

In conjunction with the Office of Procurement and Assignment for the District of Columbia, a Medical Recruiting Board has been established at the headquarters of the District of Columbia Medical Society, 1718 M Street NW, Washington D C. The board consists of Lieut Col Willard C Goley M C, U S Army, and Major Wilham H Phillips of the infantry, representing the adjutant general. Dr Francis A McGovern is procurement and assignment officer for the District. Letters have been sent to four hundred physicians up to the age of 45 in the District who have been considered available for military service, requesting them to come to the medical society building for interviews concerning commissions in the Medical Corps of the Army. This method of recruiting of physicians has been resorted to in view of the immediate need of the armed forces for more medical officers.

**CONSULTANTS ON BLOOD AND PLASMA PROGRAM**

Under the program launched by the Medical Division of the Office of Civilian Defense and the U S Public Health Service to provide plasma for the treatment of civilians injured in warfare, regional consultants have been appointed to advise hospitals on technical problems related to the establishment of blood and plasma banks.

Dr Fred Bryan, Rochester, N Y, is the consultant for the first and second civilian defense regions and a part of the third region. Dr John Elliott, Salisbury, N C, will serve in the fourth and eighth regions and the remainder of the third. Dr Emeric Dobos, Senior Surgeon (R), U S Public Health Service, is on active duty in the ninth region. Dr Elmer L DeGowin, Iowa City, is acting as technical consultant on special problems. The blood and plasma bank program is at present confined to vulnerable areas within 300 miles of the ocean and gulf coasts. The Subcommittee on Blood Substitutes, Division of Medical Sciences, National Research Council, serves in an advisory capacity to the Medical Division of the Office of Civilian Defense, as it does to the medical departments of the Army and Navy and the American Red Cross.

**NEW YORK HOSPITAL UNIT**

The trustees of Cornell University and the governors of the Society of the New York Hospital gave a dinner, July 14, at the Hotel Roosevelt in New York City to the physicians and nurses who were inducted the following day as the staff of a general hospital of the U S Army. These physicians and nurses were from the staffs of the New York Hospital and Cornell University Medical College. The military hospital will bear the same number as the New York Hospital unit in the first world war. About two hundred persons attended the dinner. The speakers were Lieut Col Ralph F Bowers, director of the hospital unit, who was a member of the surgical staff of the New York Hospital, Langdon P Marvin, acting president of the Society of the New York Hospital, and Roger William, trustee of Cornell University, who said that New York Hospital has a long record of service to the wounded, its first patient having been soldiers of General Washington's army admitted July 12, 1776 after the bombardment of the battery in New York City. New York Hospital also cared for soldiers in the War of 1812, for soldiers in the Civil War and for a unit to Puerto Rico in the Spanish-American War.

**CHEMICAL WARFARE TRAINING CENTER**

The War Department has announced, according to the *and Navy Journal*, that a chemical warfare training center is to be established in the South on a 30,000 acre site. The accommodations will be for five thousand men, which may be increased if necessary. After completion of the center at the training center the men will be assigned to chemical warfare units throughout the Army.

**"GUIDES TO THERAPY FOR MEDICAL OFFICERS"**

A technical manual for medical officers has just been issued by the Government Printing Office in Washington, entitled "Guides to Therapy for Medical Officers." The material on which the text of the manual is based was furnished largely by the various committees and subcommittees of the Division of Medical Sciences of the National Research Council with the assistance of other consultants. A preliminary note gives the names of all the various specialists who cooperated in producing this book. The final editing was done by Dr. R. N. Nye of the Committee on Information of the Division of Medical Sciences of the National Research Council. The book is divided into seven sections covering a general consideration surgical emergencies medical emergencies diagnosis and treatment of venereal diseases chemotherapy and serotherapy in certain infectious diseases treatment and control of certain tropical diseases and the rickettsial diseases. Here in outline form is a compilation of the very latest information available on the subjects discussed as standardized for use under Army conditions. The book constitutes, therefore, an invaluable reference work for the Army medical officer and will be found most valuable by any physician under any circumstances. Copies of the book are available from the Superintendent of Documents Washington, D. C. The price is 25 cents.

**MASONS PRESENT AMBULANCES TO RED CROSS**

At a ceremony held, on account of inclement weather, in the New York City council chamber on June 27 the Masonic order of New York State presented eleven ambulances and a check for \$25,343 to the American Red Cross, which was accepted by its chairman Hon. Norman H. Davis. The mobile units were inspected by Mr. Davis, Major La Guardia and Masonic officers. In his speech Mr. Davis disclosed that negotiations were then pending for the operation of a 'mercy ship' in the Pacific Ocean to carry under the supervision of the International Red Cross Committee, food clothing and other needed articles to United States prisoners of war and civilians interned in Japan and elsewhere in the Far East. Mr. Davis said that some parcels had already been dispatched to the prisoners of war in Japan.

**GRADUATES IN AVIATION MEDICINE UNDER NEW SYSTEM OF TRAINING**

The course of instruction in aviation medicine for aviation medical examiners is now divided into two parts: the didactic portion being conducted at one field and the practical portion at three army air forces classification centers. The first class to graduate under this new system of training was graduated on July 2. Appropriate exercises were held in each of the centers. The list of graduates follows:

**ALABAMA**

John H. Lary, Captain Huntsville  
Reuben J. Maxwell, 1st Lieut. Sulligent

**ARKANSAS**

Byron Z. Binns, 1st Lieut. Monticello  
Coy C. Kaylor, 1st Lieut. Van Buren

**CALIFORNIA**

Donald C. Collins, Major Beverly Hills  
Hille O. Hall, 1st Lieut. Beverly Hills  
William F. Harding, Captain Sacramento  
John T. Klausner, Captain Los Angeles  
Francis B. O. Morris, 1st Lieut. Santa Barbara  
Albert D. Phillips, Major Sacramento

**COLORADO**

George A. Peabody, 1st Lieut. Denver  
Lerry G. Pratt, Captain Denver  
Charles E. Walker, Major Denver

**CONNECTICUT**

Harold I. Harvey, 1st Lieut. New Britain  
Gerald Krosnick, 1st Lieut. New Haven

**DELAWARE**

Joseph S. McDaniel, 1st Lieut. Dover

**DISTRICT OF COLUMBIA**

Nicholas F. Atria, Captain Washington  
L. Rander Braswell, Major Washington  
Robert S. Brua, Major Washington  
John M. Collins, Captain Washington  
Richard I. Crone, Captain Washington  
Donald H. Earl, Captain Washington  
Everett C. Freer, Captain Washington  
Wendell P. Harris, Captain Washington  
Aubrey L. Jennings, Major Washington  
Russell S. Leone, Major Washington

John J. Mearns, Captain Washington

Franklin I. Spruin, Captain Washington

**GEORGIA**

James W. Merritt Jr., 1st Lieut. Gainesville  
Fred E. Murphy, 1st Lieut. Jessup  
Glenn W. Pennington, 1st Lieut. Mathews

**ILLINOIS**

Donald W. Anderson, 1st Lieut. Chicago  
Leon J. Armalavage, 1st Lieut. Chicago  
Robert E. Bowen, 1st Lieut. Chicago  
Milton J. Loring, 1st Lieut. Chicago  
Robert J. Stephen, 1st Lieut. Joliet  
Anthony J. Sweeney, 1st Lieut. Chicago

**INDIANA**

Paul A. Clouse, 1st Lieut. Evansville  
John M. Palm, Captain Brazil

**IOWA**

Vance J. Elliott, Captain Knoxville  
Elmer M. Smith, Captain Granger

**LOUISIANA**

Chester S. Fresh, Major, New Orleans

**MASSACHUSETTS**

Arthur J. Hadler, 1st Lieut. Boston  
Jonathan I. Morrison, 1st Lieut. Newton

**MICHIGAN**

Cecil D. Conrad, 1st Lieut. Ypsilanti  
James E. Forsyth, 1st Lieut. Albion  
Roelof Lanting, 1st Lieut. Gladwin  
Alexander Vida, Captain Detroit

**MINNESOTA**

Kenneth E. Bray, Captain Brwabik  
William P. Gjerde, 1st Lieut. Staples

**MISSOURI**

Anthony V. Benincasa, 1st Lieut. St. Louis  
Williston P. Bunling, 1st Lieut. Kansas City  
Earl E. Miller, Captain Kansas City

**MONTANA**

Thaddeus F. Bush, 1st Lieut. Butte  
Raymond O. Lewis, 1st Lieut. Roundup

**NEBRASKA**

John H. Easley, Captain Lincoln  
Richard H. Schaefer, Captain Omaha

**NEW JERSEY**

Sam Lemkin, 1st Lieut. Newark  
William D. O'Gorman, Captain Jersey City

**NEW YORK**

Louis L. Amato, Captain New York  
Charles A. R. Connor, 1st Lieut. New York  
Alfred H. Dobrak, 1st Lieut. Buffalo  
Frederic Lewis, Captain New York  
Edmund F. Longworth, 1st Lieut. Pelham  
Hubert S. Senne, 1st Lieut. Glen Dale  
Charles S. Yavdow, 1st Lieut. Mount Vernon

**OHIO**

Edwin E. Ash, 1st Lieut. Forest  
Attilio D. Puppel, 1st Lieut. Ashley  
Herman M. Turk, Captain Euclid

**OREGON**

Max W. Hemingway, Captain Bend  
Herbert D. Lewis, Captain Hood River  
Richard W. Lyman, 1st Lieut. La Grande  
Charles P. McKim, 1st Lieut. Baker  
Weldon T. Ross, 1st Lieut. McMinnville

**PENNSYLVANIA**

Frank L. Bracken, 1st Lieut. Westmont  
Robert M. Laughlin, 1st Lieut. Pittsburgh  
Joseph W. Mendoza, Captain Harrisburg  
Paul H. Rankin, Captain Sharpsville  
Howard M. Seull, 1st Lieut. Langehorne  
George C. Wassell, Captain Pittsburgh

**SOUTH CAROLINA**

James E. Lipcomb, Captain Greenville

**SOUTH DAKOTA**

Lindeay J. Ervin, 1st Lieut. Montrose  
Ryland M. Jacobus, 1st Lieut. Letcher

**TENNESSEE**

Willard D. Bennett, 1st Lieut. Nashville  
Melvin M. Simmons, 1st Lieut. Nashville  
Jehu C. Walker, Captain Savannah

**TEXAS**

Sam H. Druden, Captain Abilene  
Earl K. Cill, Major Corpus Christi  
Carl F. Goeth, Captain San Antonio  
Samuel H. Haigler, 1st Lieut. Austin  
Haskell D. Hatfield, Major El Paso  
Benjamin B. Hutchinson, 1st Lieut. Lubbock  
Ulen G. Medford, 1st Lieut. Lufkin  
William C. Smith, 1st Lieut. Lockhart  
Afton N. Wilkins, Captain Conroe

**UTAH**

Clarence C. Hetzel, Captain Ogden  
Rulon F. Howe, 1st Lieut. Murray  
Vernal H. John, Captain Ogden

**VIRGINIA**

Charles P. Alexander, Captain Richmond

**WASHINGTON**

Louis D. Fox, Captain Seattle

**WISCONSIN**

Edward H. Loveroo, Captain Superior  
Mancel T. Mitchell, Captain Eau Claire  
Oscar C. Olson, Captain Madison  
Julius A. Roth, Captain LaCrosse

**WYOMING**

Paul F. Miner, 1st Lieut. Laramie.  
CUBA  
Roberto Covas y Coro, 1st Lieut. Havana  
Risley F. Haines, 1st Lieut. Bayamo

# ORGANIZATION SECTION

## MEDICAL LEGISLATION

### MEDICAL BILLS IN CONGRESS

**Changes in Status**—H R 7378, the Revenue Act of 1942, has been passed by the House of Representatives. The normal tax rate on individuals, it is proposed, will be 6 per cent instead of 4 per cent as under existing law. The surtax will start at 13 per cent instead of 6 per cent for the first \$2,000 surtax net income, with a constant increase in the rate for incomes in the higher brackets. The personal exemption for a single person will be \$500, for a married person \$1,200. Deductions for dependents will remain as in the existing law at \$400. A new provision authorizes an additional deduction for persons in the military or naval service by exempting from taxation so much of the amount received during the present war by an individual in the military or naval forces as salary or compensation in any form from the United States for active service in such forces as does not exceed \$250 in the case of a single person and \$300 in the case of a married person. The bill proposes no change in the earned income credit. No authorization is made for the deduction of expenses incurred for medical care as had been recommended by the Treasury Department, nor does the bill provide for the taxation of certain income of charitable and other exempt corporations, as had also been suggested by the Treasury Department. The bill does provide for relief in the manner of the treatment of income accruing on the death of a taxpayer. Heretofore, accounts receivable on the books of

the taxpayer at the time of his death have been accrued for income tax purposes for the year in which death occurred, resulting in inequitable burdens on the estates of the deceased taxpayers who had reported their incomes on a cash receipts and disbursements basis. The pending bill proposes that such accounts will be taxable as collected, the tax to be paid by the persons who actually receive the money. H R 7239 has passed the House, authorizing the Director of the Census to issue certifications of birth records.

**Bills Introduced**—S 2654, introduced by Senator Pepper, Florida, proposes to authorize the Federal Security Administrator to establish and maintain a system for recording the dates and places of birth of individuals within the United States. H R 7379, introduced by Representative Allen, Louisiana, proposes that the United States shall, in addition to hospitalization and medical care now authorized by law, provide vocational training for all disabled veterans at public expense. H R 7396, introduced by Representative Gearhart, California, provides for vocational rehabilitation and return to civil employment of disabled persons discharged from the military and naval forces. H R 7398, introduced by Representative Costello, California, proposes to authorize an appropriation not to exceed the sum of \$2,600,000 to construct a fireproof marine hospital for the accommodation of approximately 300 bed patients in or near Los Angeles.

## WOMAN'S AUXILIARY

### Colorado

The Woman's Auxiliary to the Boulder County Medical Society, which was organized in 1940, now has a paid membership of thirty. The members are from Boulder, Longmont, Louisville and Frederick. Four *Hygeia* subscriptions have been placed in Boulder County rural schools. All members of the auxiliary are busy with some form of Red Cross work.

### Illinois

The Adams County auxiliary has been placed in charge of the Blood Donor Service in the county by the American Red Cross. The women of the auxiliary also assist a mobile unit which is sent to Quincy from St. Louis.

### Iowa

Sixty-eight members attended a meeting of the Woman's Auxiliary to the Polk County Medical Society, March 3, at which Dr. Thomas A. Burcham of Des Moines spoke on "The Work of the Iowa Industrial and Defense Commission." A contribution to the Nurses Student Loan Fund was voted. The auxiliary decided also to provide hostesses twice a month for the U S O Recreation Center in Des Moines and to serve refreshments.

The auxiliary to the Waterloo Medical Society met at the home of Dr. and Mrs. John E. O'Keefe in Waterloo. Twenty-six members were present. Mrs. William R. Hornaday of Des Moines, state president, spoke on the Nurses Student Loan Fund.

### New York

The Oswego County auxiliary gave a \$50 donation to the Red Cross, the proceeds from the fashion show.

At a recent meeting of the Queens County auxiliary a \$10 donation was given to the Red Cross War Fund Drive.

### West Virginia

Mrs. B. D. Smith presided and twelve members attended a recent meeting of the Logan County auxiliary. Dr. E. W. Smith, secretary for Foreign Mission, addressed the group on "Mexico."

Mrs. Traul, chairman, reported on the recent benefit bridge party. A total of \$97.74 was raised for the Red Cross fund.

The Woman's Auxiliary to the Marion County Medical Society held an all day health institute recently in Fairmont. During the morning Mrs. Howard Jones and Mary Jane Minnis, R.N., spoke on "Prenatal Clinics", H. S. Burnette, D.D.S., on "Dental Hygiene", Mrs. W. A. Walton, Marguerite Hays, R.N., and Ethel Elfenbein, R.N., on "Well Baby Conference", Dr. C. F. McClintic on the "State Department of Health", Dr. A. M. Price on "Communicable Diseases", Dr. J. W. Davis on "Marion County Health Program" and Mr. W. B. Kirchman on the "City Water Department".

After luncheon, Dr. K. Y. Swisher, president of the Marion County Medical Society, Miss Mabel W. Perry of the State Bureau of Nutrition and Dorothea Campbell, director of the Bureau of Health Education, spoke on "Pooling Our Resources for Health Education", Dr. Justus Pickett on "Public Health", Florence Kneisel and May Gribble, R.N., on "Red Cross Nursing", and Mr. Floyd Prunty on "Marion County Board of Health Education". "White Battalion," a movie, was shown by the Fairmont General Hospital and a first aid demonstration was given by the Koppers Coal Company first aid team.

Dr. Swisher presided at dinner, after which Dr. I. C. Leplace, chief, Department of Pediatrics, Jefferson Medical College of Philadelphia, spoke on "The Art of Growing Up".

The auxiliary placed health exhibits in the public room of the hotel. More than five hundred persons attended the institute and the exhibits.

## Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDI G FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS CE ERAL INTEREST SUCH AS RELATE TO SOCIETY ACTI VITIES NEW HOSPITALS EDUCATION AND PUBLIC HEALTH)

### CALIFORNIA

**Grant for Research in Ophthalmology**—The Columbia Foundation, San Francisco, has given \$20,000 to finance a research project in ophthalmology at the Mount Zion Hospital Research Laboratories, San Francisco, under the direction of Drs. Frank H. Rodin and Charles Weiss. The work will include a study of bacteriology and immunology of the eye. First it is planned to study the flora of the normal eye and of the common eye diseases. Later the study of special problems will be undertaken. The Columbia Foundation was established in 1940 in the interest of educational, cultural and philanthropic activities, internationally.

### COLORADO

**State Society Cancels Annual Meeting at Colorado Springs**—A telegram signed by Drs. Guy C. Carr and Ralph S. Johnston, president and president-elect, respectively, of the Colorado State Medical Society, announces that the board of trustees has voted unanimously to cancel the annual session of the society which was scheduled to be held in Colorado Springs, September 23-26. This action was taken in view of the governmental request for curtailment of all travel not vital to the war effort and in view of the fact that many of the physicians who would have attended the annual session will be in the military service while those not in military service must remain close to their civilian duties. The house of delegates of the Colorado State Medical Society, however, will meet in Denver September 23 to transact the necessary annual business and coordinate medical military activities in Colorado.

### CONNECTICUT

**Personal**—Ira V. Hiscock, CPH, was elected president of the New Haven Board of Health at a meeting on June 17 to succeed the late Mrs. Edward G. Buckland. Mrs. Samuel C. Harvey and Dr. William C. McGuire have been named members of the board to succeed Mrs. Buckland and the late Dr. James D. Trask.

**State Medical Election**—Dr. George M. Smith, Pine Orchard, was named president-elect of the Connecticut State Medical Society May 20, and Dr. Roy L. Leak, Middletown, was inducted into the presidency. Dr. Creighton Barker, New Haven, was reelected executive secretary. New Haven was selected as the place of the next annual session in May 1943.

**Physicians Honored**—Physicians from Norwalk, Stamford, Danbury and Bridgeport gave a dinner in Westport recently to honor Dr. William S. Stone, who was presented with a gold plaque on behalf of the Norwalk Medical Society. The inscription on the plaque stated that the testimonial was "in deep appreciation of his humanitarian and scientific efforts on behalf of this community." The new Louis I. Mason Memorial Nurses' Home at the Windham Community Memorial Hospital, Willimantic, was opened with appropriate ceremonies recently. The home was given by the widow of Dr. Mason as a memorial to him. Dr. Mason died in 1930, aged 64.

### ILLINOIS

**Society News**—At its recent annual meeting in Chicago on May 9 the Illinois Psychiatric Society elected Drs. Francis J. Gerty, president, Franz G. Alexander, vice president and Eugene I. Falstein, secretary-treasurer. All are of Chicago.

#### Chicago

**Course in Electrocardiography**—Michael Reese Hospital will offer a full time course in electrocardiography August 17-29 under the direction of Dr. Louis N. Katz, director of cardiovascular research. Additional information may be obtained from the hospital. There will be sessions on interpretations of electrocardiograms, and emphasis will be placed on chest leads and on the importance of the electrocardiogram in coronary sclerosis and myocardial infarction.

**Dr. Fred Adair to Retire as Professor**—Dr. Fred L. Adair, chairman of the department and Mary Campau Ryerson professor of obstetrics and gynecology, University of Chicago School of Medicine and chief of service at the Chicago Lying-In Hospital, will retire on October 1, having reached the age of

retirement. He will be succeeded by Dr. William J. Dieckmann, associate professor in the department. Dr. Adair, who was born in Iowa in 1877, graduated at Rush Medical College in 1901. He became associated with the University of Minnesota in 1905, serving there as professor of obstetrics and gynecology from 1926 to 1929. He was secretary of the Section on Obstetrics and Gynecology of the American Medical Association from 1928 to 1931 and chairman from 1931 to 1932. In 1922 Dr. Dieckmann graduated at Washington University School of Medicine, St. Louis. He later served in various capacities in the department of obstetrics, resigning in 1929 to join the Chicago faculty.

### KANSAS

**New Psychiatric Group**—The Kansas Psychiatric Society was organized at an informal meeting April 9, at the Hotel Kansas, Topeka. At the first regular meeting April 22 Dr. Robert P. Knight, Topeka, was elected president and Dr. Edward D. Greenwood, Topeka, secretary-treasurer. The new society will have about thirty charter members and will hold quarterly meetings.

**Changes in Health Personnel**—Dr. David D. Carr, formerly a member of the Utah State Board of Health, Salt Lake City, has been named full time health officer of Topeka, effective June 1. Dr. Carl W. Plowman, Jewell, has been appointed health officer for Jewell County, succeeding the late Dr. Spencer B. Dikes, Esbon. Dr. Denman T. Gammell, Ulysses, has been named health officer of Grant County.

### MICHIGAN

**Beaumont Room in Detroit**—The Wayne County Medical Society, Detroit, has set aside a room in its headquarters to be developed as the Beaumont Room. The lectureship foundation committee, which for a number of years has been arranging the annual Beaumont lectures for the society, is collecting material to be displayed permanently in the room and it is planned to hang there a painting of Beaumont which is now being made by Dean Keller. The painting is to be a replica of the one which hangs in the Cushing Library at Yale University School of Medicine, New Haven, Conn. It is hoped that when the next Beaumont lectures are delivered probably early in 1943 the portrait will be hung and Beaumont memorabilia will be ready for exhibition. The committee has already received a first edition of Beaumont's book, two editions of Pares' Opera, and some other valuable items from an anonymous donor. The committee has been authorized by the society to accept any gifts which interested persons may wish to donate to the collection.

### NEW JERSEY

**Radiologists Choose Officers**—The Radiological Society of New Jersey chose the following officers at its recent annual meeting: Dr. William J. Marquis, Newark, president; Dr. Herbert A. Vogel, Elizabeth, vice president; Dr. Harry J. Perlberg, Jersey City, secretary; and Dr. Charles P. Oderr, Westfield, treasurer.

### NEW YORK

**Society Limits Rounds of House Calls**—The Cayuga County Medical Society has announced a policy, aimed at conserving fuel and rubber, which limits the calls of its members to two regular rounds of house calls, one in the morning and one in the afternoon. Emergency calls will be taken care of at any hour, but routine visits will be reduced to these two calls, according to newspaper reports May 19.

**Physician Honored**—Dr. Irving W. Potter, Buffalo, was honored on July 7 when a bronze plaque was unveiled in the new obstetric wing of the Millard Fillmore Hospital, Buffalo. The speakers at the ceremony included Drs. James E. King, professor emeritus of gynecology at the University of Buffalo School of Medicine, Charles J. Reynolds, who for thirty-five years has served as anesthetist to Dr. Potter, and George A. Himmelsbach, Buffalo. Dr. Potter is a past president of the Medical Society of the County of Erie and the Buffalo Academy of Medicine and formerly served as chief of the obstetric department of the hospital.

#### New York City

**Personal**—Dean Sage, Jr., attorney, has been appointed executive vice president of the United Hospital Fund of New York. Dr. Luthero Vargas of Brazil was guest of honor at a dinner given on June 29 at the New York Academy of Medicine under the auspices of the members of the Inter-American Division of the Academy and of America Clinica. Dr. Vargas has been visiting various hospitals throughout the United States in recent months to assemble ideas to include in

his new wing of orthopedics for the treatment of school children at the Centro Medico Pedagogico Oswaldo Cruz of Rio de Janeiro—Dr Robert L. Dickinson, formerly president of the American Gynecological Society, has recently been appointed a life fellow of the association.

**A Million for Public Health Research**—The Public Health Research Institute of the City of New York, Inc., will receive \$100,000 a year for ten years for its researches on public health, according to authorization of the board of estimate announced in the *New York Times*. The city and the institute, a nonprofit scientific institution, have entered into a contract which went into effect July 1 and is automatically renewable for similar periods of ten years unless previously abrogated. The money is to be used by the institute to carry on fundamental medical research by a staff of competent scientists under the direction of a research council composed of authorities in the fields of medicine, biology, physiology, nutrition, public health and related fields. The contract was signed after the legislature passed a bill authorizing cities to enter such contracts with nonprofit scientific institutions to carry on "research into matters pertaining to public health." Under the contract, the services to be rendered by the institute include the following:

Research and investigation into the control of diseases such as influenza, poliomyelitis, arthritis, degenerative diseases and general physiologic problems such as nutrition.

Generally to engage in laboratory experimentation and research in order to develop better and more economical biological products and improved technical procedures for use in combating diseases and epidemics.

To aid and assist the director of the bureau of laboratories of the department of health in matters involving public health research.

The city, on its part, agrees "to permit the institute to use and to make available for such use part of the premises now occupied by the bureau of laboratories of the department of health at the William Hallock Park Laboratory, or any other building or premises owned, leased or controlled by the city suitable or proper for laboratory investigation and research, during the term of this agreement or its renewal, without any charge for rent, water, heat, light, janitorial services and maintenance. The annual payments of \$100,000 for the ten year period will be paid in quarter annual payments each year. The results of the institute's research "shall be the property of the city." Any discoveries of products or methods shall belong to the city as soon as made, for which there shall be no compensation. All patents issued to the city or to any of its employees shall be assigned immediately to the city, for which there shall be no compensation. David M. Heyman is president of the board of directors of the institute. Other members include the mayor, the controller, Health Commissioner John L. Rice, David Rockefeller, vice president, Edwin F. Chinlund, treasurer, and David Morse, secretary. The research council, in charge of all scientific programs, will be directed by Dr. Thomas M. Rivers of the Rockefeller Hospital. Other members are Dr. Eugene L. Opie, Dr. Henry L. Sherman, Dr. George Baehr, Michael Heidelberger, Ph.D., and Dr. Ralph S. Muckenfuss, director of the bureau of laboratories.

## OHIO

**Fifty Years of Practice**—The Tuscarawas County Medical Society gave a dinner in New Philadelphia, June 11, in honor of Drs. Clarence D. Kurtz, New Philadelphia, and George B. Kistler, Newcomerstown, who have completed fifty-one and fifty years, respectively, in the practice of medicine. Other members of the society who have completed fifty years in the practice of medicine and who bring the total to seven are Drs. Elliott D. Moore, New Philadelphia, fifty-five years, James M. McCollam, Uhrichsville, fifty-three years, Joseph Blickensderfer, New Philadelphia, fifty-two years, Byron G. Anderson, Uhrichsville, fifty-five years, and George A. Henry, Tuscarawas, fifty-one years.—Dr. Mark Millikin, Hamilton, was guest of honor at a dinner, May 27, given by the Butler County Medical Society to observe his completion of fifty years in the practice of medicine. He was presented with a gold watch by the society. The speakers included Dr. Wilmer E. Griffith, Hamilton, secretary emeritus of the society, and Dr. Martin H. Fischer, Cincinnati.

**Physicians Seek to Incorporate Medical Care Plan**—Nine physician members of the Academy of Medicine of Cleveland have submitted to the secretary of state papers for incorporation of a medical care plan to be known as the Cleveland Medical Service Association, according to the *Cleveland Plain Dealer*, June 20. The physicians are Drs. Harry V. Paryzek, former president of the state medical association, John E. Rauschkolb, president of the academy, Richard Dexter and Jacob E. Tuckerman, former presidents, Edward F. Kieger and William E. Hill, directors of the academy, Demba M. Spicer, Lakewood, a member of the academy's committee on economics, Milton B. Cohen, and Dwight S. Spreng, chairman of the

economics committee. The newspaper pointed out that since a recent vote by the academy on a medical care plan lost by only five votes and it was obvious there was a strong feeling that Cuyahoga County citizens should have a medical care plan, these physicians as individuals assumed leadership in that direction. The purpose of the plan is "to establish, maintain, and operate a voluntary, nonprofit medical care plan within the limits of Cuyahoga County whereby professional service will be provided to such persons as shall become subscribers to such plan." The most recent medical care plan worked by the economics committee, approved by the academy directors and rejected by the members of the academy, will be used as a working basis after incorporation, it was stated. The plan will probably be checked by state insurance and medical boards. Then, according to law, it will have to receive the support of 51 per cent of physicians residing in and actively practicing in the county. How Cleveland physicians now in military service will figure in the plan is another technicality which will have to be ironed out, it was said.

## OREGON

**Society News**—Physicians and dentists of Klamath and Jackson counties met jointly with the Southern Oregon Medical Society, June 13, to hear, among others, Dr. Leo Eloesser, San Francisco, discuss "Treatment of Compound Fractures in War Time" and Henry Cline Fixott, D.M.D., Portland, "Plangraphy of the Teeth and Head."—Dr. Eugene R. Kellersberger, New York, spoke on "Tropical Diseases" before the Multnomah County Medical Society, Portland, April 24.

**Personal**—Ralph E. Jackson, Salem, former claim supervisor of the Oregon State Industrial Accident Commission has been named general manager of the Multnomah Medical Service Bureau. This is the first time the bureau, which carries the approval of the state medical society and the Multnomah County Medical Society, has employed a full time general manager.—Dr. Harold B. Stout, formerly of Patuxent, Wash., has been appointed health officer for Douglas County.—Florence Peebles, Ph.D., since 1935 professor of biology at Chapman College, Los Angeles, has been appointed director of the biologic laboratory of Albany College, Portland.

## PENNSYLVANIA

**District Meeting**—The Eighth Council District of the Medical Society of the State of Pennsylvania was addressed at Conneaut Lake, July 15, among others by Drs. Irwin M. Pochapin, Pittsburgh, on "Medical Aspects of Chemical Warfare" and Roy R. Snowden, Pittsburgh, "Recent Advances in Our Knowledge of Hypertension." On behalf of the state society, Dr. Walter F. Donaldson, Pittsburgh, secretary of the state society, presented fifty year testimonial certificates to Dr. Robert W. Brown, Greenville, John F. Rutherford, Haverhill, and Owen M. Shreve, Erie.

## Philadelphia

**Personal**—George W. Patterson, Ph.D., assistant professor in bacteriology and director of athletics, Philadelphia College of Pharmacy and Science, has been elected president of the Alumni Association of the college. Dr. Jack I. Lemmon has been appointed a member of the teaching staff, succeeding Dr. Edward A. Mullen, assistant professor in pharmacology, on leave of absence and serving as commander in the U.S. Navy.

## TEXAS

**University and Foundation Cooperate in Medical Center**—An agreement between the Southwestern Medical Foundation and Baylor University to set up a medical center in Dallas was approved at a special meeting of the executive committee of the Baptist General Convention on July 7. The project has been under consideration for eight months. Under a first year contract the medical and dental schools of the university will be moved, as soon as buildings are provided to a tract along Hines Boulevard and including Parkland Hospital. Under the contract one million dollars will be expended in foundation for buildings for medical teaching construction start within a period of not less than two years after removal of priority restrictions. Parkland Hospital will be enlarged to become an integral part of the center, its facilities to be in connection with the medical and dental college. The center is within a few blocks of a large group of hospitals, including the Children's Hospital of Texas, the Rite Hospital for Crippled Children, Hope Cottage Memorial Hospital for Babies and Freeman Memorial Hospital. The agreement places the two schools under the joint board including three members from the university and two from Baylor. The university, which has been

vision of the executive board of the Baptist General Convention will be conducted on a nonsectarian basis. Development of the medical center will be in cooperation with the city county hospital board administering Parkland Hospital where the first run of the medical foundation will be to improve clinical facilities. A dispensary will be the first unit in the new construction program. In addition to providing the buildings, the foundation will also furnish money for teaching. The medical school will continue to receive income from endowment, but Baylor University will retain the endowment fund. All student fees will go into the fund for teaching.

### WISCONSIN

**Full Time Tuberculosis Secretary**—Dr. Oscar Lotz, Milwaukee since 1939 part time executive secretary of the Wisconsin Anti-Tuberculosis Association, has been appointed to a full time basis. Dr. Lotz has been serving on a part time basis since the death of Dr. Hoyt E. Dearholt, for many years secretary of the association. He plans to give up his private practice.

**Physician Observes Ninety-Sixth Birthday**—Dr. John G. Meachem, Racine, a life member of the State Medical Society of Wisconsin, recently celebrated his ninety-sixth birthday. Dr. Meachem graduated at Rush Medical College in 1865. For many years he served as a member of the municipal board of health of Racine. In 1932 he donated a chapel and library to St. Luke's Hospital, Racine, of which he with his father, Dr. John G. Meachem Sr., was one of the incorporators. The chapel is a memorial to his wife, and the library commemorates three generations of his family who have been physicians. His son, Dr. John G. Meachem III, died in 1926.

**Society News**—The Milwaukee County Medical Society was addressed on May 8 by Drs. Walter P. Blount, Milwaukee, and Philip S. Hench, Rochester, Minn., on "The Kenny Treatment of Poliomyelitis" and "The Management of Rheumatoid Arthritis," respectively. Dr. John E. Gonce, Jr., Madison, discussed "Some Aspects of Urinary Infections in Infants and Children" on May 21 before the Racine County Medical Society. At a joint meeting of the Winnebago County Medical and Dental societies on May 7 in Oshkosh, Dr. Kenneth W. Penhale, Chicago, spoke on "Traumatic Injuries to the Face." Dr. Philip Levine, Newark, N. J., discussed "Isomunization: Practical and Theoretical Considerations" before the University of Wisconsin Medical Society in Madison recently.

### GENERAL

**Grants for Research on Infantile Paralysis**—The National Foundation for Infantile Paralysis, Inc., has given a total of \$325,841.25 to twenty-six institutions in the United States and Canada to carry on virus and after-effect research work and education in the campaign against infantile paralysis. The funds were taken from the proceeds of the foundation's programs observing the President's birthday. The grantees and the amount of each grant follows:

#### For After-Effects Research

### FOREIGN

**Public Health Under Hitler's Rule**—A few hundred cases of smallpox were verified recently in Paris, and those engaged in public positions have been required to be vaccinated according to the *Göteborgs Handels- och Sjöfarts-Tidning* of April 7. French physicians unanimously state that illness is much more prevalent in France as a result of the present dietary restrictions. An increase has occurred in the number of operations for hernia, nephroptosis and organic disorders peculiar to women, owing, it is said, to the loss in weight and the consequent reduction in fatty tissue which normally holds the organs in their proper position. Fractures of bones have been extremely common, especially in old people who are not getting enough calcium, phosphorus and vitamin D in their food to maintain adequately the bone structure. More cases of rickets are being reported. Convalescence following operations is delayed. Many surgeons complain that operative wounds do not heal as readily as formerly, they have difficulty in stopping hemorrhage following operations, infections are more common because of lack of antiseptics, operating rooms cannot be adequately heated and bandage material is getting low.

According to the *Berliner Borson-Zeitung* of April 24, the general picture in public life is one of nervousness and short temper. Everywhere, it is said, one has to witness rows. To appreciate the meaning of politeness one need only witness how the fuhrer receives and takes leave of his guests at his front door.

The *Vir* of Sofia, April 15, stated that the Directorate of National Health has ordered that all products used as substitutes for coffee or tea, such as soy beans, chick-peas, almonds and carrots, must be sold under their proper names and that it is forbidden to use the word "substitute."

J. Lhost in *Le nouveau journal*, April 21-22, writes about the housing conditions. In addition to the fits of nostalgia suffered by the Belgian workers in Germany, there is the more or less comfortless home life which they endure. The reich is suffering from a great lack of housing accommodation. Circumstances have not permitted the construction of suitable houses to be carried out on the same scale as the terrific influx of foreign workers. The present conflict has interrupted Hitler's plan for the erection of workmen's dwellings, and the Germans themselves find it difficult to obtain accommodation. In order to satisfy the most pressing needs the Germans have had hurriedly to put up provisional barracks and in some of the larger towns to commandeer whole hotels to furnish lodgings for the workers. These emergency measures and overpopulation have resulted in a sort of local bottleneck the result of which is an unpleasantly crowded communal life, collective kitchens and a kind of intermittent camp life. Such drawbacks are not very serious in themselves and the workers do not exaggerate them, but, taken in conjunction with the effects of the general nostalgia, they produce results which the German labor front is doing everything in its power to avoid.

### Government Services

#### Course in Occupational Dermatoses at National Institute of Health

The U. S. Public Health Service will give a course in occupational dermatoses at the National Institute of Health, Bethesda, Md., stressing the war industries, July 27-August 5. The course will consist of six days of lectures, four hours daily, and six days of visits to six plants which manufacture war materials. The number of applications received for taking the course completely fills this present class, but if there is a demand from a sufficient number of dermatologists it is possible that another course may be given. Applications for the course should be sent to Dr. Louis Schwartz, medical director, Dermatoses Investigations Section, National Institute of Health, Bethesda, Md.

### CORRECTION

**Dr. Arthur D. Munger**—In THE JOURNAL, July 4, page 812, second column, third line from the bottom, the name Dr. Arthur D. Munger, Lincoln, Neb., should have been Dr. Arthur D. Munger, Lincoln, Neb. At the June 12 meeting of the Section on Urology of the American Medical Association, Atlantic City, Dr. Munger was elected vice chairman of the section.

Lives Saved by Iron Table Shelters

The latest form of shelter against bombing is an iron table capable of sustaining many tons. In a recent raid the value of the shelter was shown by the escape of an adult and two children in a home demolished by a direct hit. This occurred in spite of the fact that the shelter was hurled 46 feet over an outdoor shelter and into a first floor room of another house. When assisted from the shelter the adult and one child were found to be injured and were taken to a hospital, where they are recovering. The other child was unhurt. In another case, as the result of a direct hit, the debris of a two story building completely buried a table shelter on the ground floor. When rescuers arrived five persons were helped out, shaken but uninjured. In a third case in which the house was demolished, the shelter was lifted sideways 6 feet and upward 4 feet onto debris. The shelter held four persons, who were unhurt. A report of the experts of the Ministry of Home Security on thirty-nine bombing incidents in which the table shelters were involved shows that they have stood up well to severe tests. Of one hundred and nineteen persons in these shelters only four were killed, seven were seriously injured, fourteen were slightly injured and ninety-four escaped uninjured.

Casualties of the British Empire in the First Two Years of the War

In the House of Commons Mr Attlee, secretary of state for the dominions, gave the casualties in the armed forces of the British Empire from Sept 3, 1939 to Sept 2, 1941 (excluding deaths from natural causes) as

|                  | Officers | Other Ranks | All Ranks |
|------------------|----------|-------------|-----------|
| Killed           | 6,206    | 42,677      | 48,973    |
| Wounded          | 4,061    | 42,299      | 46,360    |
| Prisoners of war | 3,374    | 55,081      | 58,455    |
| Missing          | 953      | 28,803      | 29,756    |
| Total            | 14,687   | 168,860     | 183,547   |

New System for Hospital Outpatients

Before the war the need for a scheme to curtail the long period of waiting for patients attending the outpatient department of Guy's Hospital was recognized. The fact that many of these patients are now engaged in work of national importance and can ill afford to wait long hours has made the problem urgent. Under the previous system the waiting period extended to three or four hours. A new system has been introduced under which appointments are made in hourly blocks, so that one batch of patients attends from 9.30 to 10.30, the next from 10.30 to 11.30 and so on. Thus no patient has to wait more than an hour and many much less. The number of patients booked for each hour varies in different clinics. It has been found that physicians deal with 2 to 4 new cases an hour or 8 old cases, but surgeons see 6 new cases an hour. An unavoidable disadvantage of the scheme is that patients who are booked may fail to attend and make a gap in the sequence of cases. This sometimes can be filled by other patients, but on occasions the physician has to wait for the next patient. On the whole the new scheme has proved advantageous. It relieves the congestion of the outpatient department and succeeds in its main object of relieving the waiting period. It permits the nurse to prepare more efficiently for the management of the session.

The Head Louse and Modern Hairdressing

The managing director of a well known firm of hair dressers has written to the Times suggesting that, contrary to common belief, permanent waving is conducive to hair hygiene and elimination of the head louse. This led to a reply from Kenneth Mellanby of Sheffield University, who recently made a report of an investigation, undertaken on behalf of the Board of Education and the Ministry of Health, into the incidence of the head louse. He wrote "Modern styles of hairdressing are, unfortunately, likely to favor an increase of the number of head lice. I have heard of frequent cases of young women with long permanently waved hair which is apparently never disturbed for weeks and which forms an ideal breeding ground for parasites." He has since learned that the reason these women do not comb their hair is not the permanent wave. Two processes are involved in producing an elaborate coiffure. First, if the hair is straight its structure is deformed to produce a result like natural waviness. This change is permanent and will survive brushing and washing. The second process consists in "setting" the hair, which may be arranged in any type of bizarre confection. This "set" is a delicate structure, easily disturbed, and its production requires time, patience and skill. Mellanby says that the hairdressers will do much to reduce the incidence of the head louse if they can persuade women to avoid elaborate "sets," which, because of the difficulty of replacing them, are often left uncombed and unwashed for long periods. Further, the shorter the hair the less liable it will be to louse infestation.

Effects of the War on Human Fertility

The birth rate has fallen to a level which in the near future means a decline of population. The number of persons in this country between the ages of 14 and 64 is 33 million, and two thirds of them are engaged in the war effort, whether in the armed forces, civil defense or war industries. No country has ever before mobilized its man power to the extent we have. The effect of the war on the birth rate is interesting. Except as it causes a temporary loss of births by separation of man and wife and a permanent loss of potential fathers and mothers by violent deaths, it seems that the war may have a favorable effect on fertility in the long run by bringing about a change in values and removal of some of the deterrents to childbearing. There has been a remarkable increase in marriages. This is in part due to the large number of girls reaching the ages of 19 and 20 owing to the high birth rate which followed the last war. But more important are the allowances provided for the wives of the fighting men. The birth rate for the first quarter of 1942 was higher than for any other first quarter since 1931, in spite of the disruption of family life produced by the war, including the bombing of our cities and their evacuation on a large scale.

Demand for Further Measures in Prevention of Venereal Diseases

At a meeting of the Medical Society for the Study of Venereal Diseases a discussion on the need for further measures to deal with sources of infection, contacts and derelicts was opened by Major S. M. Laird. He pointed out that a person is free to have venereal disease and to communicate it as much as he chooses and is not obliged to be treated or to continue treatment until cured or rendered noninfective. He is under no obligation to assist in tracing his infective contacts who is free to refuse examination and treatment. In the absence of notification no accurate knowledge of the prevalence of these diseases exists. Control is prevented in the first place by three factors—technical imperfection of the notification system, the defaulting patient and the untraced sources of infection and their contacts. Venereal diseases should be dealt with

by practitioners who have successfully passed through post-graduate instruction in them. The defaulter rate is high, in 1935 only 17.5 per cent of patients completed treatment and tests of cure at the treatment centers. The corresponding figure for Sweden was 97.5 per cent. The New York commission which in 1936 studied antivenereal methods in Britain and Scandinavian countries reported in favor of the compulsory powers in use in the latter. The cases of syphilis reporting for the first time in Stockholm in 1935 were only 5 per cent of those in 1919. In Liverpool the corresponding figure was 37 per cent. The British minister of health should without delay arrange for survey of the venereal disease problem in this country with a view to a trial of notification and compulsory measures. There was also need for intensive education of the public as to venereal diseases.

In the discussion there was general agreement as to the demand for compulsory powers. The resolution was passed unanimously 'that in the opinion of this meeting of the Medical Society for the Study of Venereal Diseases further measures, legislative and administrative, in the treatment and prevention of venereal diseases are required to deal with defaulters, sources of infection and contacts.'

### The Collection of Medicinal Plants

Before the war we imported most of the medicinal plants we required, as we did most of our food and of many other things. But the need to devote as much shipping as possible to purposes of the war has compelled us to develop and use our home resources. In normal times many hundreds of tons of medicinal plants which could be gathered from the countryside were imported. Even such common plants as dandelions and stinging nettles were imported for the manufacture of drugs. This year the collection of medicinal plants is being organized on wide lines. Herb committees have been set up in forty-eight counties to arrange the collection, drying and dispatch to the manufacturers. Schools and youth organizations are helping in the collection. Among the wild herbs now being collected are buckthorn, red poppy petals, elder flowers, comfrey, coltsfoot, horse radish, hyscop, hemlock, henbane, foxglove, dandelions and stinging nettles.

### The Immunization of Children Against Diphtheria

The Ministry of Health has issued a memorandum drawing attention to an increase in the dosage of alum precipitated toxoid for the production of artificial immunity against diphtheria which experience has shown to be desirable. At the end of 1940 the ministry undertook to provide gratuitously this prophylactic. The laboratories responsible for the distribution were informed that as a result of large scale trials a Schick conversion rate of about 98 per cent had been obtained with two doses of 0.1 and 0.3 cc respectively at an interval of not less than four weeks. This dose was generally adopted. But it was soon found that one preparation of alum precipitated toxoid, though satisfying the regulations yielded a much lower Schick conversion rate than 98 per cent and its issue was stopped. Further tests showed that the unsatisfactory results were not due to small doses employed but to a fundamental defect in antigenic potency.

It has been realized for some time that the assessment in the laboratory of the antigenic potency of alum precipitated toxoid presents considerable difficulty and that the tests laid down by the Therapeutic Substances Act may need revision. A more satisfactory method of preparing alum precipitated toxoid has recently been published and is available to all manufacturers. Tests carried out with the product have yielded satisfactory results with a dose of 0.1 and 0.3 cc. at four to six weeks interval. Nevertheless certain considerations suggest an increase of the dose to widen the margin of safety.

Therefore it is recommended that doses should be raised to 0.2 and 0.5 cc. The increase in the first dose is recommended mainly on practical grounds. The full quantity of antigen may not be introduced owing to an imperfectly calibrated syringe or to an escape of some of the inoculum. Another reason may be lack of uniformity of the inoculum, owing to neglect to shake the bottle thoroughly or to sedimentation in inoculating successive children. In issuing this memorandum the ministry takes the opportunity to emphasize that the immunization of children between the ages of 5 and 15 years will not alone suffice to reduce materially the incidence of diphtheria. This can be achieved only if a majority of the children of preschool age also are immunized. Children thus protected early should receive a supplementary dose of 0.5 cc. on beginning school life.

### Mass Radiography for the Detection of Tuberculosis in Recruits

The minister of labor and national service has presented to Parliament a report of his medical advisory committee, of which Lord Horder is chairman, on mass miniature radiography in the detection of pulmonary tuberculosis in recruits for the services. Requests were made by the National Association for the Prevention of Tuberculosis and by the Standing Advisory Committee on Tuberculosis that this method should form a normal part of the examination of recruits. Some two hundred recruits can be dealt with in an hour, but the photographs must afterward be processed and interpreted by tuberculosis specialists. The committee has no doubt of the value of the method and repeats an opinion previously expressed that its addition to the clinical examination of all recruits and to the radiologic examination by specialists of suggestive cases would be ideal. But for various reasons it is not practicable. The medical examination of recruits is done at two hundred centers and there are neither the machines nor the staffs available for all these boards.

The best alternative would be radiologic examination to the greatest number practicable after entry into the services, when recruits can be concentrated for the purpose at suitable depots. The committee commends steps already taken in this direction. The navy has examined many thousands by mass radiography, and active pulmonary tuberculosis was discovered in 0.3 per cent. The naval experience shows that it is far more important to examine trained men than recruits, as the majority of nonsymptomatic carriers of tubercle bacilli are found after they have been some time in the service rather than at the time of joining. In the air force the percentage of tuberculous found after joining was 0.2 and in the army 0.1. Measures already adopted by civilian medical boards have resulted in the rejection of about 1 per cent on account of pulmonary tuberculosis. This corresponds roughly with what is believed to be the incidence in the general population. The experience of the service examinations is that the number of cases of tuberculosis which the civilian boards failed to detect is between 1 and 2 per thousand. Thus the problem is of small magnitude.

### Cancer Research

The eighteenth annual report of the British Empire Cancer Campaign deals with the carcinogenic activity of many new synthetic compounds. British laboratories have led the way in the study of cancer producing and cancer inhibiting substances. In the research institute of the Cancer Hospital a research has been undertaken on seventy compounds, mostly new chemical substances synthesized for the purpose. The results support the view that there is an association between molecular structure and carcinogenic action. An attempt has been made to determine the occurrence of carcinogenic factors in the body. By subcutaneous injection of extracts of human liver obtained from cases of cancer seventeen sarcomas have been produced.

in mice. Attempts are being made to identify the active constituent of these extracts. The results so far obtained are difficult to interpret but form an encouraging basis.

The possibility that wood smoke, much used for food preservation, might contain carcinogenic substances has been investigated at the Cancer Research Laboratory, Newcastle-upon-Tyne, with negative result. At the Oxford University research center of the campaign investigations have been carried out on the striking augmentation of carcinogenesis when croton oil acts on mouse skin in conjunction with a dilute solution of benzpyrene. This effect has been traced to a croton resin in the oil. It has also been shown that this resin can convert a preneoplastic into a neoplastic lesion. The fact that this can be brought about by substances not themselves carcinogenic may have important clinical implications.

The clinical cancer research committee of the campaign is investigating the records of 15,000 cases. This year uterine cancer is the object of detailed study. Dr Percy Stocks of the General Register Office has made some interesting observations on the statistical significance of these returns. The liability to cancer of the cervix is greater at every age among married and widowed than among single women, especially between the ages of 45 and 65, when it is about seven times as great. But liability to cancer of the corpus uteri is somewhat less among married and widowed women than among single women. Only 26 per cent of patients suffering from uterine cancer consulted a physician within the first month of noticing the first symptoms, and only 45 per cent within the first three months. In 75 per cent of the cases the physicians made an examination promptly and referred the patient to the hospital.

#### IRRADIATION OF MALIGNANT TISSUES

The reaction of normal tissues following irradiation by surface doses of the order of 300 to 400 roentgens per minute was found to be less intense than from the same quantity and quality of radiation given at a dosage rate of 20 roentgens per minute. But the reactions of malignant tissue to high intensity was earlier and greater than that produced at lower dosage rates. The enforced use of radon for radium has raised the question whether the same physical dose of the gamma rays has the same biologic effect. No difference could be found experimentally or clinically. At St Bartholomew's Hospital work is being done with the million volt apparatus. A difference from the results of treatment of cancer of the rectum treated with the 200,000 volt apparatus is that temporary disappearance of the growth was more often observed.

#### A Register of Civilian War Dead

The Imperial War Graves Commission, which was established after the last war to take care of the graves of the many thousands of killed, has in this war made contact with the relatives of 67 per cent of the civilian war dead. Of these forty-two thousand were killed in Britain from the beginning of the war to the end of September 1941. The commission has obtained personal details for inclusion in a register which is being prepared. In order to make this as complete as possible a special appeal is being made to relatives or friends who have not replied to the commission's letter. The value of a personal communication was shown when a man from the East End of London called after receiving the usual letter concerning his daughter. He was able to supply details of more than twenty members of his family who had been killed. The ages of the civilian war dead range from 11 hours to 100 years.

#### University Adopts Health Tests for Students

As previously reported in *THE JOURNAL*, the routine medical examination of the young on leaving school, particularly x-ray examination of the chest for the detection of tuberculosis, is advocated. This procedure has now been adopted at one university, that of Sheffield. At first the examination was optional

and the number of students who availed themselves of it was small—not more than 20 per cent. It has now been made compulsory. In other faculties than medicine it will not include x-ray examination of the chest. The medical student will not only undergo radiologic examination of the chest on entrance but have a second one, with a sedimentation test, when he begins his clinical work, and a third one at the end of his second clinical year. The object of this repeated examination of the chest is not only to benefit the student but to prevent him from conveying infection to the patients with whom he will be in contact.

#### New Portable Machine for Administering Anesthetics

The first two hundred machines which will simplify emergency operations in the field and in air raids was presented by Lord Nuffield, the automobile magnate, to the director general of Air Force Medical Service. The machine is the Oxford vaporizer which, contained in a vermin proof case about the size of a portable phonograph, will take the place of the cumbersome gas cylinders formerly used to administer anesthetics. In future a medical officer carrying this small case, which weighs 30 pounds, and a small bottle of liquid ether will have all the anesthetic equipment he needs. The vaporizer is the result of several years' research in the Nuffield Department of Anesthetics at Oxford University under the direction of Group Captain R. R. Mackintosh.

Liquid ether is vaporized inside the machine, and the patient inhales the gas. The vaporizer is foolproof and can be worked by any one with expert direction. In hot climates anesthetics evaporate as soon as they are poured on the face mask, often before the patient has time to inhale them. The vaporizer does away with this difficulty. Special experiments are being conducted with sand from the Libyan desert, so that filters can be fitted to prevent sand from affecting the machine.

#### Decree of Nullity of Marriage Obtained by Blood Test

For the first time in this country a blood test has been used in the law courts to disprove paternity. On June 15, 1940 a man cohabited with a woman, who told him a few days later that she was pregnant. He married her in August and left her soon afterward. On Jan. 8, 1941 she bore a full term child. Medical evidence established that the child could not possibly have been conceived in the previous June. The husband sued for a declaration of nullity of marriage on the ground that the woman was pregnant by another man at the time of the marriage. Dr. G. Roche Lynch, the government analyst, gave evidence that he had grouped the blood of the husband, wife, and child. The husband's was OM, the wife's BM and the child's ABN. Therefore the factors A and N in the child's blood were not accounted for and the husband was not the father. The judge declared that the husband's case was established and pronounced a decree of nullity of the marriage.

## Marriages

WILLIAM MASSIE SMETHIE, Richmond, Va., to Miss Lee Harrington of Rocky Mount, N. C., in Chapel Hill, April 4.

HILTON DRUMMOND HAINES, Greenwich, Conn., to Martha Ledbetter of Rockingham, N. C., April 25.

GUY HEWITT BRANAMAN, Waynesboro, Va., to Miss Virginia Ferrell in Ronceverte, W. Va., April 18.

HENRY ST. GEORGE TUCKER JR., Richmond, Va., to Mary Grasty Bell of Staunton, April 25.

GERALD WATTS SCURRY, Columbia, S. C., to Miss Jordan Thomas in Charleston in April.

CHARLES W. HOCK, to Miss Margaret Henkle in Winston-Salem, N. C., April 30.

LEE BRAYTON, Indianapolis, to Miss Louise Kano in Chicago, Ill., April 4.

## Deaths

Leon Kahn Baldauf, Waltham Mass, Johns Hopkins University School of Medicine Baltimore, 1905, member of the Massachusetts Medical Society and the American Association of Pathologists and Bacteriologists, professor of pathology at the Middlesex University School of Medicine at one time professor of pathology and bacteriology at the University of Louisville (Ky) School of Medicine formerly on the staff of the Cambridge City Hospital, aged 64, died recently in the New England Baptist Hospital, Boston

William Aubrey Poole @ Lexington, Ky, St Louis University School of Medicine, 1906, member of the American Academy of Ophthalmology and Otolaryngology, specialist certified by the American Board of Otolaryngology, past president of the Henderson County Medical Society, major in the medical corps of the U S Army during World War I, at one time health officer of Henderson, aged 60, died, June 2, of injuries received in an automobile accident in March

Elmer Douglas Osmun, Allegan, Mich, University of Michigan Homeopathic Medical School Ann Arbor, 1892, member of the Michigan State Medical Society, served in the medical corps of the U S Army during World War I, for many years served on the board of education and as county coroner, examiner for the Selective Service System, aged 73, died, April 23

Howard Kenneth Glidden, Swampscott, Mass (licensed in Massachusetts in 1899) veteran of the Spanish-American War, formerly member of the board of health of Swampscott and school committee, aged 67 died, May 30, in the Massachusetts General Hospital, Baker Memorial, Boston, of heart disease, hypertension and arteriosclerosis

Louis Dorpat, Milwaukee, Milwaukee Medical College 1905, member of the State Medical Society of Wisconsin, formerly deputy state health officer, health officer of Ironwood, Mich, from 1924 to 1931, formerly superintendent of the South View Hospital, aged 70, died, May 25, in the Milwaukee County Hospital of coronary occlusion

John Henry Ramey, Rock Camp, Ohio Miami Medical College, Cincinnati, 1897, president of the board of education of Lawrence County, served in the medical corps of the U S Army during World War I aged 69 died, May 28, in the Lawrence County General Hospital, Ironton of left bundle branch block

Carl Gustav Fahndrich @ Battle Creek Mich, University of Maryland School of Medicine and College of Physicians and Surgeons, Baltimore, 1920 member of the American College of Chest Physicians, medical director of the Calhoun County Public Hospital, aged 47, died, May 31, in a hospital in Chicago

Andrew Cornelious Dorminy, Hoboken Ga Atlanta College of Physicians and Surgeons, 1911 member of the Medical Association of Georgia also a druggist, served during World War I aged 61, died March 19 in the Veterans Administration Facility, Lake City, Fla of cirrhosis of the liver

George Washington Billig @ Chicago Bennett College of Eclectic Medicine and Surgery Chicago, 1898, College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois 1901, on the staff of Swedish Covenant Hospital, aged 65, died, June 7, of cerebral hemorrhage

Arthur Leil Leeds, Phoenix, Ariz Hahnemann Medical College and Hospital, Chicago 1902 College of Physicians and Surgeons of Chicago School of Medicine of the University of Illinois 1904 for many years associated with the Indian Service aged 72 died May 7 of aneurysm of the aorta

Frank M Tracy Kansas City Kan College of Physicians and Surgeons Medical Department, Kansas City University, Kansas City 1899, formerly county coroner and member of the city council aged 84 died May 3 in St Margaret's Hospital of coronary sclerosis and hypostatic pneumonia

Gavin Hamilton, Houston Texas McGill University Faculty of Medicine, Montreal Que Canada, 1894 fellow of the American College of Surgeons formerly on the staffs of the Memorial and Hermann hospitals aged 70, died May 26 of heart disease

Gustus Brinton Hepp Denver Northwestern University Medical School Chicago, 1891, member of the Colorado State Medical Society on the staffs of St Luke's St Joseph's and St Anthony's hospitals, aged 76 died, May 26 of cerebral hemorrhage

Thomas B Snoddy, Pala, Calif, College of Physicians and Surgeons, Little Rock, 1911, for many years physician in the Indian Service, aged 65, died May 1, in the Mercy Hospital San Diego, of pneumonia, diabetes mellitus and tuberculous meningitis

Horace Shaughnessy E Root, New York, Queen's University Faculty of Medicine, Kingston, Ont, Canada, 1924, until recently was employed by a construction company in Honolulu, Hawaii, aged 40, died suddenly, May 5, of coronary occlusion

William Thomas Harvell, Oakland, Tenn, Memphis (Tenn) Hospital Medical College, 1899 served during World War I, aged 66, died, May 6 in the Veterans Administration Facility, Memphis, of encephalomalacia of the occipital lobes

William A Cotton, Escanaba, Mich, University of Michigan Homeopathic Medical School Ann Arbor, 1889, member of the board of directors of the Pinercrest Sanatorium, Powers, aged 78 died, May 26, in St Francis Hospital

Edward LeRoy Barnett @ New York, Columbia University College of Physicians and Surgeons New York, 1899, formerly on the staff of the Hospital for Ruptured and Crippled, aged 68, died, June 7, of coronary thrombosis

Philip Schmitt, Milwaukee, Jefferson Medical College of Philadelphia 1883 member of the State Medical Society of Wisconsin aged 82, died, May 26, in the Milwaukee Hospital of carcinoma of the left tonsil

Bryant Hooper Trewyn @ Peoria Ill, St Louis University School of Medicine, 1925 president of the local board of education, on the staff of St Francis Hospital aged 41, died, June 9 of heart disease

Adolph Noha, New Orleans, Medical Department of Tulane University of Louisiana New Orleans, 1890, member of the Louisiana State Medical Society, aged 80, died, May 29, of chronic nephritis and uremia

Benjamin Victor Howard, Knoxville Tenn, Vanderbilt University School of Medicine, Nashville 1912, formerly member of the state board of nurses examiners, aged 53, died May 24 of coronary occlusion

Henry Worst Sweigart, Lewistown Pa University of the City of New York Medical Department, New York 1890, member of the Medical Society of the State of Pennsylvania, aged 76 died May 18

George Chauncey Wrigley @ Sonora, Calif College of Physicians and Surgeons of San Francisco, 1909, served during World War I, aged 57, died, May 1 of a skull fracture received in a fall

Alexander W Burch Lincolnton, Ga, University of Georgia Medical Department, Augusta 1889 for many years member of the board of education and city council, aged 76, died, April 17

William Henry Weed Hinds, Milford N H, Boston University School of Medicine, 1895 member of the New Hampshire Medical Society, aged 74, died March 10, in Wilton

Andrew Wesley McClennan, Toronto Ont, Canada, University of Toronto Faculty of Medicine 1907 formerly on the staff of the Toronto Western Hospital where he died, May 9

Harold J Hoover, Grand Ledge Mich, Saginaw Valley Medical College Saginaw 1903 aged 67 died, May 4 of chronic nephritis hypertension and angina pectoris

George Clinton Kilgore, Gloucester City N J Baltimore Medical College 1895 aged 73, died May 11, of laryngeal carcinoma

Charles Edward Windeler, Chicago Medical College of Ohio, Cincinnati, 1900 aged 64 died May 9 of organic heart disease

## DIED IN MILITARY SERVICE

Frederick Talmadge Rice @ Major U S Army retired registrar at the new U S Army Hospital (Hoff General Hospital) Santa Barbara Calif Hahnemann Medical College and Hospital, Chicago 1907 entered the medical corps of the U S Army as a captain in 1920 and retired with rank of major in 1929 for disability in line of duty served during World War I recalled to active duty May 7 1941 aged 61 was killed May 7 in an automobile accident

## MISBRANDED PRODUCTS

Abstracts of Notices of Judgment Issued by the Food and Drug Administration of the United States  
Department of Agriculture

[EDITORIAL NOTE—These Notices of Judgment are issued under the Food, Drug and Cosmetic Act and in cases in which they refer to drugs and devices they are designated D D N J and foods, F N J. The abstracts that follow are given in the briefest possible form (1) the name of the product, (2) the name of the manufacturer, shipper or consigner, (3) the date of shipment, (4) the composition, (5) the type of nostrum, (6) the reason for the charge of misbranding and (7) the date of issuance of the Notice of Judgment—which is considerably later than the date of the seizure of the product and somewhat later than the conclusion of the case by the Food and Drug Administration.]

**Anti Poison**—Anti Poison Medicine Company, Springfield, Mo. Oct 11, 1939 Composition essentially extracts of plant drugs including an astringent alcohol (121 per cent by volume), water and a trace of an ammonium compound. Misbranded because label falsely represented the product as an effective treatment and cure of chills, malaria, eezema, scrofula, cholera morbus reptile and insect bites, rheumatism, lung hemorrhages, asthma, female troubles, la grippe, coryza, "blood poison of every description," tumorous cancer, stomach and bladder diseases and many other disorders. Further misbranded because represented to contain 20 per cent of alcohol and to be an anti poison, anti septic and "the best blood medicine on the market"—[D D N J, F D C 304, November 1941]

**Coston's 6 and 3 Herb Compound**—C S Coston, Lockwood, Tenn. Jan 17, 1940 Composition essentially plant drugs including a bitter (aloe), an alkaloid bearing drug, a laxative drug, a trace of sodium benzoate, sugar and water. Misbranded because falsely represented on the label to be a stomachic, diuretic and laxative and a remedy for stomach, liver, kidney, blood and nervous disorders, rheumatism and some other things.—[D D N J, F D C 306, November 1941]

**Deane's Adhesive Bandage**—Deane Plaster Company, Yonkers, N Y. June 29, 1940 Misbranded because of following false and misleading claims in labeling "First aid for minor cuts. Wounds. Apply the gauze pad directly over the wound. Will afford complete protection from the cut or wound" whereas specimen examined was found to be contaminated with viable micro organisms. Further misbranded because label did not bear the name and address of the manufacturer, picker or distributor.—[D D N J, F D C 320, November 1941]

**Diabet-Tea**—Diabet Tea Company, Scranton, Pa. Sept 11, 1940 Composition ground *hypericum perforatum*, commonly called St. John's wort. Misbranded because of false statement on label "Nature's Good Diabet Tea for Diabetes. The contents of this package has been carefully prepared for the use of those who suffer from diabetes" and because label did not bear the common or usual name of the drug which comprises the preparation.—[D D N J, F D C 307, November 1941]

**Dr Seth Hart's Croup Syrup**—Parker Medicine Company, Athens, Ohio. Jan 8, 1940 Composition essentially sugar, water, extracts of plant drugs and 3 per cent of alcohol. Not efficacious for coughs, croup, acute bronchitis, pleurisy or inflammation of the lungs as represented, and hence misbranded.—[D D N J, F D C 311, November 1941]

**Fru-Lax**—Fru-Lax Company, Chicago. Between April 8 and July 9, 1940 Composition essentially purging tissues of cassia, senna leaf and carob bean. Misbranded because label falsely represented that it was not habit forming, that it would restore health and relieve ailments caused by poisons absorbed from the bowels, that it was an effective treatment of rheumatism neuritis, stomach disorders, gallbladder trouble, headaches, certain skin ailments, colds, hemorrhoids high blood pressure and some other things that it was an ideal neutralizer" which would make the body disease proof and that it possessed rejuvenating and restorative properties.—[D D N J, F D C 340, March 1942]

**Kotalko**—Kotalko Sales Company, New York. Feb 20, 1940 Composition not stated. Labeled in part "For the Scalp—Kotalko—For the Hair". Misbranded because misrepresented as to net weight of contents and because container was deceptive.—[D D N J, F D C 315, November 1941]

**Lenmar Company's Infra Red Lamp**—Lenmar Company, Los Angeles. July 26 1939 Description a heating element screwed into a table type lamp base. Misbranded because label falsely represented the lamp as giving forth "healing rays from the sun" that penetrate deep into the flesh, stimulating the nerves and causing greatly increased circulatory action, which destroys infectious rebuilds diseased tissue and promotes bodily health and vitality, will relieve suffering from asthma, neuritis, stiff swollen joints, sinus trouble and rheumatism. breaks up congestion indicated by acute pain and poor circulation. Women experiencing trouble at menstruation will find comforting relief by using this. Infra Red rays are also very beneficial in the treatment of inflammation of the gall bladder, hysterical nervous diseases, inflammation of the various bones, membranes and inflammation of the joints"—[D D N J, F D C 299, November 1941]

**Lightning Hot Drops**—Herb Medicine Company, Springfield, Mo. Jan 2, 1940 Composition ether, chloroform and alcohol. Misbranded because ingredients present in smaller amounts than those declared on the label as "Each fluid ounce contains 48 minims of chloroform, minims of ether, alcohol 60% by volume"—[D D N J, F D C 318, November 1941]

**Maurice Le Bell's Formula No 7**—Hollywood Formulas, Inc., Los Angeles. Sept 11, 1940 Composition tablets containing Irish rhubarb root seaweed, parsley leaf, cranberry fruit and leaves reducing celery. Misbranded because of false statements on the label such as "As recommended by Hollywood's famous Dr Maurice Le Bell D C reducing specialist" and in booklet, "Instructions contained in this booklet are a vital part of your reducing program" and "simplified form of the famous reducing methods used by Dr Maurice Le Bell D C, in his many years of private practice"—[D D N J, F D C 341, March 1942]

**Miracle Lotion**—Martinsville Laboratories Inc, Martinsville, Va. July 1, 1940 Composition isopropyl alcohol 60 per cent by volume, salicylic acid, benzoic acid, water, perfume and a green coloring material. Misbranded because label falsely represented that the product was good for scalp diseases dandruff falling hair and skin disorders in general such as itch ringworm and pimples, and, in addition, aching joints muscles and some other conditions. Further misbranded because amount of the ingredients not accurately declared on labeling nor was quantity or proportion of alcohol correctly stated.—[D D N J, F D C 298, November 1941]

**Odell's Quinine for the Hair**—Odell Company, Newark, N J. Nov 19 1940 Composition not reported. Misbranded because name falsely represented that the product contained quinine, which it did not further misbranded because label did not bear common names of the active ingredients or a statement as to amount or proportion of alcohol present.—[D D N J, F D C 297, November 1941 C N J, F D C 31, January 1942]

**Oster Massagett**—John Oster Manufacturing Company, Racine, Wis. Jan 18, 1940 Description "an electric motor so constructed as to vibrate when it revolved, and fitted with an attachment whereby it vibrated clamped to the back of the hand". Misbranded because label falsely represented that this device would be efficacious for development and preservation of good health, stimulate blood circulation eliminate congestion and banish localized pain, would give some relief in acute types of arthritis and delay the progress of chronic arthritis, would be of great value in the treatment of sprains and bruises by restoring the blood circulation, would ease stiff joints and separate adhesions therefrom would penetrate deeply into the stomach and intestines with sufficient force to help normalize the natural functions of the digestive organs and be effective in mental fatigue, headache, nervousness, insomnia and nerve prostration and many other disorders.—[D D N J, F D C 309, November 1941]

**Purity Pine Disinfectant**—Wilco Laboratories, Inc, New York. Sept 29, 1939 Composition soap, water and pine oil. Misbranded because falsely represented in labeling as effective in the treatment of minor cuts and wounds.—[D D N J, F D C 310, November 1941]

**Samson Therapeutic Lamp**—Samson United Corporation, Rochester, N Y. Between Nov 25, 1939 and Jan 2, 1940 Description a table type lamp fitted with a heating element. Misbranded because of following false and misleading claims in accompanying circular "Excellent for relief of arthritis, lumbago, cramps, colds, sprains etc. Designed by prominent engineers and approved by outstanding local authorities, this therapeutic lamp, used a few minutes daily, brings health, beauty and vitality. Care of hair. General application of therapeutic rays every night will keep scalp healthy and improve circulation. Colds. Apply rays to back of neck and down along spine to relieve congestion. Cramps. rheumatism. menstrual pains. insomnia. backache. skin ailments. Therapeutic rays stimulate pores, eliminate all impurities and sterify tissues. Invaluable in treatment of acne, corns feet, dry skin, chapped wrinkles blemishes, etc"—[D D N J, F D C 300, November 1941]

**Slendotabs**—Keneo Products, Elmira, N Y. May 18, 1940 Composition in each tablet, approximately 1/2 gram of phenolphthalein in addition to a resinous drug such as leptandra resin, compounds of equivalent to 0.088 gram of iodine per tablet and alkaloidal resin including strychnine. Misbranded because falsely represented on label to reduce excessive fat effectively, to be a scientifically balanced reduction method and to help eliminate waste matter and accretions from the body, further misbranded because label failed to state the presence of strychnine or to declare the amount thereof, and the user that the product might be dangerous to health in cases of appendicitis and might cause skin eruption and other on laxatives.—[D D N J, F D C 342, March 1942]

**Wittone**—Wittone Sales Agency of United Distributors Inc, Louisville, Ky. About May 1940 Composition essentially a solution of epsom salt with almost negligible amounts of iron and citrate and the salicylate, phosphate and bicarbonate of sodium and a flavoring material. Misbranded because label falsely represented that it be efficacious for the health to help one eat and sleep well, banish spells dizziness headaches sour stomach and other orders and keep the system free from impurities. Further misbranded because among other things the "tone" part of the name gave the false impression that the product acts as a tonic. Further misbranded because label did not warn against use of the product by children, to whom its use might be dangerous. Further misbranded because continued use, which might establish dependence on it.—[D D N J, F D C 344, March 1942]

## Correspondence

### AVERAGE AGE OF PHYSICIANS AT DEATH

*To the Editor*—The analysis of the statistics obtained from the obituary list of *THE JOURNAL* (Deaths of Physicians in 1941 editorial June 13 p 565) reminds me of an interesting finding gleaned from that section some time ago. Weekly review of that column never failed to arouse my curiosity as to the average age of the physicians whose deaths were reported at the top of the list compared to that of those at the bottom.

It seemed an unusual opportunity to determine what price success or probably, more correctly prominence. From this information the life span of the physicians who attained position and prestige could be compared to that of those who appear to have lived under less stress among their patients.

To satisfy this curiosity, our resident, Dr Mortimer Canuel averaged the age of the first and the last ten of each column of thirty successive issues of 1939. On compilation of these figures we learned that the average age of those high in the list was 64.6 years as against 69.3 years for the lowermost ten—a difference of 4.7 years.

RICHARD A. RENDICH, M.D., Brooklyn

### ARTERIOSCLEROSIS AND VARICOSE VEINS

*To the Editor*—In the paper on arteriosclerosis and varicose veins by Drs Lake, Pratt and Wright (*THE JOURNAL*, June 27 p 696) appears the statement "Although years of study by numerous workers have been devoted to this great enigma of biology, it can be fairly stated that today it is not known whether arteriosclerosis should be considered as a disease or as a purely degenerative process."

The arterial lesions that are discussed in this paper are largely due to atherosclerosis after primary spasmodic processes and the minor Monckeberg's sclerosis are excluded. Atherosclerosis is not a "purely degenerative process." It is a complex disease as specific in character as the infectious diseases. Unlike so-called senile sclerosis a negative condition due to passive dilatation of weakness of arterial walls, atherosclerosis is an active disease of positive quality which may even be characterized as an aggressive disease when it kills robust boys in the twenties with the highly selective process coronary sclerosis.

The only criteria that we have for demonstrating the causative relation of a given agent to a disease are Koch's postulates applied to infectious diseases. They require that the agent shall be found constantly in the lesions of the disease, shall be isolated in pure culture and shall reproduce the lesions of the disease when introduced into susceptible animals. We have been compelled to make compromises with Koch's laws in some infections because we cannot cultivate the suspected agent, or susceptible animals cannot be found or for other reasons.

Cholesterol visible under the polariscope is normally limited to the adrenal cortex, myelin sheaths, interstitial testicular cells and sometimes corpora lutea. Visible cholesterol in other sites in the body is associated with disease. It is excess cholesterol. Ester cholesterol can be identified in the tissues by its specific crystals more readily than can bacteria. It has been demonstrated that excess cholesterol is an irritant comparable to a degree with silica. Visible cholesterol is always present in the lesions of atherosclerosis. It is the distinguishing mark of this form of arteriosclerosis. It can be extracted from the atherosclerotic lesions. When fed to rabbits in adequate dosage it will reproduce the lesions of human atherosclerosis with more

exactness than can the lesions of many infectious diseases be reproduced by the introduction into susceptible animals of the accepted bacterial causes of these diseases (*Arch Path* 32 507 [Oct] 1941). No compromises with Koch's postulates are necessary in determining the causative relation of excess cholesterol to atherosclerosis.

Atherosclerosis, the important form of arteriosclerosis, is a specific disease due to excess cholesterol.

TIMOTHY LEARY, M.D., Boston

### "RADIATION THERAPY OF PROSTATIC CARCINOMA"

*To the Editor*—In the able survey of the present day therapy in cancer of the prostate there appears to have crept into the Query and Minor Note of March 7 at least one inaccuracy. The author of the answer says "once the clinical diagnosis of carcinoma of the prostate has been made it is technically impossible to do any sort of surgical procedure that would effect a cure." As far as the surgical cure of this highly malignant disease is concerned that has been answered by Drs Hinman, Lowsley and Young in their communications of June 20. As far as irradiation goes I have reported two authenticated five year cures proved by pathologic specimen before treatment (by radon needles) and proved carcinoma free at autopsy five years later (*J Urol*, March 1942).

In the same article I reported that of 352 patients 21 (6 per cent) lived more than five years, apparently free from carcinoma for periods between five and nineteen years: 5 for five years, 6 for six years, 1 for seven years, 2 for eight years, 2 for nine years, 1 for ten years, 1 for twelve years, 1 for thirteen years, 1 for sixteen years and 1 for nineteen years. In but 10 of these cases was the diagnosis made pathologically. In 3 cases the diagnosis was by aspiration biopsy, and in 8 cases the diagnosis was made clinically.

Aspiration biopsy is a decided step in advance whereby to prove pathologically the presence of early carcinoma. This method stressed for many years at the Memorial Hospital has been largely neglected by urologists. It has proved in our hands a valuable method of diagnosis not always succeeding, but when positive serving as an important means of early diagnosis.

Orchiectomy as advanced by Huggins marks a milestone in progress. He has shown that 5 out of 45 patients with advanced prostatic carcinoma with metastasis are apparently free from disease the longest having gone some thirty-two months after this operation.

BENJAMIN S. BARRINGER, M.D.,  
Memorial Hospital  
New York

### PURKINJE AND THE ORIGINS OF OPHTHALMOSCOPY

*To the Editor*—To your editorial Purkinje and the Origins of Ophthalmoscopy in *THE JOURNAL* May 23 page 348 I object that you spell Purkyně's name in three different ways: Purkinje, Purkine and Purkyně, the last one being correct.

John Evangelist Purkyně was born in 1787 in Bohemia of Czech parents and died in 1869 as a professor of the Charles University in Prague. He was the founder of the modern Czechoslovak medicine.

Although the American textbooks spell his name Purkinje, the correct spelling of his name is Purkyně and the correct pronunciation is Poor-ki-ne.

Otherwise I thank you for giving proper credit to my great countryman.

KARLIL JAROMIR NEUMAN, M.D., Schenectady, N.Y.

## Council on Medical Education and Hospitals

### CONTINUATION COURSES FOR PRACTICING PHYSICIANS

In accordance with the plan of the Council on Medical Education and Hospitals, advance information concerning continuation courses for practicing physicians available in the various centers is published quarterly. The following list consists of courses

beginning during the period July 20-Oct 20, 1942. It is hoped that this material will be useful to the practicing physician who is planning to take postgraduate work but does not have a ready means of knowing when and where the subjects in which he is interested will be taught. Since many of the classes are necessarily limited, those who contemplate enrolling in any of the courses are urged to communicate as early as possible with the proper executive officer.

H. G. WEISKOTTEN, M.D.,  
Secretary, Council on Medical  
Education and Hospitals

1 Specialists who have had adequate preliminary training and experience

2 If two or more students register for the course at the same time a reduction in the fee will be made

3 Special parts may be taken

4 A registration fee of \$3 covers all courses taken within the year

5 Grants may be made from a scholarship fund

6 Register two to six weeks in advance

7 A temporary license to practice medicine in the state is required

8 Physicians who have had adequate preliminary training and/or are approved by the postgraduate department

9 Arrangements may be made to take individual sections of the course at a reduced fee

10 If taken in conjunction with the next course above/below (Gastroscopy/Peritoneoscopy) the fee for the combined course will be \$125

11 Male physicians only

12 Repeated at intervals throughout the year

13 Ten physicians twenty nurses and twenty physical therapy technicians

14 For representatives of the chapters of the National Foundation for Infantile Paralysis and others who may be qualified

15 Preference is given to those registering for the longer course

16 Officers in the Medical Department on active duty

17 Officers on active duty at one of the hospitals

18 For officers of the United States Army or Navy or the United States Naval Reserve on active duty

19 Interns house officers and senior medical students who may become medical officers in the armed forces

20 Medical Reserve Officers United States Army

21 Physicians attached to the Emergency War Service of Western New York

22 Given at separate hospitals for white and Negro physicians

23 General practitioners licensed to practice in the state

24 Per diem and/or maintenance provided

25 Longer sessions arranged in units of 12 sessions each

26 Microscope required

27 Plus a nominal laboratory fee

28 Holders of Commonwealth Fellowships and a limited number of other qualified physicians

29 Course open only to those who intend to enter Government hospitals

30 Assistantships internships residencies available in the fields named

31 May be taken mornings or afternoons only at half the fee

32 Fellows of the academy registered without fee

33 A faculty course for staff members of mental institutions

34 Assigned reading monthly conferences one week of instruction in residence

35 Registered physicians of New York State who wish to qualify as Health Officers Grade II

36 Plus \$10 for the required textbook

37 Supplementary to course completed at the Trudeau School of Tuberculosis on October 9 1942

38 Physicians who have completed the course at Trudeau have already paid their fees

39 Includes tuition for a supplementary 2 week course sponsored by Columbia University Faculty of Medicine

40 For members of the American College of Physicians and qualified doctors seeking membership or certification in the American Board of Internal Medicine

41 Given in New York City

42 Given in Boston Mass Philadelphia Pa Rochester Minn and Minneapolis Minn

43 For members of the society

44 No tuition charge to interns residents and students

45 Physicians selected by the National Office of Civilian Defense

46 Venereal disease clinicians in Alabama a few out-of-state physicians may be accepted

47 Tuition travelling expenses or maintenance provided by the state board of health

48 Plus a matriculation fee of \$10

### MEDICOLEGAL ABSTRACTS

**Medical Practice Acts Accused Entitled to Bill of Particulars**—An information filed against the petitioner charged that he "did wilfully, knowingly, and unlawfully practice medicine within the State of Montana without first having obtained a certificate to practice as provided by law. The petitioner filed a motion for a bill of particulars, which was denied. He therefore applied to the Supreme Court of Montana for a writ of supervisory control directing the district court to grant an order requiring the state to furnish such bill.

The petitioner contended that the information did not sufficiently apprise him of the nature of the accusation to enable him to prepare his defense and that the refusal to grant him a bill of particulars was a violation of his constitutional rights to demand and be informed of 'the nature and cause of the accusation'. The respondents contended that there was no statute in Montana authorizing or giving a court a right to require the state to furnish a bill of particulars in a criminal case. The Supreme Court said, however, that it had previously recognized the existence of such a right and stated the general rule to be that when an indictment does not clearly set forth the charge against the accused he may move for a bill of particulars for specification of the acts on which the prosecution intends to rely and such motion will be granted whenever it appears to be necessary to enable the defendant to meet the charge against him.

The respondents next contended that the information did in fact sufficiently apprise the petitioner of the charge against him. The medical practice act provides that it shall be a misdemeanor to practice medicine or surgery without a license and then states disjunctively numerous acts the doing of which constitutes the practice of medicine. The Supreme Court pointed out that the offense could thus be committed in a number of ways and said that the accused was entitled to know what the state was relying on as constituting the practice of medicine. So far as the right of the accused to a bill of particulars is concerned, the court pointed out, a prosecution under the medical practice act is analogous to one for violating the traffic regulation statute. A person can be guilty of a misdemeanor by doing any one of twenty-two different acts regarding the use of the highways and each act would be a distinct and separate offense. Certainly an accused in a prosecution under that statute would be entitled to know what particular subdivision of the statute he was accused of violating. In the opinion of the court, the petitioner in this case was entitled to a bill of particulars in order to ascertain which act or acts the state was relying on as constituting the practice of medicine, or at least which portion of the statute he was accused of violating. By pleading not guilty the petitioner did not waive his right to a bill of particulars.

The writ of supervisory control requiring the furnishing of a bill of particulars was accordingly granted—*State ex rel Hong Sun v. District Court of First Judicial District in and for Lewis and Clark County*, 113 P. (2d) 996 (Mont., 1941).

**Statute Authorizing Commitment of Criminal Sexual Psychopathic Persons Constitutional**—A Michigan statute (Act 165 Public Acts of 1939) which defines a criminal sexual psychopathic person as any person not insane or feeble-minded, suffering from a mental disorder coupled with criminal propensities to the commission of sex offenses authorizes the attorney general or the appropriate prosecuting attorney when any such person is charged with a criminal offense to file with the clerk of the court in the same proceeding wherein the person stands charged with such criminal offense a statement in writing setting forth facts tending to show that the defendant is a criminal sexual psychopathic person. The trial court is then

to appoint two qualified psychiatrists to examine the accused and to file with the court a report in writing as the results of their examination together with their conclusions and recommendations. The court subsequently is to hold a hearing to determine whether or not the accused is a criminal sexual psychopathic person and, if such a finding is made, the court is then to commit the accused to the state hospital commission to be confined in an appropriate state institution under its jurisdiction until the accused has permanently recovered from such psychopathy. The defendant Chapman, was charged with an act of gross indecency but before trial on the charge the appropriate prosecuting attorney filed a petition with the court alleging that the defendant was a criminal sexual psychopathic person and the trial court appointed two psychiatrists to examine him as contemplated in the statute referred to. The psychiatrists reported in substance to the court that, while there were many suggestive signs and symptoms of schizophrenia in the defendant they would not make a diagnosis of actual psychosis (insanity) at that time. However, they did state that the defendant had a psychosexual deviation was homosexual and had suggestive symptoms of simple schizophrenia. They stated that his psychosexual deviation was likely to assume "a much more ominous manifestation, that of pedophilia." The trial court subsequently, after a hearing determined that the defendant was a "criminal sexual psychopathic person" and committed him to the state hospital commission to be confined in an appropriate institution. The defendant then appealed to the Supreme Court of Michigan, questioning the constitutionality of the statute under which he was committed.

The defendant contended that the trial court was without jurisdiction to determine that he was a criminal sexual psychopathic person because the report of the psychiatrists found him to be insane and that, if he was insane under the statute he could not be committed as a criminal sexual psychopathic person. If the defendant, said the court had been found to be insane, he would not have been subject to commitment. The report of the psychiatrists, however stated that, while there were many suggestive signs and symptoms of schizophrenia, a diagnosis of actual psychosis (insanity) was not made at that time and that further observation might establish the presence of that mental disorder. The report indicated long indulgence by the defendant in perverted sexual behavior, lack of inhibitions, peculiarities, flights of fancy, numerous abnormalities and symptoms of schizophrenia. While these symptoms are indicative of a psychopathic personality they do not constitute a finding that the defendant was insane.

The court did not agree with the next contention of the defendant that the trial court was without jurisdiction to commit him as a criminal sexual psychopathic person because the psychiatrists report did not make a finding that he was not insane, which finding he claimed, was required under the statute. The purpose of the psychiatrists' report said the court, was to inform the trial court whether or not it was reasonable and proper to proceed with the hearing in order to determine whether or not the defendant was a criminal sexual psychopathic person. The report served that purpose. It was then for the trial court, with or without a jury, to determine whether the defendant was a criminal sexual psychopath. The trial court concluded that the evidence adduced satisfactorily established that fact. The proceedings in this case in many respects are analogous to proceedings for the commitment of a person alleged to be insane. The question of insanity is factual and the finding of the trier of facts is binding on appellate courts if there is evidence to support such a finding. That same rule of law, in the opinion of the court, applies to the instant situation, and the court concluded that the trial court had jurisdiction to conduct the proceedings and to make the order of commitment.

The defendant next contended that the statute in question denies the equal protection of the laws guaranteed by the Michigan and federal constitutions because it limits the class of criminal sexual psychopathic persons who might be brought within its provisions only to those who are charged with a criminal offense and that such classification makes the statute unconstitutional as class legislation. It is well recognized

answered the court, that the legislature may make classifications of persons provided such classifications are based on substantial distinctions and are in accord with the aims sought to be achieved. Such classification, however, must be neither arbitrary nor capricious but must rest on reasonable and justifiable foundations. Was there a sound and logical basis for the legislature in enacting the act in question to restrict its operation to "criminal sexual psychopathic persons charged with a criminal offense?" It is reasonable to presume that the legislature concluded that the need for such restraint as the statute imposes was greatest among that group of criminal sexual psychopathic persons apparently predisposed to transgressions against society, that is, those persons charged with other violations of the criminal law. We believe it is a reasonable and justifiable assumption that the class of sexual psychopathic persons most dangerous and most likely to commit sex crimes is that class which engages in other criminal conduct. The legislature, in the exercise of its state police power and in its efforts to afford protection, could limit the scope of a legislative act to the eradication of evil where presumably the need is greatest, even though it might constitutionally have extended the operation of its enactment to a larger class. In support of this conclusion the court quoted as follows from the opinion of the Supreme Court of the United States in *State of Minnesota ex rel Pearson v Probate Court*, 309 U. S. 270, 60 S. Ct. 523, in which a Minnesota statute providing for certain restraints for a "psychopathic personality" did not deny such a person equal protection of the laws.
